"See its cheeks and its sweet little nose. All it needs is to have a face painted on and a body and some clothes. Every time that we make a hickory nut into a doll we'll be rescuing it from a boy or a squirrel, Sarah."

"You fill the pockets of your coat with nuts, and I'll fill my hood. It's so fine to feel the wind in your hair, and my ears are as warm as stoves. Come on, Sarah, we'll go over to the woods and pick up as many nuts as we can, and may be we can find homes for the dolls when they're done. I'm the president of the Dolls' Rescuing League, but you may be the vice-president, and the secretary, and the treasurer, Sarah."

All the long, sunny morning the two little girls bent over the ground, gathering nuts. Polly Anne, in her coat made of Grandmother Tibbet's plaid shawl and holding her red worsted hood, looked like a little forest dryad as the wind tossed her brown curls and painted her cheeks crimson. When Mother Tibbets, standing in the door of the little brown house, rang the big dinner bell to call Polly Anne and Sarah, they had enough nuts to make a whole orphan asylum of dolls.

There were crisp, hot baked potatoes for dinner, and steak, a wonderful treat in the Tibbets family, but the Dolls' Rescuing League was even more fascinating.

"Don't eat so fast that you'll choke yourself or burn your mouth, Sarah," Polly Anne said, as they all, mother and grandmother, John Henry and Rufus Adolphus, the baby sat around the table in the kitchen; "but don't waste any time eating, dear, I've got such plans in my head for making the dolls; and you, John Henry, will have to help, too, so we must finish dinner as soon as ever we can."

When dinner was over and the dishes were washed, Mother Tibbets let the children have the whole kitchen table to work on. It was pleasantly warm in the kitchen, and the kettle sang shrilly from its place on the stove as the children drew their chairs up to the table and spread the nuts out ready to begin the work of the Dolls' Rescuing League.

"You must make the dolls' bodies, John Henry," Polly Anne directed. "Your jackknife is so nice and sharp, and you can just whittle pointed sticks from some of the softest pieces of wood in the kindling box. Bore little holes in the nuts and glue the bodies in the holes. I'll make the dolls' faces, and as soon as John Henry gets a doll's body done, Sarah can glue on rolls of white cloth for the arms and legs. Grandmother gave me her piece bag for the clothes. Oh, aren't we going to have a perfectly beautiful afternoon, and aren't you glad we formed the Dolls' Rescuing League?" Polly Anne rocked her little thin arms in an ecstasy of delight.

It was surprising how the nuts wanted to be rescued and how fast the dolls multiplied under the clever fingers of the leaguers. Polly Anne painted eyes and red cheeks and crimson lips on each wrinkled nut face, and then John fitted it to its body in less time than it takes to tell about. The little rag arms and legs that Sarah made would bend like real human ones, and then came the fun of dressing the nut dolls. It was such very jolly fun that even dear Grandmother Tibbets couldn't resist joining the children, and her fingers flew,

too, as she helped to make little underclothes and all sorts of pretty dresses.

One nut doll was Red Riding-Hood, her little brown face peeping out from a round red hood that topped a red cloak made of a scrap of flannel from Grandmother Tibbets's wonderful piece bag. Another was a little grandmother in a white cap, a gown of gray calico and a red and white frock; and there were other dolls, too, just little girl dolls in print frocks and with bows of ribbon glued to the top of their nut heads.

"There," Polly Anne said, as she stood the dolls on up the window sill. "Think what we've rescued you from! You might, every single one of you, my dears, have been eaten by this time, and here you are dressed up all spick and span and ready to be adopted. We'll

MORE LIGHT THAN 20 OIL LAMP S

DREADNAUGHT
BLAZING AWAY IN COST-DEFENCE!

Mother's Nose

We sometimes wonder if mother has eyes in the back of her head—she knows about things we cannot even see or feel. The truth is, mother's nose is a lightning circulator—one sniff and it's all added up and she has the correct answer. How did she know that Johnny "fell" into the lake and dried his clothes in the sun?—How does she know when the heat is right and everything cooked properly?—Because her "nose knows" and she knows it knows.

It's positive knowledge with mother; no "guess" work goes—so it is with a Dreadnaught Burner in the stove. The heat is always there and never varies—no worry about wood being cut and keeping up the fire; nothing to clean and carry out. The gas burns steady and even, without watching. A touch of the valve and the fire is out—expense stopped immediately. Let's take up this item of mother-help and adjust it for all time. You cannot do too much for mother—anyway, in this case a Dreadnaught Burner means as much help to you as mother. Write for our circular—we will be glad to send it.

keep one or two for ourselves, Sarah, and try to get the others adopted. O Sarah!" Polly Anne's eyes shone with excitement. "Wouldn't it be splendid to put them in the store, in Mr. Jonas' show case, where everybody can see them, and know how dreadfully in need of homes they are? Let's take them down now. There's plenty of time to do it before tea, and there's just a chance that some of them may get adopted tonight. No, dear. I'm so sorry, but you can't go with us."

Polly Anne gave Rufus Adolphus a big hug.

"You haven't got any whole shoes, you blessed baby, but some day sister'll buy you some."

It was almost a week before Polly Anne remembered the "candidates for adoption," as Mr. Jonas, the Sharon storekeeper, dubbed the nut dolls which Polly Anne and Sarah Tibbets left in his care. He was very nice about keeping them. He put them in a glass case right next to some lollipops, and he said he would try to call people's attention to their lonely state; but there were examinations in school, and Rufus Adolphus got the croup and had to be rocked all Polly Anne's spare time. It was not until the next Saturday that Polly Anne had time to go down to the store again, and she wouldn't have gone then except that the flour gave out, and she and Sarah had to take the cart to bring home another sack.

"Well, Sarah, we're a society if we are poor," Polly Anne said, as the two little girls trudged down the road to the village.

"I'm the president of the D. R. L.'s, and you're all the other officers, if I have got holes in my elbows and your rubbers do leak. Wouldn't it be fun if we should find that somebody had adopted a doll?"

There were a great many customers in the store when Polly Anne and Sarah reached it. The people who were buying thread, and buttons, and eggs, and sugar, and shoes, stood in front of the counter and quite covered up the case where the lollipops were. When Mr. Jonas had finished waiting on them, Polly Anne and Sarah pressed anxious little noses against the glass of the case.

There wasn't a doll there! "O Mr. Jonas! Was anybody good enough to adopt them?" Polly clasped and unclasped her red mittens. "Adopt 'em?"

Mr. Jonas leaned his kindly, smiling red face over the counter and beamed down on the little girls. He looked a little like a large hickory nut himself, for his face was wrinkled into a hundred benign puckers, and his nose was short and pointed. "Adopt 'em, Miss Polly Anne?" Mr. Jonas repeated.

"Why, bless your heart, they bought 'em! I could have sold twice as many of them nut dolls if I'd had 'em. Miss Jane Doyer she came in, and she says: 'Mr. Jonas, those dolls look just like Polly Anne's work. I must have five of them to send to my little niece.'"

"Then the writer man strolled in, and he bought two, 'for mascots,' he said. And all the others went before sundown to other folks who wanted 'em for different things, pincushions, and ornaments, and needle cases, and some for just plain dolls."

"We didn't make no business arrangements, Polly Anne," Mr. Jonas' eyes twinkled, "but I allowed 10 cents apiece was a fair price, and I took 1 cent of the 10 cents for case room. Business is business, you know. Here's your money. It's \$1.08."

Polly Anne never could think of anything to say when she was "flabbergasted," as dear grandmother put

it; but Sarah was always equal to the occasion.

"The land flowed with milk and honey," said Sarah, which had no very great connection with the matter in hand. "I'm the treasurer of the Dolls' Rescuing League, Polly Anne. You know you made me everything but the president, so I can spend the money. We'll buy Rufus Adolphus a pair of new shoes, red ones, dear; you know he needs them more than we need anything."

"O Sarah, you do think of the beautiful things, once in a while!" Polly Anne exclaimed as she hugged Sarah rapturously. "Have you any red shoes for a \$1.08, Mr. Jonas?"

"The very ticket for \$1," and Mr. Jonas drew out from behind the counter a pair of little red kid shoes with

silk tassels, and carefully pulled off the label marked \$1.50. "These fit the little fellow, and you'll have 8 cents left over to divide up between you."

It was wonderful how much that 8 cents bought,—a pencil box for John Henry, and ever so many lollipops for Polly Anne and Sarah Maud.

"Rufus Adolphus will look like a little Puss-in-Boots when he gets on these shoes," Polly Anne said as the two little girls went down the store steps and started home; "and I'm very sure they'll keep him from having croup because they're so high."

"Yes," Sarah acquiesced between rapturous bites of lollipop. "Isn't it strange, Polly Anne, what you can do if you organize into a society?"—Carolyn S. Bailey, in the Continent.

Durable-DURHAM Hosiery is a product of industrial democracy—never of child labor. We have no strikes or lockouts.

Lucky is the family with a wise hosiery buyer

More than money can be saved by a hosiery buyer who knows values—who knows the strength and honest quality of Durable-DURHAM Hosiery. There is comfort and economy for every member of the family in Durable-DURHAM. It wears longer because it is made stronger. It is good-looking but never flimsy. Darning is avoided. Ask your dealer to show you

An example of the many fine values in Durable-DURHAM Hosiery.

DURABLE DURHAM HOSIERY

FOR MEN, WOMEN AND CHILDREN
Made strongest where the wear is hardest

Every pair is strongly reinforced at points of hardest wear. The tops are wide and elastic; legs are full length; sizes are accurately marked; and the soles and toes are smooth, seamless and even. The Durham dyes will not fade.

GLORIANA (Banner)

You should be able to buy Durable-DURHAM Hosiery at any dealer's. Look for the trade mark ticket attached to each pair. If you cannot find this hosiery, we shall appreciate your writing direct to the Durham Hosiery Mills, Sales Department, 88 Leonard Street, New York, giving us the name of your dealer.

All year wearing stockings. Little finish. Extra fine gauge. Wide elastic tops. Strongly double reinforced heels and toes. Black, white and cordovan.

DURHAM HOSIERY MILLS, Durham, N. C.

Sales Office: 88 Leonard St., New York

You Can Buy An "Inexpensive" Piano Without Buying a "Cheap" One

There is a big distinction between the words "cheap" and "inexpensive." Some folks like to get things "cheap"—only to find that in the end they proved to be the most expensive—because a little while afterwards they had to buy another that would really give service.

Now we do not sell "cheap" pianos, but we do carry a number of "inexpensive" instruments. The prices are within the reach of most every home. These Pianos will render many years of satisfactory service—they are good, substantial values and are worth every dollar asked. We gladly arrange convenient terms of payment.

We invite you to call at any of our stores—or write us asking for illustrated catalog and prices.

We are dealers in Steinway and other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

Market Comment

Almonds Still Advancing.

Independent almond buyers in the Chico district, who opened the season by buying Nonpareils for 21 cents a pound, have closed some sales recently for 30 cents a pound, it is reported. Based on the total State almond crop last year—5,000 tons—Chico will harvest over one-third of the crop this year with a 2,000-ton yield.

Table Grapes Tested Before Sale.

Three hundred boxes of Thompson Seedless grapes were held up in Oakland this week at the request of Horticultural Commissioner Rouillard of Fresno, to be tested before selling. Table grapes must contain 18 per cent sugar before they can be sold for table use, otherwise must be disposed of for jelly or by-products.

California Beans Bounding.

Wholesale bean prices have increased \$1 per hundred pounds in the Sacramento Valley. Twenty carloads a day are being shipped from the State, which supplies 90 per cent of the beans consumed in the United States. High prices are indicated, as Michigan, Colorado and New Mexico have only 60 per cent of a crop.

Ungraded "Sweets" Unmarketable.

The sweet potato growers of Merced district claim they had no knowledge of any new grade laws being passed by the State Horticultural Commissioners at the time of the last Legislature. The first carloads shipped out of the Merced district were inspected and turned back. The growers have combined and are paying an attorney \$2.50 each to go to Sacramento and ask for a change in the grading laws.

Walnuts Above 1918 Figures.

A record walnut crop of 50,000,000 pounds, a yield 12,000,000 lbs. in excess of the 1918 output and 20,000,000 lbs. greater than in 1917, will be produced this year. These extra millions of output will come onto a bare market, and as the quality is of the best, fine prices are anticipated. A few Diamond Brand walnuts, sold by the Association in recent weeks have brought from 2 to 3 cents above the 1918 figures.

Cling Peaches Bring High Prices.

Growers of clings in the Sacramento fruit section are getting as much as \$110 a ton for fancy cling peaches, compared with \$60 last year. The two plants of the California Packing Corporation will do a business of \$3,800,000; the Smith-Frank Company near \$2,000,000; the Joseph Gerstring Company close to \$1,000,000, and the Libby, McNeill and Libby plant about \$7,500,000. The volume of cannery business is double that of last year.

Government Seizes Storage Eggs.

Seizure of 84,000 dozen eggs (1,008,000) in Chicago Wednesday stored for Morris & Co. by the district attorney probably started the downward trend in prices. It was charged that the eggs were unlawfully stored for the purpose of unreasonably increasing prices. This week saw more eggs taken from the local storehouses than were put in them, and at the present time local storage is some 2,000 cases short of a year ago at this time. Nevertheless, storage men are feeling nervous.

Tomato Shortage Boosts Prices.

From every tomato section, including San Benito, San Joaquin, Sacramento and Alameda counties, there is a report of only half a crop. The blight in the Sacramento district was unusually heavy. Late rains prevented preparing the ground for planting in Santa Clara county, and beetles combined with north winds have completed the damage in Sonoma. The average production for all districts is estimated at 8 tons an acre compared with the normal production of 15 to 20 tons. Santa Clara has the nearest to normal crop of canning tomatoes. Most canners have agreed on the minimum of \$15 a ton to growers, but it is likely that the price will rise if they keep their agreement to go higher if the season warranted it.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, August 13, 1919.

WHEAT.

A car shortage is interfering more or less in the shipments of wheat to this market, some dealers reporting a delay of over two weeks in the delivery of wheat from interior points of the State.

Per bushel—

BARLEY.

There were no changes in the quotations for spot barley this week, but futures were stronger. December sold at \$3.26 and May at \$3.25.

Feed	\$3.15@3.20
Shipping	\$3.20@3.30

OATS.

There was no change in the market for oats this week. The demand was light and sales were for small quantities.

Red feed, per cbl.	\$3.00@3.25
Red for seed	Nominal
Black for seed	Nominal
Recleaned Red or Black for seed	Nominal

CORN.

A good demand for California corn this week ran the price up to \$3.90 on some lots. Receipts have been light and shippers are apparently having trouble in getting cars to send their corn to market.

California	\$3.80@3.90
Egyptian, choice	Nominal
Milo	Nominal

HAY.

Receipts of hay for the past week were 2,727 tons compared with 2,655 the previous week, and as in the case of the previous week most of the receipts came in by boat. The car situation seems to be becoming more acute daily, and it is almost impossible to get box cars for hay shipments. As the complaint regarding lack of equipment for moving the crops seems to be quite general, it can hardly be expected that relief can be had in the near future. To make the situation worse the threatened railroad strike, together with the tie-up on the water front is unpromising. Prices have been well maintained and the demand for alfalfa is especially good.

No. 1 Wheat, per ton	\$15.00@17.00
No. 2 Wheat, per ton	12.00@14.00

Choice Tame Oat, per ton	15.00@17.00

FEEDSTUFFS.

The market for feedstuffs is strong. While the demand is not excessive, receipts in this market are below the normal and prices are being well maintained. Millrun shows an advance in price.

Brn	Not being marketed
Shorts	Not being marketed
Cracked corn	\$79.00@81.00
Rollod barley	\$66.00@67.00
Rollod oats	\$64.00@65.00
Alfalfa meal	\$36.00@37.00
Cocoanut meal	\$48.00
Oil cake meal	\$72.00@73.00
Millmix	\$59.00@61.00
Millrun	\$40.00@50.00

POTATOES, ONIONS, ETC.

Both potatoes and onions are weaker on account of the threatened railroad strike, and labor difficulties at the points of loading on the river and the local waterfront. Practically no shipments are being made out of the State at this time, as cars are scarce, and when available shippers do not care to risk the losses which might come from a railroad strike. River potatoes are becoming more plentiful in this market and will probably dominate it within a couple of weeks. Oregonians are getting very scarce and Idahoans are practically off the market. Bay tomatoes are arriving in good quantities now and sell for a higher price than the river product.

Belgian hares	15@16c
Jack rabbits	\$1.50@3.00

BUTTER.

Butter shows little fluctuation during the week, and quotations on the exchange were unchanged. Little butter is being shipped outside of the State at the present time on account of rail conditions, and local consumption with the movement towards storage has taken care of shipments to this market. Local storage shows but little increase during the past week, though in the big Eastern centers storage shows a gain of over two million pounds.

	Th.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	51½	52	52½	52½	52½	52½
Prime firsts	51½	51	51½	51½	51½	51½
Firsts	50½	50½	50½	50½	50½	50½

EGGS.

The production of eggs is showing a considerable falling off, and prices might be expected to increase at this season. But the fact that shipments have been practically shut off for the present put an element of weakness in the market and prices were lower than last week. A closer sorting of pullet eggs has developed a considerable quantity of smaller eggs which are now being quoted under the name of "Underzards."

	Th.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	56	55	56½	56	54½	53
Firsts	52	52	52	52	52	52
Ex. pullets	51½	51½	52½	52½	50	51½
Underzards	40½	40½	40½	40½	38½	38½

CHEESE.

The market on California cheese eased off for flats and firsts this week, while the Y. A. description maintained last week's quotation. Oregon cheese is not moving well at present prices, which, however, have been maintained unchanged. Receipts of cheese in this market about equal daily demands.

Fancy California, flats, per lb.	32c
do, Firsts	29½c
California Y. A.	34c
Oregon Triplets	33c
Oregon Y. A.	32½c
Monterey cheese	24½c

FRESH FRUITS.

The supply of cantaloupes continues heavy but prices have stiffened somewhat since those of last week. The demand for home-grown melons has apparently ceased, and while there are plenty in the market nothing like a standard quotation can be obtained. The Persian melon, however, is popular and sells readily at 2½ and 3 cents a pound. Apples are steady and in good demand at last week's prices. Strawberries are weaker and receipts higher.

Apples, New Red Astrakhan, boxes	\$1.25@2.00
do, Gravensteins	\$2.00@3.00

Watermelon, lb.	1½@1.50

CITRUS FRUIT.

Lemons are 50 cents lower on a lack in demand. Grapefruit continues to climb, as more is sold at the higher price than at lower. Oranges are unchanged.

Oranges, Valencia	\$4.25@4.50
Lemons, fancy	\$6.50@7.00
do, choice	\$5.50@6.00
do, standard	\$4.50@5.00
Lemonettes	\$3.50@4.00
Grapefruit	\$4.00@5.00

DRIED FRUITS.

Quotations on dried fruits were not changed this week, but the buyers are making no purchases at these prices. They want to see the result of the agitation over the high cost of living before they resume making contracts at present prices. While there is no indication that lower prices will prevail, it is

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., August 11, 1919.

Prices were somewhat lower this past week on Bartlett's than the week previous, due to a large proportion of the stock arriving ripe, and the markets were somewhat affected by the railroad strike situation, which up to the present has developed an embargo on some of the diverting lines, and the trade in some sections, not caring to buy in heavy supply, are picking rolling cars only when they feel that they can dispose of them without interference. The strike generally, has caused no serious damage to be done to date.

Northwestern pears have likewise affected the California pear market, though this condition will undoubtedly be overcome within the next two weeks.

The shipment of Sacramento River Bartlett's has discontinued and the movement from Suisun and Contra Costa county will be finished within a few days. The only available Bartlett's in any liberal supply will be from Placer and El Dorado counties.

The peach market continues very firm, with an upward tendency. California stock is arriving in good condition and meeting with favor with the trade. Indications are that the balance of the California peaches should clean up at very satisfactory prices.

Plum shipments continue light, the movement confined to a few varieties. The stock is carrying well and selling at the same high level as last week.

Thompson Seedless, where the stock is of good quality and condition is bringing good money, the demand being limited at prevailing prices and the shipments confined to the larger markets.

On account of the scarcity of refrigerator

cars, the shipment of Malaga has not been as heavy as it would be if the cars were freer. The demand is in keeping with the supply and prices satisfactory.

Tokays are coloring rapidly and though a few shipments have been made from the Winters and Vacaville districts, the movement from Florin and the Lodi districts will not begin until the latter part of the month.

Averages for the week:
NEW YORK: Bartlett Pears, \$3.65; Thompson Seedless, \$1.81; Malaga, \$2.26; Crawford Peaches, \$1.23; Elberta, \$1.37; Tuscan, \$1.59; Nectarines, \$1.66; Tragedy Plums, \$1.77; Diamond, \$2.07; Wickson, \$3.07; Sugar, \$2.11; California Red, \$1.80; California Blue, \$2.03; Bradshaw, \$1.42; Grand Duke, \$2.69; Burbank, \$1.72; American Blue, \$1.91; Kelsey, \$3.73; Duane, \$2.15; Giant, \$2.15; Gros, \$2.83; Columbia, \$1.80.

BOSTON: Bartlett Pears, \$3.28; Malaga Grapes, \$3.28; Thompson Seedless, \$2.14; Tuscan Peaches, \$1.69; Crawford, \$1.52; Elberta, \$1.65; California Blue Plums, \$2.37; Duane, \$2.20; Gros, \$2.27; Burbank, \$1.35; Diamond Plums, \$2.39; Wickson, \$3.80; Kelsey, \$4.02; Grand Duke, \$2.63; American Blue, \$2.21; Bradshaw, \$2.43; Tragedy, \$2.30; Giant, \$2.06; California Red, \$1.85.

CHICAGO: Elberta Peaches, \$1.23; Crawford, \$1.42; Tuscan, \$1.65; Malaga Grapes, \$3.05; Thompson Seedless, \$1.62; Bartlett Pears, \$3.96; Nectarines, \$3.00; Grand Duke Plums, \$2.31; Kelsey, \$3.40; Burbank Plums, \$2.65; Tragedy, \$2.12; Diamond, \$2.24; Gros, \$2.80; Giant, \$2.17; California Blue, \$2.45; American Blue, \$2.45; Bradshaw, \$2.15; Duane, \$2.35.

Special Citrus Market Report

Los Angeles, Aug. 12, 1919.

Best stock of Valencias continue to command satisfactory prices in Eastern markets although the demand has fallen off somewhat and sales show lower values in the last few days. Private sales show easier feeling on best grades and a slightly better feeling on lower grades. Shipments of oranges from Southern California total 654 cars for the week, as compared with 875 the week previous. Shipments of from 100 to 125 cars daily are expected for the next few weeks as there is considerable fruit that must be moved promptly. Trading on best stock is reported active on a f. o. b. basis of \$4.25 to \$4.75 per box.

The market on best stock lemons is

strong, the demand exceeding the supply. Poor stock showing decay, is going slowly at low prices. The weather remains favorable in the East for the sale of lemons, and indications show a continued active market for sound fruit. There are 650 cars of lemons in storage now as compared with 550 cars at the same date last season. F. o. b. quotations are on a basis of \$6 per box on best lemons. Indications show a crop of 10,000 car loads which will be the heaviest shipment in the history of the industry. Pickings are exceptionally light in all districts at present.

Total shipments of oranges for season from November 1, 29,634 cars; last year to date, 12,723. Total shipments of lemons to date, 8,494 cars, as compared with 4,715 cars last year to date.

a fact that the buyers were practically out of the market this week.

Apples \$23@23½c
Pears 20@21½c
Peaches 19@20c
Apricots 26@33c
Prunes 13@15c
Figs, Adriatic 14@20c
do, Calmyrna 16@23c

RICE.

A \$25,000,000 rice crop from Sacramento Valley is predicted this year. President J. H. Stephens of the Pacific Rice Growers' Association expects a yield of 4,500,000 sacks and says statistics covering every district on acreage and condition of crop are now compiled and that the yield will not be far from \$25,000,000.

HONEY.

There were no developments in the honey situation this week. The market is strong for honey for shipment, but locally there is practically no demand at present prices. Water-white orange blossom 18@20c
White to water-white sage (subject to production) 18@20c
Light Amber Mountain (Sage-Buck-wheat) 14@16c
Light Amber Alfalfa 12@14c

WOOL.

While this is the quiet season of the year in the wool-buying business, there is a strong undertone to the market, both in the East and on the coast. Stocks of wool are very low. Total amounts of wool used during June, 1919, by condition, in pounds, were: grease, 40,332,664; scoured, 6,064,243; pulled, 2,452,985.

Humboldt Nominal
Mendocino Nominal
Sacramento 47@52½c
San Joaquin 45@50c

HIDES.

The market for both packer and country hides is strong, and the tendency is still further upward. Supplies are not plentiful and are in strong demand.

Wet Salted:

Steer 37½@42½c
Kip 60@67½c
Cow 35@37½c
Calfskin 65@75c

Horse, Wet Salted:

ALFALFA MARKET.

The Alfalfa Growers of California, Incorporated.

porated, 525 Central Building, Los Angeles, furnish the following quotations on Alfalfa Hay, which are selling prices to purchasers of carload lots 1. o. b. Los Angeles.

The grower, to arrive at his selling prices, f. o. b. his station, should deduct the carload rate of freight from below quotations.

ALFALFA HAY.

No. 1 Dairy \$27.00@29.00
Standard Dairy \$25.00@26.00
Standard Alfalfa \$23.00@24.00
Stock Alfalfa \$17.00@20.00

HAY.

Choice alfalfa is in good demand but grain hay is still dull. Prices remain the same as quoted last week. Receipts good.

Barley hay, per ton \$18.50@21.50
Oat hay, per ton \$22.00@25.00
Alfalfa, Northern, per ton \$21.00@23.00
Alfalfa, local, per ton \$23.00@25.00
Straw, per ton 9.00@10.00

Special Livestock Market Report

San Francisco, Aug. 12, 1919.

CATTLE—There is a conservative feeling in the cattle market due to the high price of feeds and the government's action in offering foodstuffs to the public at cost. Cattle growers in common with producers generally, are in a state of uncertainty as to the future and are not forcing cattle on the market. The supply is therefore short, especially on the better grades of stock, and although there is no advance in quotations announced, the price trend is upward. Prices rule higher for calves.

Steers—
Grass steers, No. 1 weighing 1200@1400 lbs. 9½@10c
Grass Steers, thin. 6@7c
Grass Cows & Heifers, No. 1. 8@8½c
Grass Cows & Heifers No. 2. 6½@7½c
Grass Cows & Heifers, thin. 4@5½c
Bulls & Stags, good 4½@5½c
do, fair 4@4½c
do, thin 3@3½c
Calves, light weight 12½@13c
do, heavy 10@11c

SHEEP—Good mutton sheep are scarce, high wool prices figuring as a prominent factor in keeping supplies off the slaughter market. The recent sag in the Eastern market has been overcome by lighter receipts later on. The lamb market is active, and high prices prevail. Locally there is a slight decline this week in wethers and ewes.

Lambs, yearling 10@10½c
do, milk 13@13½c
Sheep, wethers 9½@9½c
do, ewes 7@7½c

HOGS—The hog market this week is very unsettled both here and in the East. The action of the Government in throwing large stores of bacon on the market much below market quotations the disturbances in the labor situation at packing plants and the railroad troubles all contribute to accentuate complications. We note this week a fractional recession in prices.

Fisk Cord Tires

An Investment in Tire Economy

ENDURANCE is the supreme test of tires—the thing that gives excess mileage and saves money.

Quality, experience and high manufacturing standards build into a tire things which insure long mileage—which rolls off the miles, thousand after thousand, without interruption and without inconvenience to the user.

Fisk Cord Tires are built just that way. Big, good looking, with extra tough tread, they give you easy riding, save gas and—most important of all—deliver the miles in excess of what you buy.

That saves you real money.

Next Time—BUY FISK

FISK CORD TIRES

(Made also in Ribbed Tread)

Purpose and Scope of the State Fair.

An Interview with Geo. C. Roeding, President of the State Board of Agriculture.

THE STATE FAIR, held annually in Sacramento under the auspices of the State Board of Agriculture, is now recognized as one of the institutions that has a very important bearing on the development of all the natural resources of the State. The growing interest now manifested by the agriculturalists and horticulturists, by the dairy and livestock men, and by the great institutions which manufacture, process and find markets for our products, is a proof of that.

What Is Its Purpose?

The main purpose of the State Fair today is to educate in matters pertaining to Horticulture, Agriculture, Dairying and Live Stock in all their branches; to demonstrate the best materials and cultural methods of obtaining given results in these industries; to show modern methods of marketing our wares and what the world's markets and our own markets demand.

Another purpose is to promote friendly rivalry by exhibits from various counties as well as to widen the knowledge of what those counties stand for.

Some 20 counties are making great central exhibits this year. All of these things help our producing industries in a measure that is hard to calculate. They help to disseminate information that can not be spread in any other way. Only by such a grand aggregation of products is it possible to compare results—to see, weigh and handle them.

An Instance in Point.

Suppose some one has a Tuscan Cling peach with a smaller pit and more meat. It is brought here, its origin and habitat noted, and its merits discussed. Prunes from the different sections are shown. Their size, shape and quality are compared, their habits and bearing capacity discussed together with one hundred and one things in connection with the industry. Such comparisons must result in advancing the industry by the application of lore picked up at the Fair. It is only by concentrating at one place and having the objects at hand that these things can be brought out.

The above are a few of the details presented in answer to our first question—"Purpose." We asked Mr. Roeding about the Future. He said:

Business Demands a Definite Plan.

"Let us pause for a moment and formulate in our minds what a State Fair should be. Having decided, we proceed to outline a definite plan to work on. For nothing is done that is not based on a system. In the first they must be built on model lines. At the same time they must be models of efficiency, thus providing examples for our country fairs. They must be built on model lines. At the same time they must be models of efficiency, thus providing examples for our county fairs. In the construction of a cow barn, dairy building, hog barn and the many other buildings, they must serve to educate those who see them and be of such a character and design that interested parties may obtain ideas from the examples set before them that they will be proud to follow."

"The only buildings which appeal to the directors as serving a purpose

today are the Women's Building, erected in 1916, and costing \$30,000, and the new Horticultural and Agricultural building, completed a few months ago at a cost of \$30,000—the nucleus of what promises to be a new era in the history of the State Fair. There is no other State building that will compare with this for exhibition purposes."

The First Attraction.

"Now the first thing that attracts us on entering the Exhibition Grounds is the buildings and their grouping or their setting. We admire their beauty and outward appearance, and are anxious to see the attractions which they house. Good buildings are necessary to provide a setting for exhibits and to induce exhibitors to come and spend the large sums necessary to show off their wares to advantage."

"We must therefore work for a concrete plan and build to it if our Exhibition Grounds are to present a homogenous grouping. To stick up a building with the idea of adding makeshift lean-tos is not good enough. Our producing industries for one State are already the greatest in the world, and this great fair will be "the" feature that represents them as a whole. Our fair grounds and buildings must be adequate in dignity and area to the vast rich State they represent. We want every exhibitor to be proud of the possession of his space and every grower or business man to be proud of attending an annual function and festivity he helped to create.

How Can We Enlarge Its Scope.

"The farmers, growers and business men must first remember that this is THEIR Fair. They must learn to extend their interest in the exhibitors themselves as well as in that which is shown. They must offer suggestions and ask for them, too. The Board of Directors can only do so much work as the annual appropriations will reach. That is their job. The members of the Board receive no pay—only their expenses. They work solely for the advancement of the producing industries in the State of California.

The time has arrived when the scope of the Fair should be widened and more buildings provided to meet our enormously increased

production. Californians must see that funds are available to carry this out. The annual appropriation of \$30,000 for premiums and funds for the maintenance of the buildings and grounds are the only moneys that the Board of Directors have at their disposal.

The plans are ready to complete a definitely formulated "entity" as fast as funds are provided to carry them out. Every citizen of the State of California is interested in the fulfillment of these plans—not only from the civic standpoint, but because it is good, profitable business.

All exhibitors are represented here by men who want you to ask questions—you need not buy, just ask questions and learn. These men are here to answer those questions, and they want you to do it. The State Fair is a business proposition that is also made as attractive and entertaining as possible. As San Francisco is the metropolis of the Pacific so must our State Fair become the Mecca of visiting investors.

GEORGE C. ROEDING,
President California State Board of Agriculture.
"The State Fair can be the greatest educative and promotive agency in California development, and it is the duty of every Californian to help realize its benefits."

EDITORIAL.

THE STATE FAIR.

WE ARE giving this issue largely to things culminating at the State Fair which will open at Sacramento on Saturday, August 30, and continue until the evening of Tuesday, September 9. It will be the biggest thing of the year in the industrial sky of California. It is primarily agricultural—as it ought to be, because our wonderfully varied agriculture is our greatest industry—but remember it is our State Fair and therefore the exposition of all the interests which make California great and deserving to be greater. We hammered on our skull a little in the effort to wake up an idea of what should appear on our first page this week as the exponent of California's most promising and potential line of production and we have a firm conviction that we have hit it off right. We thought of the mountains Whitney and Shasta which lift us highest into the blue canopy in both actual attainment and inspiration; we thought of the great waterfalls of our Sierra ranges which not only pour the beneficence of the sky upon our productive plains, but will be the source of living waters for our great cities during all coming generations; we thought of our record-breaking animals which are winning places for us in the livestock industries of the world; we thought of our beautiful trees and vines which constitute ours the world's greatest fruit-producing commonwealth—and then we thought some more! Whence come all these things to make us happy, prosperous and proud of our earthly inheritance? They came from God. And what is the greatest thing God ever made in the world; was it the glistening snowcap of a mountain, or the sheen and shimmer of a cataract; was it a lordly quadruped, with all its power to acquire and transmit traits of incalculable industrial value, or a tree "pleasant to the sight and good for food"? No; the greatest thing God ever made in the world is Man—to "have dominion over every living thing that moveth upon the earth"; Man "to multiply and replenish the earth," from the marriage in Eden to the League of Nations!

And so it came to pass that our frontispiece presents what is, beyond peradventure, the greatest thing in California—a Californian! He is a son of our soil, a product of our environment, a leader in our enterprises. He is charged with the California spirit and holds the California point of view as to what constitutes real greatness and the most promising approaches to it. California enters as her leading exhibit at the State Fair of 1919 the man who has inspired and helped all others to work together to ensure the success of it!

GREAT FORCE TO PUSH CALIFORNIA.

The coming State Fair is a great opportunity. Californians themselves are the great force and that is why we try to exalt the human factor in the exposition and urge its full representation in the affairs of it. Men and women should rally to its support and patronage. It will be by making our institutional agriculture strong and truly representative that our individual farming will become

more confident, efficient and prosperous. California has no second in her institutional agriculture, whether it be measured in educational, co-operative or other institutions or in all of them, and yet California is now only a marker of what California will be—but she is on the way. In speaking to an assembly of agricultural teachers at the University Farm the other day, Dean Hunt of the University of California is reported as saying: "Farmers are soon to occupy a position of importance that they have not held before. A new day for the farmer is coming, if it has not already arrived, and some of the keenest minds in the world are today being used in California for the production of food." This is a perfectly true statement; go to the State Fair and see the demonstration of it!

THE COMBAT THICKENS.

Since our last issue the movement against food prices and profiteers has proceeded from Washington, as then indicated, and has localized itself in all parts of the country. The matter, so far as agriculture is most directly concerned, still clings to the national capital and is most expressive in the line of governmental policies related to production as a whole. Insistence is becoming stiffer against all efforts at arbitrary regulation and price fixing, which were endured patriotically and patiently as war-measures but which are now held to be of questionable value even as such. On August 16 there was realized, under the leadership of the National Grange, the nearest approach to co-operative cordiality, among representatives of farmers' organizations at Washington, in making their purposes known to Congress. So far as these relate to direct operations of farmers, the following are noted:

Ending of wheat price regulation and all price fixing on primary food or clothing material at the end of the present crop season. Removal of all restrictions and regulations based on war powers of congress, including the food administration activities.

Immediate termination of the powers of the war trade board.

Removal of all internal revenue taxes on food products.

Immediate revision of discount and grading rules, especially on wheat, and adequate representation of actual producing farmers in the formation of grades and discounts to be adopted in the future.

Enactment of laws to define legality of collective bargaining among agricultural people.

Recognition of organizations of producing farmers in making up the personnel of committees, boards or commissions to direct enforcement of existing laws or proposed laws.

Most of these contentions seem to have been prompted by the experience of producers during the last two years. Whether greater hardship has been inflicted upon them by arbitrary policies of price-regulation or by the ways in which these policies have been administered, seems to be in doubt among the farmers. As both phases of the subject are obscure, the first being hidden in the mazes of economic science and the second carefully covered by secrecy in administrative methods, the farmers naturally desire escape from both things which they cannot understand. They only know that they have been very hard hit in the dark and they insist upon sunrise and blue sky for doing farming.

THE FARMER'S RELATION TO THINGS.

The contentions cited above are such as we have repeatedly emphasized and the simple suggestion of them is enough for this time. There is fortunately coming out in the Washington conferences quite clear assurance that the farmers are finding their voices and that they propose the general public shall more fully understand their relation to other groups of people whose encroachments are limiting the capacity and efficiency of this industry. Take for instance the declarations of J. R. Howard, president of the Iowa Farm Bureau Federation, who appeared on Saturday last before the Committee on Agriculture of the House of Representatives as spokesman for a conference of farmers from Iowa, Nebraska, Indiana, Ohio and Illinois. Denying that the farmers were responsible for present conditions, Mr. Howard said:

The high cost of living is not due to the lack of desire or effort on the part of the farmers to produce to the limit of their physical ability. The farmer has not struck, walked out, or otherwise slackened in production.

The high cost of living is due to a stagnation in production of manufactured goods and prepared food-stuffs. Every labor strike that shuts down any plant engaged in the preparation of foods or the making of clothing, that shuts down mine or mill, adds to the high cost of living. If capitalistic monopoly wants enough food produced that it may be regularly fed, if the do-nothing dawdlers want enough food produced so that they may occasionally eat, let them stand forth now and declare by deeds that they will co-operate with the farmers! Let them cut out profiteering in goods and wages, and go honestly to the business of preparing and purveying the necessities of life, going honestly to the job of doing a full day's work for a full day's pay.

Such declarations in the public ear at the national capital will rarely do something to awaken the public mind to the real causes of the troubles which we are now facing in this country.

WHERE IS THE HIGH COST OF LIVING?

In connection with the foregoing and emphasizing the truth of the contention of Mr. Howard as representative of the farmers of the middle west, is the result of a recent inquiry into the relative advance of the various necessities of life by the Secretary of Commerce and Labor made public in Washington on Saturday last. It was shown that there was a general increase of about 80 per cent in the cost of living during the period from December, 1914, to June, 1919, based on investigations in various representative cities over the country. In every instance greatest increases were recorded in the prices of clothing and house furnishings. Food advances were of third importance. Figures for the period December, 1917, to June, 1919, show general averages of about 20 per cent in the cost of food supplies.

It seems very clear that the higher cost of living is chargeable to manufacturing or to profiteering in manufactured materials. Though there have been greater increases in certain lines of food products, for 20 per cent is the general average, the surprise must be not that it is so great but that it is not greater and that the food producers have been able in spite of the way all other interests have encroached upon the farmer's will and ability to reduce his cost of production, he has been able to do so much to keep the consumers' expenditure for staple foods down to such a moderate increase. The fact is that the farmer has been up against it all along and that he will keep up against it just as long as he can, for he is built that way. It was however clearly told the Congressional committees by Charles A. Lyman, secretary of the National Board of Farm Organizations, that: "The effect of legislation which may reduce the price the farmer receives for his grain, livestock and dairy produce will be to decrease production. The farmer will simply quit producing except to support his family. We feel it our patriotic duty to fully advise Congress as to the effect of such laws." And the reason why the farmers may do as Mr. Lyman describes will not be because they will to do it but because they cannot do otherwise.

SENATORS MAKE DECLARATION.

It does not yet appear what effects will follow the coming together of farmers' representatives at Washington. They seemed to be strongly opposed to the government's policy of food regulation and administration, and they took the chance to object to the President's second veto of the proposed law to make the clock tell the right time after October next. They seem to have scored a hit in the Senate Committee on Agriculture, for the majority thereof, including both republicans and democrats, issued a signed statement which is rather a sharp arraignment of the way in which the fixed price is administered to the detriment of the wheat-grower. The statement is forcible and specific, thus:

The farmers' interests must be safeguarded. Hundreds of millions of bushels of wheat have been shriveled by heat this season, and under present grading rules cannot sell for more than \$1.50 a bushel. Millers, however, plan to gather up this grain and make it into high grade flour to sell at prices based on No. 1 wheat. At this time we shall insist on a change in the wheat standards so as not to penalize every grower of wheat. The producers are defrauded and the consumers receive no benefit.

We do not know enough about milling to decide whether the millers can make high grade flour from heat-struck wheat or not, nor what it means.

cost to do it, but they can be trusted to make their own points if they desire. The chief significance to us at the moment is that the farmers are being heard and heeded at Washington and that both political parties are sitting up and taking notice! Farmers must keep sowing the seed of such doctrine. In due time they will reap if they faint not. They may even get to be thought to be politically as much worth while as federated labor!

WHO OWNS THE FARM SKY?

But we ought, perhaps, to rise above the politics and profiteering which we have suggested and here seems to be a chance to get up! The question is: Granted that the farmer is being batted about on the surface of the earth, has he a chance to get his own in the sky? We have read that Frederick Hoenemann, a farmer living near Kansas City, has obtained a temporary injunction forbidding aviators to fly in the air over his farm. He has been much annoyed by the planes. They scare the horses, and one of them dodging the shadow of a plane, jumped into a ditch and broke its leg. The throbbing of the engines disturbs the animals so that they will not leave the barn when there is a plane overhead. The plaintiff's attorney contended, on the basis of common law, that the owner of land owns everything beneath it to the center of the earth, and everything above it to the zenith. Thus any aviator cruising overhead, no matter how high, is literally trespassing on his atmosphere, and can be ordered out of it just as a pedestrian can be ordered out of a field. The local judge has therefore issued a temporary injunction against planing over Mr. Hoenemann's farm and the constable is wondering how he can get the trespassers! We remember that the same question came up in France just before the war broke out but since then the planes have been sailing as war measures. It looks very much as though a new law question had appeared under the sun. It is possible that it may be necessary to give the land owners only a league of air, just as nations have only a league of ocean, for their very own, and to have height cops hiding behind the clouds just as we have speed cops behind the bushes along limited highways. It promises to be a very interesting matter.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Pigs and Green Fruit.

To the Editor: How much is gained by feeding green plums, peaches, etc., to pigs and hogs? It seems to be an established fact that for people the acid of green fruit is very undesirable. Is it like the case of the man who bought a pig and kept it a year and sold it for what it cost him, but claimed that he had the satisfaction of having the pig for company and to eat swill for him?—G. L., Auburn.

Yes, it is very much that way. Green fruit, except perhaps in very limited way as a tonic in connection with other foods, is of no advantage to a pig. He may not squeal about it as much as a small boy is known to do, but he probably feels that way. Of course, as fruit approaches ripeness, it becomes better for both of them.

Flat-Headed Borer in Walnut.

To the Editor: I am enclosing some kind of borer that has killed and damaged some of my walnut trees that I set out last spring. What I have caught so far seems to start boring above the ground about a foot, and they seem to start at a bud and work up the stalk of the tree until the top dies. It works under the skin and cuts a bigger channel the further it goes.—H. B., Modesto.

It is the common flat-headed borer which infests early all kinds of fruit trees—generally after the bark has been injured by sunburn. Open any dark spot you see on the bark, and if you find a burrow, either push a piece of pliable wire to the end of it, or cut along until you get the worm. Keep your trees whitewashed and you will have little trouble from this worm.

Horse Beans.

To the Editor: Are horse beans suitable for hog feed, and when should they be planted on dry as well as on irrigated land?—D. G., Redlands.

Dry beans are suitable for hog feeding to the same extent as other beans are. They should be sown with corn or sorghum grains because they are

over-rich in protein. Green horse beans are nutritious forage. Horse beans are hardy against ordinary frosts and are therefore adapted to winter-growing and to use rainfall. They can, in fact, be planted whenever the soil has moisture enough to keep them growing—either from rainfall or irrigation.

Peach on Almond.

To the Editor: I intend planting peaches this fall and find it almost impossible to get the amount of young trees I desire on the peach root, but can get them on the almond root. I know nothing about the almond root, but am told that while it makes a larger tree it is more subject to root-knot, so would appreciate what you will give me on the subject.—Subscriber, Mountain View.

We should take the almond root if we were sure the soil to be planted is not likely to be waterlogged. That does not mean merely that it is on a slope, because slopes water-log if the soil is too heavy and shallow. As for the root-knots the almond is somewhat more subject to them, but that need not be an objection if you are sure not to accept any trees which show them or signs of their having been neatly whittled off. Get clean almond roots and then watch for the development of them while the tree is young and you need not apprehend trouble afterwards.

Will Cucurbits Mix?

To the Editor: It is the general belief that melons, cucumbers, squashes, etc., will mix if grown close together, but I have never found any one who will say how it is done and how to avoid it. Please enlighten us on the subject.—G. L., Auburn.

So far as we know you have gone about as far as Darwin did for in one of his books, he says: "In the United States, where the cucurbitaceae are largely cultivated, it is the popular belief that the fruit is directly affected by foreign pollen, and I have received a similar statement with respect to the cucumber in England." That is that the growing squash, melon, cucumber, etc., is itself liable to be changed as the effect of cross-pollination—not that the potentiality of the seed it will bear will be changed. If we remember correctly, Mr. Burbank has had many observations to prove that the growing receptacle of the seed may be changed as well as its contents. We have no idea that Darwin or Burbank, or any other man can tell how it is done. To avoid it is easier, viz.: to lessen the chance of it by keeping the plants as far apart as possible. Why it is likely to be done is due to the fact that all the plants named have a mechanical structure of the blossom which makes it easier to take pollen from an intruding insect than from its own supply—therefore it may be said to be waiting for intrusion and the intruder is likely to blow in from some other plant.

Dancing Galls of the Oak.

To the Editor: I am sending some seeds which I found under an oak tree in front of a reformed road house, where they sell soft drinks, nothing stronger than 2.75 per cent beer. When I saw the seed jumping around I rubbed my eyes and wondered if I was seeing things. The ground was covered with them and the earth seemed to be in motion. Are they "jag" seed or shades of departed sprees? What are they? Do they really jump or are my eyes wrong?—E. L., Ceres.

Our correspondent sends roundish, seed-like bodies about as large as a turnip seed which really do jump about as he seems to see them and when they are abundant as he found them the whole surface of the earth seems to be restless. It does not require 2% per cent beer to see them; they will be just as clear with ½ per cent beer, which promises to be all that Congress will allow us to have. But they are not seeds at all—they are the dried galls or swellings which a very minute hymenopter or four-winged fly caused to grow on the surface of an oak leaf by stinging the tissue. In the swelling thus formed the fly's egg grows into a tiny grub and when the leaf dries as the summer advances the gall detaches itself and with the grub still enclosed falls to the ground. That is what you find and when the grub decides to flop and stretch inside he makes his house jump or dance around, and that is the reason why his proper name is cynips quercus-soltatrix—the dancing gall-fly of the oak.

In connection with this, one always thinks of the Mexican jumping bean. In that case however the body is really a seed, which has a grub inside—not a real bean but a bean-like seed—which is

MORE MONEY FOR YOU

Are you looking for a better position? If so, be sure to investigate the work in our circulation department. If you like to travel and interview people you will enjoy it, and the remuneration will satisfy you fully. Lack of experience is no barrier. We give you proper training and bang-up support. No investment necessary, but you must have an automobile. Write us about your qualifications and experience, and let us tell you about this opportunity for ambitious, energetic men. It will interest you.

made to dance and jump as the grub takes his exercise therein.

Too Much Water or Too Much Pruning?

To the Editor: I have some peach and plum trees in my back yard (which is also used for a vegetable garden) that put out an immense growth of new wood every year. Some of the new wood is 10 feet long (one year's growth). The trees blossom very little and bear less. They are six years old and have been pruned back short every year, and they grow until late in the fall, with green leaves on some of them at Christmas. I have blamed the fault to too much irrigation. There are 12 varieties—apricots, plums and peaches, all act the same way. Will pruning them early in September bring any more fruit, or what can I do to get more fruit.—T. B. E., Oakland.

Probably your trees are over-irrigated as you suggest, but if they had not been so over-pruned and thus forced to excessive wood growth they might perhaps have made better use of the water by turning it into large fruit. It is possible, with growth now so rank and likely to continue as late as you mention, a good repressing effect might be exerted by pruning now—but for such effect it is usually necessary to curtail the foliage earlier in the summer. Try pruning a tree of each kind now—not cutting back any branch or shoot, but wholly removing all suckers or rank new growth, starting from the largest branches and thinning out the branches by removing those which interfere with others or parallel them too closely. Do not cut back any small shoots, but remove some if they crowd very closely. Allow most of the trees to go unpruned, both now and next winter. If they set too much fruit next spring, as may be the case, thin out the fruit and remove the excess branches also at that time.

Rather Hard Row for Cherry Trees.

To the Editor: Last spring I took out 200 gum trees and this coming season want to plant cherry trees in the space. It is on a side hill, southwest exposure, and gets a good bit of wind. Do you think they would do all right? Also, do you think it a good plan to dynamite the holes early this fall to let them stand open until planting time; I didn't know if it would wash too much. The hill is fairly steep, but the ground is pretty well packed as it has never been cultivated.—T. W., Sebastopol.

You can get good cherries on Sonoma hillsides if the soil is deep enough and fine enough to hold moisture to finish the summer's growth. If the soil is hard and shallow, you run the chance of losing the trees in winter by soursap and in the fall by drying out. If you do not use too large charges of dynamite and put them three or four feet deep, you ought to make the soil take and hold water better and not increase the danger of washing. Do not use enough to blow holes, unless you have stumps to get out. But we should seriously doubt the wisdom of putting a fresh gum tree clearing into fruit trees. It should be manured well and farmed for grain or hay to get the soil aerated and mellowed, and we would particularly doubt suitability to cherries in such a piece as you describe. Study the case a little before deciding and look over the district and see if you can find good cherry trees on such soil and such situation as you have. Cherry trees are rather finicky and have to be humored a good deal to be profitable—unless you wish to grow pie or sour cherries. They will stand much hardship.

California Weather Record.

The following rainfall and temperature record is furnished Agriculture Weather Bureau at San Francisco for the week the Pacific Rural Press by the United States Department of ending August 19, 1919.

Stations—	Past Week	Rainfall		Temperature	
		Seasonal To Date	Normal To Date	Highest	Lowest

Horticulture and the State Fair.

Written for Pacific Rural Press by John J. Fox.

Why do we go to the State Fair? What is it going to do for us this year?

What do we get out of it? We go every year for a very feminine reason—"Because." This means simply that there are various reasons of which we are very conscious, but we have never bothered to outline or embody them in definite thoughts. There is no necessity to, because we are going anyway.

Some of us are going to view our own exhibits or make definite purchases, and have to be on hand. But the majority of us go primarily to be instructed and entertained. Instruction and entertainment are running mates: it is necessary to be interested to gather profit from either. Some of us want to see the trotting stock or the best pure-blood of any domestic animal or bird in the State. Here it is.

Others are stirred by watching some practised individual pawing the air and ramping about nothing in particular so long as he gives vent to plenty of "fury and sound." Here he is, in front of every side show. We really like him because he is so human, yet wonder how he learned to get that way.

The foregoing is by way of straightening out the bewilderment so many of us feel at first contact with the multitude of holiday-makers—just as we get inside the gate.

This year the State Fair is going to do more for the fruit grower than ever before. Because the fruit grower has suddenly leaped up into the lead, and because this year he has a good solid bank-roll. When the farmer of fruit grower has a surplus, the first thing he thinks about is improvements—new tools, a new tractor, new pumping machinery—anything to simplify work, improve results, increase production, and lower the labor bill. All the "improvements," having remotely anything to do with the orchard or its product are here.

Let's Look at the Fruit.

Here are the various packs of apples put up to comply with the new laws. The advantages of standardization are demonstrated. For apples

compete in the world's markets and competitors are making their standardization laws very strict so as to capture the trade on merit. The demand for ours is in competition with Canada and Australia as well as our own States. There are 53 varieties displayed here—a full pack.

There are also "quantity" exhibits, consisting of ten boxes to the exhibit.

Demonstration of Extent.

These "quantity" exhibits of ten boxes each are also a feature in the competitive displays of pears, peaches, plums, apricots and grapes, and are grouped to show the volume and value of the fruit industry in the State.

There are 34 varieties of pears and 50 varieties of peaches, and each variety of all the "commercials" provides a premium for both single standard packs and quantity exhibits.

All have to be labelled correctly, and everyone can compete—counties, growers, packers, or shippers.

Here are standard packs of oranges, lemons, pines and pomelos, semi-tropical fruit and berries in standard packages and a gold medal offered for olives.

The best commercial varieties of walnuts and almonds are shown processed and put up for the marketing. Chestnuts, pecans, hazelnuts and even the humble "goober pea" are in this exhibit. The special attendant in this department carries a nutcracker and is decorated with a star you will notice.

Dried Fruit Featured.

The large displays of dried fruits this year and the premiums offered were compelled by the vastness of the industry and what it means to California. It is a new feature. It attracts as much attention as a piece of specimen rock from high-grade ore would among a bunch of prospectors. The exhibit here is, so far as space allows, commensurate with the magnitude of the various dried fruit industries.

Not only are standard packed boxes of cured fruits of all kinds shown, but premiums are given for the best individual exhibit. And here are large assortments of retail packages that

go direct to the consumer. You learn where they go and perhaps why the public wants just that kind of package.

Educational Exhibits.

Here is an educational exhibit showing the curing and packing of peaches. You can see how they are served—taste this peeled peach out of the carton. Now you know why it is no trouble to sell them. The fuzz is gone and the process has been perfected. They taste better than when you pick them off the tree—same as a date. The Fair Management hung up a \$100 premium to induce worthy exhibits for public education, as well as diplomas for factory exhibits of merchandised fruit.

Here we have magnificent exhibits of canned and preserved fruits and jellies, sauces and pickles by packers and canners who have been competing for the various gold medals to proclaim the excellence of their packs. Through these exhibits we can learn to some extent the enormous world demand for our canned fruit that has been so promptly met by our men of the business-world.

Ever since last fall they have been building new canneries, extending old ones, and going after business. These new home markets have "lapped up" our record crop before we knew it and have aided in our golden harvest—incidentally gleaning a bit for themselves by the way.

From Orchard to Home.

You may learn through these exhibits how your fruit goes from the lug box to the home. What it looks like when it is merchandised in various ways, who buys it and how they serve it. You will perceive why so many of our good housewives are going out of the canning business entirely and buying the stuff. They can't compete with the canneries. Glass costs too much, sugar is high and the canneries buy the best quality of fruit and put it in tins. If your good wife wants to move into a new flat it is easier to move tin than glass. Consequently, a large home trade has grown up among our American housewives for factory-canned stuff, who

formerly put up all their own fruit. What Shall I Plant?

Here is a big competitive display of nursery stock, flowers, ornamental trees, and shrubbery, bulbs and seeds, with gold medals hung up for the most meritorious display. You have learned already the many uses to which our fruits are put—the many different ways of preparing them for the table, the new markets and demands made by pushing our trade. Now you will ask yourself, "What shall I plant that will be in best demand seven years from now and that will secure the best returns?" "Where shall I go for my trees?" You will learn the economic value of bees apart from their productive value. You can see them at work from a safe point of vantage.

Wine Eliminated.

For the first time the displays of our one-time great wine industry have been eliminated. The products of the wine vineyards are still displayed, however, in the shape of grape-juice, grape syrup, vinegar and all kinds of non-alcoholic drinks.

This is a particularly interesting department to visit because of its demonstration that wine grapes can still be profitably grown in quantity, for the legal manufacture of beverages. A number of wine men and grape growers will foregather here every day, and much is learned in these discussions. A good "guessing match" is easy to find these days. The present high prices have given rise to a general feeling of elation among growers not unmixed with apprehension.

Among the men you meet are men who are enjoying the sun while it shines. This happy bunch is in the majority. There are those, however, who are vaguely uneasy about prices in general, and a number are frankly distressed when the cost of labor, transport and commodities are considered.

With all the food for reflection to be seen and heard at the great State Fair, one feels like the old sailor's parrot, which, the owner explained, "couldn't exactly talk, but he was a regular devil to think."

How Our Peaches are Processed.

Written for Pacific Rural Press by D. J. Whitney.

Things are different in the dried peach business since the Peach Growers' Association took hold of things, and since "practically peeled" peaches came on the market. This outlines the operations of the fine packing house built by the Association at Selma.

When the trucks or wagons of the grower-member come to the door the peaches are unloaded, weighed and hoisted by an elevator into a grader, one of these standing at each side of the doorway.

Passing through the grader, first the dirt and litter is shaken off, the standards fall through the next screen, the choice through the next, then the fancy, and last the extra fancy peaches. Peaches of these two large sizes fall upon belts before they reach the weighing trucks, and all slabs, discolored, or otherwise unsatisfactory peaches are removed by the girls. To secure a thorough job of grading, these two large sizes are run through the grader a second time. Each grower's fruit is kept separate all this time and is weighed by grades as it finally leaves the grader and every man is given credit according to the size of his marketable fruit. When the fruit goes from the scales to the bins it loses its identity and is mixed with other fruits. Muirs and Lovells are graded separately; the less important and inferior drying varieties are stored and shipped together.

From the immense bins the peaches

are delivered by a traveling conveyor to the processing department, almost the whole output of the largest houses being practically peeled. This process was devised by H. A. Beekhuis, manufacturing manager for the Association, and was sold by him to the Association for a moderate sum. Measured by its worth to the growers and to the company, a million dollars would be a small estimate of its value. It has been of the utmost worth in developing new markets and increasing the selling price of the processed fruit.

The peaches now go into a solution of soda in boiling water, which loosens the skins and incidentally removes any dirt on them. Then they go through cold water, which removes the soda, and into the peeler. Rotating brushes force the peaches along wire cylinders, which scrapes off the skin. Muirs peel best. Lovell skins stick much tighter, but a great deal of it is removed and under all circumstances the fuzz is all taken off, which is a great thing, and it only remains to dry, resulphur and pack the fruit.

There are 30 sulphuring houses, holding altogether 65 tons of fruit, the daily packing capacity of the plant. The fruit is held in the houses over night. Before being packed girls pick out all poor fruit.

Although most fruit is shipped in boxes, a carton trade started last season, is rapidly developing and twice last year's output will be sold this

year. These cartons contain 11 ounces, two pounds and five pounds of fruit. They provide an extremely convenient, simple and clean way of supplying family trade, and indicate one of the ways that co-operative marketing benefits both producer and consumer.

A new thing for the San Joaquin valley in the dried fruit line is dried whole clings. This proposition developed in the northern part of the State and was tried in the Fresno district only on a small scale last season. This year quite a few cling producers are going to try it on a larger scale. Only the small clings that the canneries will not take are handled in this way. Two slits are made around the peach, quartering it, but not removing it from the pit, and it is then sulphured and dried. These slits allow the moisture to escape. Whether clings are pitted or dried whole, a man with fruit that cannot be canned, cannot allow his fruit to spoil or even to go for hog feed while prices for fruit are so high, even if the cutting wages are high also and peach made pork higher than pork has ever been before.

Peaches Larger When Irrigated.

Lack of irrigation supplies and hot weather has reduced the prospective dried peach output of the San Joaquin valley 5,000 tons in the last half of July, according to Sales Manager Sturtevant of the California Peach Growers' Company. There are more

peaches on the trees than there ever have been, and the loss will come in reduced size. Naturally, growers with good pumping plants did not suffer at all and are in luck.

The crop has been so well sold that no more orders will be booked until it is certain that the fruit will be available, and Sturtevant says he could sell twice as many if he had them—thanks to co-operative marketing. Several years ago, when peach men sold through middlemen, no peaches were shipped to Europe. Now Europe is buying heavily and will do so every year.

The peeling process controlled by the company is responsible for much of the increased demand for peaches and more are going that way every year. This season approximately 60% of the crop will be sold in that condition.

John J. Gerdes of Terra Bella sold ten tons of Royal apricots from one and a quarter acres of six-year-old trees. The price paid was \$55 a ton at Porterville Cannery. At this price the fruit brought \$450 an acre. Tilton's are \$60 a ton at the same cannery.

The Oliver Chilled Plow Works has undertaken to handle the Thomas Crown mowers and rakes and Thomas grain drills in California since Baker & Hamilton have relinquished these along with their other lines of farm implements.

City Has No Charms for Tractor Farmer

Written for Pacific Rural Press by R. E. Hodges.

When Frank Critchett went to farming last fall at a time which seemed to be our country's greatest need, it was 25 years since he had done any farming, and at least 100 years since he had handled a tractor. But he had farmed in Vermont and Colorado and California before his quarter century of city business be-

gan. He had learned about as much as the ordinary man does about quadrupeds. With this knowledge, he took a trip last summer looking into the farming methods of the Pacific Coast States. His observations convinced him that the folks who were making the most out of farming were doing it with fire and steel rather than with blood and muscle.

Operated with Practically No Troubles.

He plowed and seeded about 400 acres of grain with that tractor, driv-

way at certain hours of any day, there was some of Mrs. Critchett's good cooking to entice them in. Then Mr. Critchett pumped them about the tractor.

Tractor Permits Double Cropping.

The traveler through Mr. Critchett's neighborhood sees only grain stubble or summer fallow at this season of the year, with semi-occasional alfalfa fields started since water became available a year ago. Mr. Critchett's 110 acres of bean fields are rather lonely in that part of the coun-

cret of good bean growing. But it couldn't have been done without the tractor, and wasn't done by other people here.

Not a Hoof on the Place Next Year.

But bean planting for horse or mule cultivation has to be in rows 32 inches apart, and even then the best-trained animals hoof down too many of the plants. A specialist in bean planting and cultivation was hired for these operations at \$1 per hour for the man, two mules, and the implement. This land is good enough to grow beans in rows 26 inches apart, and there is plenty of irrigation for the purpose.

"Not a hoof will I have on the place next year," says Mr. Critchett. "I will have a motor cultivator with various implements to use on it, and will take care of a bigger bean crop with less help. I probably won't grow much grain next year; but if I do, I will hitch the motor cultivator to a binder to harvest it. This winter I will have 80 acres of peas and probably a great deal more. These will be planted in November by motor power, checked for irrigation, and mowed at the proper time to make dried peas, for which there is a ready market. Pea straw makes first rate forage for livestock, including milk cows. The peas will enrich the land and will be off in time for beans to follow them."

The big tractor will prepare the seedbed in fine shape and on time. The motor cultivator will do all the lighter jobs and the automobile will do all the road work except hauling crops to town.

Some Pointers from Experience.

A man who is alert enough to plow (Continued on page 237.)

This big, simple, willing tractor enabled F. C. Critchett to put in 400 acres of grain last fall, though he had never used a tractor before. It plowed 200 acres during the heat of this summer without having sparkplug removed. Mr. Critchett expects to sell off all of his horses and farm with this 18-36 tractor and a motor cultivator, growing a great acreage of beans and peas.

gan. He had learned about as much as the ordinary man does about quadrupeds. With this knowledge, he took a trip last summer looking into the farming methods of the Pacific Coast States. His observations convinced him that the folks who were making the most out of farming were doing it with fire and steel rather than with blood and muscle.

Fortunately Ignorant.

But his ignorance of tractors was fortunately so vast that he was aware of it. That means that he was willing to learn. There are some folks who already have all the knowledge that is required to make them happy.

Mr. Critchett bought an 18-36 tractor from a firm which kept service men available. He was willing to learn all that they could teach him. He found them to be gentlemen and treated them as such. They soon learned that if they were passing that

ing it himself, and had only one or two minor delays. He pulled a dozen eight-inch Stockton plows—what he considers a good load for twenty 1300-pound horses. He used horses on an ordinary wagon broadcaster, and followed them with the tractor, pulling 60 feet width of extra-heavy wooden harrows spiked with nine teeth per bar and with fifteen-inch teeth following the wheels. No wheel tracks were visible when the job was done, and Mr. Critchett's stand of grain equalled the best in the country around.

The grain ripened unevenly, so it was harvested with a binder this summer while the tractor plowed 200 acres at the rate of sixteen acres every ten hours. The sparkplugs were never taken out, for they did not get dirty. The machine used 26 gallons of distillate every ten hours and three gallons of oil every 40 hours.

try, but they are making a good crop while surrounding fields bake in the sun. The soil is adobe loam. It was plowed dry after the grain was harvested, then irrigated and plowed again. The more you plow this soil the finer it crumbles, and that is a se-

BEEMAN (\$315.00) TRACTOR

During the past five years, thousands of dollars have been spent to perfect the Beeman tractor. The best engineering experts have been employed. As a result, it is a thoroughly practical machine—not an experiment to be tried out at the farmer's expense.

Hundreds of them are in use in California.

It does the work of one horse, with less expense.

It will plow, harrow and cultivate. Hauling a 3½ ft. mower.

It will run power machinery or do hauling.

The Demand for a Better Pea and Bean Thresher has Been Met by the WADE

Old style threshers are not equal to the task of cleaning Western brown peas and beans, with their tough vines and luxuriant growth.

New Wade Features

A stronger Blower of new design and larger capacity with an improved Damper that controls the draft; a larger cleaning surface with the air currents concentrated instead of blowing broadcast through the machine; briefly describe the jam or improvements in the new WADE.

WADE Thoroughness Throughout

A Thresher that will stand up under abuse, built a lot better than seems necessary, and finished to the last detail, with a sacking attachment and capacity that is unusual, makes the WADE complete.

Write for Full Details

Booklets fully describing this wonderful machine, with illustrations showing its new features as compared with the old method and prices that are no higher than on the ordinary machine, will be gladly mailed without obligation. Write today.

New Grape Syrup Manufacture

(Written for Pacific Rural Press by E. W. Cruess and G. W. Christie.)

The manufacture of a dark amber colored syrup for table use is described in Bulletin No. 303 of the University of California Agricultural Experiment Station. Since the publication of this bulletin we have made very great progress in our grape syrup investigations and have been able to produce repeatedly a syrup which we and many others as well consider far superior to grape syrups previously described.

The new syrup is deep red in color and possesses a rich jelly-like flavor. It makes an excellent table syrup, is suitable, when diluted with water, for fruit punches; diluted with carbonated water, it is a very pleasing beverage and may be used successfully for sherbets and other frozen dishes. In addition to the uses just mentioned it is suitable for export to Japan, South America, Mexico or other foreign countries for use in wine making, one gallon of syrup being the equivalent of about 3.05 gallons of fresh juice.

This syrup may be manufactured in large wineries, canneries, or other establishments suited to the handling of fruit. In addition to the crusher, press, tanks, and filter already on hand in wineries, a vacuum pan and steam plant are necessary. The manufacture of a vacuum pan requires about forty days' time; therefore anyone desiring to undertake the manufacture of syrup during the coming season must act at once.

To concentrate 5000 gallons of juice to syrup per 24 hours will require, according to an estimate made by one manufacturer a vacuum at \$2250, a pump at \$500, and a 30 H. P. boiler at \$1200, and a continuous pasteurizer at \$750. The cost of installation must be added to this and would probably bring the total to about \$5,000. Such an equipment would produce about 1400 gallons of syrup per 24 hours or concentrate the juice from about 30 tons of grapes.

The cost of manufacture from an estimate based upon the cost of manufacturing other syrups would probably be about 15c. per gallon of syrup to which would be added cost of container at 15 to 25c. per gallon, depending upon whether barrels, cans or glass bottles are used as final containers. One ton of grapes will yield

45 to 50 gallons of syrup. With grapes at \$30 per ton the cost of raw material bottles are used as final containers. would be 60c. to 65c. per gallon of syrup. Or the total cost per gallon for the finished syrup in the final market package would be from 90c. to \$1.05 per gallon.

Process of Manufacture.

The process followed in our experiments was as follows:

Use thoroughly ripe red wine grapes. To these may be added 25 per cent white wine grapes if desired. Crush and drain off free run juice and press the crushed grapes lightly. Transfer the pressed grapes to clean vats.

Heat the juice to 150 degrees F. and return it to the skins in a clean vat. Stir well to mix hot juice and skins. Allow to stand about 8 hours. This is to extract the color and to produce a deep red juice. Then press. It will be found that the hot juice has destroyed the sliminess of the skins and that pressing proceeds very easily.

Heat the juice to 150 degrees F. and allow to stand in a clean tank, 24 hours to settle. This is to clear the juice. Draw off settled juice from sediment and filter. Filter sediment separately. Now transfer to a vacuum pan and concentrate to 70 per cent Balling (70 per cent sugar) under a vacuum of 26 inches (or higher.) Each run must not exceed one and one-half hours because long heating destroys the color and flavor.

Store the syrup in clean tanks for six weeks to two months, to permit cream of tartar to separate. This may be recovered later. Draw off settled syrup into cans, bottles, or barrels, filling the containers completely full. Seal and ship. A bulk syrup for export may be made by running the syrup directly from the vacuum pan into barrels.

The use of the vacuum pan will be the only part of the process that is new to the wine maker. Vacuum pans or vacuum stills are usually rather complicated in construction, but they are installed by the manufacturer who also demonstrates the method of operation. Tin-lined copper pans or glass lined steel are best. Plain copper may be used but does not produce a syrup of as good color or flavor as glass or tin lined outfits.

WALNUTS ON CHAPARRAL LAND.

Mr. W. E. Reichart and Dr. N. B. Glasgow of Lower Lake are the first men in Lake County to plant walnuts upon the chemise and manzanita covered mountain sides of that region. For many years this red mountain land has grown a luxuriant crop of brush. It has been passed up by the old settlers as being unproductive of anything save woodticks. These men made their main plantings about five years ago, about 60 acres, and today these trees appear to be seven year olds judged by valley standards. The trees lie on a steep northern slope and the soil is a deep rocky loam. They are irrigated by wells high above the orchard and no pumping is necessary. This single experiment has raised land values on thousands of acres of similar land surrounding Lower Lake, which now are too thickly covered for good range. The local cattleman as a result is thinking more favorably of horticulture as the big money maker for his land, which up till now has been nearly useless to him.

THE RESULTS OF HIGH PRICES?

We learn from Consular Reports that Spain shows an increase in the area devoted to raisin grapes owing to the demand, at high prices, for dried Muscats during the past three years. In addition to the increased acreage, the Spanish growers are practicing irrigation where artificial water supply was never used before. They are also paying far more attention to food cultural methods. There's money in it.

Armenians even from this country, are said to be flocking to Mesopotamia

the garden spot of the world for centuries—now that the British are reviving old irrigation systems and developing new ones. The best conditions there are similar to the best conditions in the San Joaquin Valley. They can grow figs and raisins to compete with us. If Syria comes under Greek influence they will not forget to exploit her resources. The Levantine Greeks always have an eye to the main chance and are the most astute people in the world. 'Astute' is a good charitable word.

VITICULTURE NEWS DIRECT FROM FRANCE.

Professor L. O. Bonnet, Viticulturist, who served for four years in France with the French and American armies, returned to this country the end of July and has resumed his duties with the University of California. He says that the French are rehabilitating their vineyards as rapidly as possible, though it will be several years before the same area is at its best as existed before the war. A great deal of damage was done by a devastating frost last March on the plains of Gard, Herault and the Aude Department, much nursery stock being destroyed and the damage extending to the two-year-old wood on old vines. He noticed whole vineyards with shoots of from 8 to 10 inches long, where the whole area looked as if a fire had swept it when the frost took place. Above Lyons there was no spring frost and the crop outlook is good.

Mr. Bonnet says that there is a tendency just now in France to increase vineyard planting on account of the high prices obtainable for grapes and wine.

LOOK FOR THIS SIGN

Monarch Tractors

Find Out the Truth for Yourself

For your own interests, before you place an order for any other make of tractor, assure yourself that your conclusions are correct about the Monarch by putting your questions to us face to face and examining the **NEW MONARCH**. We will put you in touch with men who are using this wonderful tractor. Men that have looked twice before buying.

The time has come when every farmer and power user must own a tractor. The cost of production is the grand regulator of farm produce prices as well as other things. If you can't produce as cheap as the other fellow, you will lose out, even though you may toil from the break of day until late at night, while the other fellow has his hours of pleasure and seems to take life easy with his iron horses.

And it must not be necessary to ask yourself,—Can I get across to that field over to where I want to work, or can I work the field when I get there? Small farm or large farm, efficiency and service demand a track-laying machine—one that will work rain or shine, any day in the year on loose plowed and cultivated ground or elsewhere.

Finally, it must be reasonable in first cost and low in upkeep cost. Call at our exhibit and get authentic upkeep costs.

Wheat (12-24) Tractor

"World's Standard"

"Blazing the Trail" from Coast to Coast

proving to you—The Wheat Tractor is built to stand the "gaff." Sturdily made—carefully tested and inspected, every Wheat Tractor that leaves the plant, comes to you, is as good, part for part, as this Coast-to-Coast tractor.

First "transcontinental" trip ever made by any tractor—a WHEAT 12-24, drawing a trailer, equipped with bunks for sleeping purposes for three men, the land wheels of the tractor, and an Oliver-14 inch, 3 bottom plow. And the trip—"something unheard of in the tractor industry"—for—

From New York City to Los Angeles

climbing the mountains of Pennsylvania, crossing the Ohio-Illinois-Indiana Plains, standing the "gaff" of day-after-day heat in the Corn Belt. Entering the National Demonstration at Wichita, Kan. And—then on its way—crossing the Rockies, hauling its load through the Utah and Arizona deserts—on to Los Angeles, the final destination—some grind.

This same WHEAT Tractor will be entered in the annual tractor demonstration at Los Angeles, Sept. 16th to 21st. See this tractor—investigate what the WHEAT has done—then you will know what it can do for you. The WHEAT—a practical tractor for practical farmers—and a tractor most farmers will want to own. Write for our new book today. A postcard will do—then watch for the WHEAT—"we're on our way."

Careful Sulphuring of Peaches Important

(Written for the Pacific Rural Press.)

More peaches are likely to be spoiled this season in sulphuring than usual in the Fresno district, according to one of the leading growers of Selma, on account of the lack of moisture in those orchards where there are no pumping plants. The peaches will run smaller and drier and unless moisture is added just before they are put into the sulphur house they are not likely to get a good treatment.

Some peach men advise sprinkling water over the cut surfaces of nearly all peaches before sulphuring, but one of the best men in the business never adds moisture unless the peaches have stood too long before going into the house. The fault is not with the natural dryness of the flesh, but with the exposed surface. If that is newly cut, the sulphur will take; if it is dried enough to form kind of a crust, it will not take and will have to be moistened; and this is the rule he works by.

This grower considers sulphuring so important that he always attends to it himself, for it is too hard to get a man with sufficient interest to care for all details. The only load of peaches he ever lost was when a hired man did the work, and that was because too little sulphur was used. When this

orchardist opened the house after a proper period, he found that all the sulphur had been burned a considerable time before and brown spots had begun to form. He tried re-sulphuring, but nothing could be done. When a peach starts to go bad in that particular nothing can stop it. The amount of sulphur he uses per load depends upon the number of peaches used; 20 trays will take approximately one-fifth less sulphur than 25 trays. A good job of sulphuring is shown when the juice gathers well in the pit cup. Few hired men will pay attention to little details like that. Their lack of interest is shown by the fact that peach pickers, whom it is understood must help unload the trays after sulphuring, never show any desire to learn the slightest fact about the way that the sulphur house is built or operated.

According to this peach grower more air than is usually allowed in a house is an advantage and because it is a great help in making clear peaches. Too much air is bad, but the amount that will leak through the unstopped cracks in a well-built house is all right. He usually leaves his peaches in the house from four to five hours.

SELMA APRICOTS.

Selma boasts of being the home of the peach, but apricots are highly thought of too. A. J. Otis of Los Angeles has 10 acres of young apricot trees, which, owing to alkali and other troubles, have enough misses to make only approximately six acres solid. After the frosts of 1918 John Peak, who superintends the care of the place, wrote that the crop would be an utter failure, but changed his mind before long and harvested 26 tons of fruit. This was the first year of full age for bearing. In 1919 there were no hard frosts and 126,673 pounds of fruit were sold from the ten acres. The trees are Tiltons, summer pruned.

Although this is a cultivated orchard, the belief in the Selma district is that although alfalfa in peach or-

chards is not a success, in apricot orchards it is an advantage to the trees and a profit on its own account.

OF INTEREST TO ALMOND GROWERS.

(Written for Pacific Rural Press.)

"Almonds are looking well and the yield promises to exceed that of last year by one-third," said T. C. Tucker, manager of the California Almond Growers' Exchange. Continuing he said: "We hear from our intelligence agent in Spain that the Spanish crop will be rather limited in anticipation of the opening up of markets, which were closed during the war, including Germany and Austria. So the bright outlook for the marketing of almonds remains unclouded by heavy competitive yields."

Price-Determining Conditions.

"No, prices on this year's crop have not yet been named—cannot be named yet. Your own guess on a possible price today would be as good as our own. If we set and guaranteed prices today, and then, owing to any legislative measure or economic crisis, those prices were depressed before the crop was harvested, you can see where we'd be."

"On the other hand, a price set today might, by reason of a strong demand, harden considerably before harvest, the result of which would obviously be to our disadvantage for the time being. I am going East soon and the market will be gauged and the prices warranted will be determined by the time we can get delivery of the first almonds and the exact extent of the crop is known."

Cultivating the Eastern Market.

"By the way, a feature of our present extensive advertising campaign in the East consists in prizes offered for the best displays of 'Associated' almonds, particularly the best window displays. Observe that this does not mean just 'California almonds.' They must be from the California Almond Growers' Exchange—clean, bright, graded nuts. We are making this competition widely known in Eastern cities, even circularizing all the salesmen to get the crop moved quickly. For the trade buys early for its holiday needs."

Nut Specialist for Northern California.

"One other matter of interest to nut growers is that Professor C. A. Reid, Nut Culturist of the U. S. Department of Agriculture, is to be stationed in Northern California to investigate and help us with our many problems; determining the best commercial varieties from all angles; the adaptability of soils and localities for producing them, and the best methods of handling, harvesting, and processing—in fact, the whole nut curriculum.

The **BLASTER** says—
"I use **GIANT**
It gets them out
cleaner"

Professional blasters know explosives. They have tried all the different makes. Many of them say "Giant gets the stumps out cleaner." John Zurr of Santa Rosa, Cal., writes:

"From the beginning of the time I have been using powder for stump blasting and other agricultural work, I have found the powder made by The Giant Powder Co. to be the most satisfactory. Each certain percentage of Giant Powder is exactly what it is represented to be."

Tell your dealer you want the genuine Giant Farm Powders—Giant Stumping or Eureka Stumping. The Giant trademark on every box is your sure protection against imitations.

It will pay you to write today for our book, "Better Farming with Giant Farm Powders." It tells scores of money-saving ways of doing farm jobs—land clearing, ditching, tree planting, etc.

ENCOURAGING TO WINE GRAPE GROWERS.

(Written for the Pacific Rural Press.)

Growers of wine grapes, especially those in the hill districts who only have a few inches or a foot of land over the clay—land that is practically unfit for anything else but vines—will be encouraged to hear that there is a prospect in sight of retaining their beloved vineyards. Of their continued use for beneficent purposes and the prospect of reasonable remuneration for their labors.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also E A G L E Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for

bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixture, etc. And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be., Sulphur Paste, Nicotine, Black Leaf 40, etc. Fungicides and insecticides. Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO

634 California St., San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

TELEPHONE KEARNY 871.

We wrote in our issue of August 9 of experiments that had been carried out by John H. Wheeler at St. Helena with the Zante currant. While the assembly was there Mr. Wheeler incidentally told us of other experiments which he had been carrying out with regard to the production and keeping of grape juice, which appealed to us as far more promising and encouraging than the Zante currant. For if the world's markets for our grape juice and syrup can be captured and extended, not only can our beautiful vineyards still remain to adorn our hillsides and provide a living for their many votaries, but our wineries may even remain intact though their product will be non-intoxicating.

The Making of Grape Juice.

Mr. Wheeler brought out several glass demijohns of white grape juice for the assembly to sample. It was as clear and bright in color as a well-kept Chablis and just as inviting to the eye. It had been "lengthened" with about 20 per cent of water, obliterating the over-sweet taste so often preferred against grape juice. The flavor of the grape remained. No trace of sulphur was distinguishable though we were told that it was perceptible in the undiluted juice. For, in preparing the barrels for grape juice, they are thoroughly cleansed by sulphuring before being filled. No preservative whatever is used in the preparation of the juice. It is the simon-pure article as expressed from the fresh grapes, but is kept in the cellar at a temperature not to exceed 60 degrees F.

The grapes used were green Hungarians, but any wine grapes will do.

Will Crush This Year's Vintage.

Mr. Wheeler says it is his intention to crush his own grapes this fall and make further experiments. He hopes and suggests that a plan may be worked out before another season by which a large part of our vintage could be crushed and saved and then shipped all over the country during the winter and put into cold storage warehouses there to be used as needed. He will endeavor to demonstrate with his own goods this winter. He may have to make vinegar of some or perhaps induce others to reduce it to a syrup and concentrate it so as to save in the cost of transportation. The juice has to be reduced in vacuum pans to retain the color and avoid the cooked taste produced by open pans. If any of the material he handles in detail starts to ferment, he is prepared to turn it into vinegar or suffer the loss.

The grape juice under proper manipulation in the making can be shipped abroad and could be made into wine if correctly handled in its first stages. This may provide us with an added export market.

Cost of Evaporation.

W. V. Cruess of the University of California followed Mr. Wheeler on the platform and told us that the practice of evaporation for turning grape juice into syrup was thoroughly practical and practicable and would warrant the expenditure necessary for plants to carry out the operation. In a separate article is the meat of his remarks written by himself.

Applications for licenses for the exportation of wheat to all destinations in the western hemisphere and the east coast of Asia to which flour shipments are now licensed will be received for consideration at the New York office of Julius H. Barnes, United States wheat director now. The order is effective August 15 and until further orders. Applications must be made in duplicate.

Flour milled from the new 1919 wheat is quoted at \$1.25 per barrel lower in Minneapolis than that of the old crop.

Stock Raising in Western Canada
is as profitable as Grain Growing

In Western Canada Grain Growing is a profit maker. Raising Cattle, Sheep and Hogs brings certain success. It's easy to prosper where you can raise 20 to 45 bu. of wheat to the acre and buy on easy terms.

Land at \$15 to \$30 Per Acre
—Good Grazing Land at Much Less.

Railway and Land Co's. are offering unusual inducements to home-seekers to settle in Western Canada and enjoy her prosperity. Loans made for the purchase of stock or other farming requirements can be had at low interest.

The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta extend every encouragement to the farmer and ranchman.

You can obtain excellent land at low prices on easy terms, and get high prices for your grain, cattle, sheep and hogs—low taxes (none on improvements), good markets and shipping facilities, free schools, churches, splendid climate and sure crops.

For illustrated literature, maps, description of lands for sale in Manitoba, Saskatchewan and Alberta, reduced railroad rates, etc., apply to Superintendent of Immigration, Ottawa, Canada, or

"Trailerized Transportation."

2-Cylinder Cushman Engines Very Steady Power

These are the only light-weight farm engines. High speed and throttle governor, with perfect balance give smooth continuous flow of power and uniform speed, instead of violent, irregular explosions and fast and slow speeds of old-style engines. This explains why Cushman engines are so light in weight, yet more steady-running and more durable than engines weighing four or five times as much.

Only All-Purpose Farm Engines

Besides doing all regular jobs, Cushman Engines may be used for so many jobs heavy engines cannot do. 4 H. P. is original binder engine, also used on corn binders and potato diggers. 8 H. P. used on hay balers, corn pickers, etc. 15 H. P. weighs 780 lbs.; 20 H. P. only 1200 lbs., for heavy duty.

Cushman equipment is much superior to that of ordinary farm engines. Friction Clutch Pulley and Schebler Carburetor. 20 H. P. has gear-driven high tension magneto. Cooled by forced water circulating system, permitting all-day run. Moving parts enclosed and run in bath of oil. Run at any speed—speed changed while running. If you want a real farm engine to run without trouble and do all your work, come in and look at the Cushman. Not a cheap engine, but cheap in the long run.

For Pumping Work

The Cushman has a decided advantage over all other types for it can be more readily adapted to other work after pumping is over. It can also be easily moved about. It pays to have a Cushman.

For Corn Shellers, Bean Threshers, Etc.

Use the Cushman and get satisfaction from steady running.

Here and There in the Fruit Business

(Written for the Pacific Rural Press.)

Prune Picking Prices.

These vary with the crop and conditions. F. B. Smith of Saratoga is paying \$6.50 a ton for picking up prunes. The contract includes shaking the trees at the last and cleaning up the entire crop. He has a heavy yield of large prunes, the ground is in good shape, and he has tent accommodations for his extra help.

African Oranges on English Markets.

Our Agricultural Trade Commissioner in London says: "For the time being, the season for American oranges in Great Britain will be closed as oranges from the Cape of Good Hope have begun to arrive in quantities. Until freight rates are lowered it will be impossible for American oranges to compete with this source of supply."

El Dorado County Water District.

At a meeting of Farm Bureau members in Placerville last week a resolution was passed favoring the immediate organization of an irrigation district covering 30,000 acres of irrigable land. A committee was appointed to take the necessary initiatory steps and was also asked to obtain options for the purchase of the El Dorado Water Company and the Diamond Ridge Ditch Company, systems whose supplies would furnish the proposed district with water.

Plum-duff Is Popular.

The California Raisin Association has been compelled to refuse new orders till the exact amount of this year's tonnage of raisins has been determined. The demand is unprecedented. The crop estimate of varieties is: Muscats, 125,000 tons; Sultanias, 10,000 tons; Thompson Seedless, 60,000 tons; Malagas, etc., 5,000 tons. The packing houses will open early in September. The fruit looks fine and it is hoped it will be allowed to sugar up well before harvesting so as to get all the weight as well as quality possible.

Prune Harvest Is Early.

The prunes are coming down pretty fast now, and large quantities are exposed in the drying yards. A peculiarity of the season is the fact of so many sound prunes coming off in an immature condition. This may result in the fruit not weighing up to grade, as was the case about four years ago. The quality of the fruit, from its appearance as it hangs on the tree, has probably never been surpassed for so large and general a crop. The weather everywhere is fine for drying so far. The early drop needs it. It

pays to move the prunes on the tray as soon as possible.

A \$3,000,000 Almond Crop.

The first carload of new crop almonds was shipped from the warehouse of the California Almond Growers' Exchange, Chico, on August 13. It consisted of 500 bags of Nonpareil almonds and was sold to a New York purchaser. The Exchange expects to move almond carloads from now on.

The California almond crop for 1919 is estimated at about \$3,000,000, according to T. C. Tucker, Manager of the Exchange, who says that the quality this season is exceptionally fine, due to the favorable climatic conditions. The State Department of Agriculture, in co-operation with E. E. Kaufman, of the Bureau of Crop Estimates, reports 75% of a crop for the state.

200 Cars a Day.

When the grape season is in full swing 150 to 200 carloads a day are expected to be shipped from Lodi. It is estimated that if all the wine grapes which would have been made into wine were shipped it would take 28,088 cars from this one point—not counting the table grapes. It is, however, figured that half the amount will be dried or processed, which will still leave a demand for 15,000 extra cars this year. A big problem is the shortage of ice and the huge extra amount needed. Shippers will have to load their cars to their utmost capacity, and the railroad people intend to move heaven and earth to furnish ice and cars to save the crop. Shippers and railroad men have met and adopted their plan of campaign and so things ought to run smoothly.

Why We Must Shell Almonds.

During a single month—that of April, 1919, almonds imported by the United States amounted to 115,119 pounds not shelled, worth \$16,550, and 2,948,127 pounds of shelled almonds worth \$1,036,336, according to the California Almond Growers' Exchange. The protective tariff is three cents a pound on unshelled nuts and only four cents a pound on those that are shelled. The disparity of these amounts is very clearly demonstrated on the relative values of the two imports—a condition of which European growers are not slow to avail themselves. Of course we can't expect our labor to sit up and crack almonds with a mallet on a stove-lid, but with an adequate tariff our own growers will be able to furnish that million dollars worth of almonds.

Horticultural News Notes

Written for Pacific Rural Press.

A good crop of olives is reported for the season in Spain.

90 per cent of California's peach crop will be either canned or dried.

Don't forget! The State Fair at Sacramento takes place from August 30 to September 9.

Brown rot damaged the Elberta peach crop in Georgia during the latter part of the shipping season.

1200 tons of cots are said to have been turned off in the Oakley (Contra Costa County) district this year.

Less than 10 years ago 20-30 prunes were sold for 6-7 cents flat, says the Sunsweet Standard, and now we are selling 120s up for 7½ cents!

1200 tons more cherries were canned in the State in 1919 than last year, according to E. E. Kaufman of the Bureau of Crop Estimates.

Ten thousand acres of land have been brought under irrigation in Tulare County this year with pumping plants as their sources of supply. The power used is chiefly electrical.

Australia produces about 30,000,000 pounds of raisins and currants, and about 4,500,000 gallons of wine. It is suggested that the wine business will grow as her raisin output diminishes.

"The best figs I have ever eaten were growing on Catalina Island," said George C. Roeding recently. "They seem to be very successful in a coolish temperate climate such as this is. They were Kadotas—a fig with several aliases."

The California Packing Corporation, one of the largest fruit packers in the world, has purchased 4,000 acres just south of Merced at \$125 per acre, and will have the tract set out to figs and peaches.

Girls who joined the Central California fruit workers' union demurred to giving in their ages when they signed up. But the union rules require it, "so they all gave some more or less reasonable figure."

The Frel Brothers, who have 320 acres in fruit at Graton (Sonoma County) may net \$75,000 from it this year. They have a good crop of prunes and apples and a medium crop of pears.

"Ever notice that you have fewer codling-moths where you keep the ground wet up," said a pear grower to the writer last week. "I don't know whether the irrigated pears and apples give Mr. Worm the belly-ache or not, but they leave me alone and attack the neighbors' unirrigated fruit."

Sutton and Young of Red Bluff expect to harvest nine tons of dried prunes from one and a half acres. They credit this extraordinary yield to thorough irrigation.

The Yakima Valley (Washington) now promises to ship about 2400 carloads of pears, or 25% more than last year, according to the U. S. Bureau of Crop Estimates.

J. Johnson, his wife and three children of Bend (Tehama County) will pick, cut and cure nine tons of peaches (dry weight) from their ten acres, without outside help.

The Freemyers ranches near Red Bluff, owned by the father and four sons, will produce 5,000 packed boxes of peaches (Elbertas) from 40 acres this year, it is said on the young trees.

At a meeting of growers in Sutter County, it was decided to pay \$3.25 a ton for picking grapes and \$5 a ton for picking prunes. It was stated that 30 cents a box was being paid for picking figs.

Charles F. Shaw, Professor of Soil Technology in the University of California, has been named examiner of all lands offered for sale by the State Land Settlement Board.

Over 1500 applications for farms or allotments have been filed with the Land Settlement Board, of which one-third are from soldiers.

MARKET FOR AMERICAN APPLES IN ENGLAND.

(Written for Pacific Rural Press.)

Our apples are popular on British markets. From the Department of Agriculture we get the following reports: "In the early part of this year over 1,000,000 barrels of apples were imported from the United States. Much of this produce sold at or near the control price of \$13.61 per 112 pounds or nearly \$1.05 cents a pound. This is still the fixed price for imported apples which will remain till September 1, when it may be modified." The home grown apple will therefore be marketed as rapidly as possible to avoid a chance of the control price being lowered. The Australian and Tasmanian fruit crops have already been disposed of.

"In England the apple is regarded as a necessity for health purposes as well as for food. The Food Controller has extended the license for the importation of apples and oranges from September 1, 1919 to March 1, 1920. Ocean tonnage for the transportation of produce is scarce and its movement erratic." The British market in apples favors barrels rather than boxes. The pack has to be firm.

Graded Fruit Demanded.
With the heavy freight charges

only good fruit will bring a profit to the grower. Over 80 per cent of the fruit sent to Great Britain is on consignment and is sold at auction after a thorough inspection. This means that all the fruit must be correctly graded. Ungraded fruit will surely go to the huckster, and the shipper will have merely a freight bill to pay instead of making a profit at the end of the transaction.

Apples Should be Inspected.

Equal in importance to grading is condition on arrival. Shippers at a distance from the Atlantic seaboard should have a representative at the seaboard to inspect their product. A sea trip is hard on produce, and if any signs of deterioration are noticed the fruit should be sold on the home markets.

The largest crop of almonds in years is being harvested at Oakdale (Stanislaus County). This will be her most successful year.

An "IDEAL" Silo Pays for Itself

"My **IDEAL GREEN FEED SILO** is the biggest money-maker on my farm, and I wouldn't be without it for ten times its cost. My saving on feed bills the first year has more than paid for it." So writes a man who has learned by experience that the "IDEAL" silo return big dividends.

Before buying a silo, investigate the "IDEAL." Get acquainted with its superior features. Learn why it is more economical, lasts longer and makes better ensilage than any other.

Only the choicest lumber goes into the construction of the

"IDEAL" silo. The staves are of selected California Redwood, tongued, grooved, bevelled and splined by special machinery.

Refrigerator doors with "three point contact" make the "IDEAL" absolutely leakproof. They come flush with the inside walls of silo, thus preventing air pockets and spoiled silage. The ladder is securely fastened to the silo at one side of the doors. This permits easy access.

Heavy, soft-steel hoops, placed thirty inches apart, bind the silo into a true circle. Malleable iron lugs and long upset threads allow easy adjustment. Self-supporting roof — airtight, watertight foundation joint and other features too numerous to mention here — put the "IDEAL" in a class by itself.

Fill out and mail the coupon. It will bring you, free of obligation, a valuable booklet on silos.

Insure Your Water Supply

The best way to maintain a constant, never-failing supply of water is by means of a Pacific Redwood Tank.

Pacific tanks have the everlasting qualities of the redwood of which they are built. As everyone knows, water preserves instead of deteriorating this wood. The patent non-shrinking system with which our tanks are fitted absolutely prevents leakage under all conditions.

Pacific Machine—Banded Wood Stave Pipe is the best and most economical for irrigation systems and pipe lines on the farm. Made in all sizes from 2 inches to 30 inches in diameter. Write for wood pipe circular and specifications.

Suggestive Agricultural Pointers

Written for Pacific Rural Press.

Fresno Commissioner Busy.

This is one of the many busy seasons of Fred Rouillard, Horticultural Commissioner of Fresno county. The squirrel control work has been re-organized with the county divided into districts, and vigorous, systematic killing is being done in each.

The opening of the grape shipping season necessitated the organization of a staff of inspectors, whose work quickly proved of value. For some reason unripe grapes that would have greatly injured later markets were started in great abundance, by growers that should have known better, but were caught in time and held up. The office is also starting an insectary to raise parasites for the mealy bug, which has gradually increased in importance on grapes until steps have had to be taken to control it.

Model Tent Housing.

Do you want a model tent house at moderate cost, either for temporary farm help, or for other purposes? Here is the design of a tent adopted for the Valley Fruit Growers' Association, for its first community camp at Fowler. This is the fifth tent house designed by the Association, and the best. The others were too large, or too expensive, or otherwise not exactly right.

This tent is 8 by 10 in floor space. The floor and each of the sides is separate and entire from the rest of the frame, so five sides, a ridge pole and the canvas are all there is to it. Everything is tied together with bolts or lag screws, so that it can be taken down quickly and easily without injury and set up quickly when needed.

The frame proper is composed of 2 by 3's, or 2 by 4's. The sides are bolted to one another, but tied to the floor by lag screws. The walls are wainscoted 2½ feet up from the floor, then there comes 2 feet open space screened to keep out flies and mosquitoes. In front is a screened door, with springs to keep it closed. The walls stand about 4½ feet above the floor and the roof has a three-quarter pitch, making ridge pole about eight feet high.

The canvas is stretched tight over the roof and the sides can be rolled up or let down to meet the wainscoting, whichever is best.

Similar tents can be erected of any desirable size and the wire screen omitted whenever flies and mosquitoes make it seem unnecessary. At present prices for labor and materials a structure of the size described costs from fifty to sixty dollars.

Alfalfa Prices.

In the Rural Press of August 2 alfalfa hay was quoted from \$16 to \$20 in San Francisco, baled of course. In Los Angeles it was from \$20 to \$24 with Alfalfa Association prices still higher, and evidently correct. Fresno newspapers at about that time were quoting loose hay in town for \$22 and baled at \$25, while it was selling in the shock a few miles from town for not less than \$18 per ton. At the same time the writer knows of a large stack of first-class alfalfa hay sold in the citrus district of Tulare county for \$12 a ton, and other hay for \$10 a ton in the shock. The running price for the summer seems to have been about \$12 a ton in the field, in the district where the writer resides. Such variations seem queer and worth eradicating. The general idea is that prices will be upward from now on. Good crops of grain hay, good wild feed in the hills, and the replacing of horses by tractors have been responsible for much reduction in the alfalfa demand in many sections.

Irrigation Pays.

A Selma fruit grower last spring purchased a peach orchard that was rented on a share basis on such terms that he only gets 15% of the crop this season. Figuring that a pumping plant was needed to help out the supply of ditch water for irrigation he was wondering whether to put it in right away, or to wait until he could get all the crop, and decided that the sooner the water was there the better, in spite of the fact that the orchard

was a heavy producer as it was. He now feels that the increase in his 15%, added to the benefit present irrigation will do to his 1920 crop, has more than justified the investment.

Cantaloupe Growers Will Learn.

Cantaloupe growers in the Porterville and Exeter districts, who tried their hand at that crop this season for the first time in a number of years, feel that the crop has come to stay and that they can do even better in the future than they did this season. The object of cantaloupe growing in the Tulare thermal belt is to get an early melon on the market, right after Imperial melons have been shipped and before Turlock competition can be felt, and the section has proved its ability to get an excellent yield of high class melons early enough to insure very high prices.

As in the first trial everywhere, there were a number of failures, mostly on account of insufficient irrigation. A number of the most successful growers likewise, being advised to hold off the water a little before picking commenced, in order to hurry ripening, lost most of their second-crop melons and it is doubtful if they gained enough in early ripening to amount to much after all. The general conviction is that abundant moisture supplies all the way along is the thing to bring both crop and price.

One of the advantages of melon growing in a district where few are grown is shown by a packing company who contracted for melons at 85 cents a crate and were able to sell locally most of the good melons that were too ripe to ship East at \$2.00 per crate, which is not a bad profit, even for a middleman.

Concrete Lined Reservoirs.

Fence wire in concrete makes a fine, cheap, durable lining for ranch reservoirs, according to Ed. Poulsen, of Selma. He has a reservoir in sandy land so lined, 70 by 110 feet in area and 5 feet deep, and has no trouble with it. The wire is laid on 45 degree slope banks and over the bottom, the corners of the reservoir being rounded, and a two-inch layer of cement, sand and fine gravel spread over it. Although this dressing would be too thin to be of use alone, it is extremely durable when held by the fence wire. The concrete is faced with a rich mixture of cement and sand. This was the only lining that the Fresno Canal & Irrigation Company could get to last on some very weak places in their canal banks.

Tulare County Squirrel Campaign.

In the two years ending July 1, 1919, Tulare county used in squirrel killing work 142½ tons of poisoned barley, valued at \$37,000, all of which was handled by the office of the horticultural commissioner, and 21,550 gallons of carbon bisulphide, valued at \$21,981. With the bisulphide nearly one and a quarter million jute balls were used, costing \$4,080. As a result the squirrel population in the county is extremely small. Horticultural Commissioner C. F. Collins advises the poison for a general clean-up, but bisulphide to eradicate any squirrels escaping the poison. Contrary to a common idea, bisulphide is fully as killing in summer as in winter, except on adobe soil where the gas will escape through cracks, but a little more per hole has to be used than in winter. In winter the sulphide is used on jute balls and fired. In summer it is usually applied with jute balls, but is not fired.

Big San Joaquin Cotton Field.

One thousand acres of short staple cotton is being grown by J. W. Eldridge of Los Angeles on land leased from the Tagus ranch near Tulare, and present prospects are for a half a bale per acre. The planting on such a large scale was based upon the conviction that the Tulare country was admirably suited for this crop. If the cotton pans out according to prospects it is figured that many farmers will plant next year and a gin will be started. J. A. Knight of Tipton had good success with cotton last year and has increased his acreage this year.

What can a man Learn from Looking at a Tractor in a Tent

IF you have ever been to a tractor demonstration, you probably know the earnest way some salesmen have of taking you into a tent and pointing out all the fine points of the tractor they are trying to sell.

They will show you its engine and its wheels and its gears and its clutches, and tell you why they are better than those of any other tractor on the market.

Now, the intelligent farmer, when he goes to look at a tractor, wants to be shown by the tractor itself.

For eight years the G O Tractor has been showing farmers all over the country just what they wanted to know. It has shown them that it can do anything they want it to, and do it economically, and keep on doing it.

There is nothing "eye-filling" about the G O Tractor. It is a four-wheel, four-cylinder tractor—the simplest and most practical construction known. There is no loss of traction

due to the shifting of weight to the wheels of the implement. Its pull increases as the traction increases, because the drawbar is free-swaying—not rigid—eliminating all side draft and making it safe on hills.

The G O driving mechanism is the biggest advance in tractor engineering which the industry has seen. It gives six speeds forward and six reverse—a right speed for plowing in any sort of soil; a right speed at the belt pulley for any kind of machine. It is so easily controlled that even a child can operate it. All gears are enclosed in a dust-proof oil bath, adding years to their life.

The facts about the G O Tractor are open to anyone who is looking for sound, common horse-sense—not features or talking points. You may be interested, also, in knowing more about the company behind the G O Tractor—its guarantee and its idea of what constitutes real service. A post card today will put you under no obligation.

Farm Owners' and Operators' Association

Written for Pacific Rural Press.

The Farm Owners and Operators' National Association has placed an order in Chicago for a moisture tester. It is being hastened by express, and will be installed on arrival in the Stockton headquarters.

The tester is to be placed at the service of the corn and rice growers, and of all others who have products that are sold on the moisture test. The wheat grader established by the Association has been a great success, and has been patronized without cost to the farmers. Not alone have they had their wheat graded, but the net returns they were entitled to demand at the terminal points were figured out and given to them.

One fact brought out is that the wheat yield in this immediate section is not as large as the first estimates. On the "West Side," and in other sections the harvest fell below expectations.

The organization work of the Association is to be resumed early in September. The date for the big mass meeting has not been definitely set, owing to the fact that it is desired to fix one when the farmers are fully through their harvest work. Responses have come from all over the state assuring the presence of prominent farmers.

The Association is now pursuing some independent lines of inquiry into the "high cost of living," with particular reference to the charge that the farmer is gathering undue profits. In due time the result of these investigations will be given to the public.

Middlemen Officially Control H. C. L. "The people are crying for more and cheaper food," says Chairman Albert Lindley of the Association. "The President is urging Congress to give more money and power to the

Government with which to uncover profiteering. Yet the control of production and distribution of foodstuffs continues to be placed by the Government in the hands of dealers in foodstuffs.

"The Government under the Grain Standards Act has placed licensed graders in Los Angeles and San Francisco only, both far removed from wheat growing centers.

"The San Francisco 'Licensed Grader' is the 'Chief Inspector of the San Francisco Chamber of Commerce Grain Trade Association.' To this gentleman for courtesies extended and information given, the Farm Owners and Operators National Association is under lasting obligations. We farmers approve of him personally. But we do feel that we should not be compelled by the Government to look to the San Francisco Chamber of Commerce nor to its Grain Trade Association for the grading of wheat that is sold largely to that Association's members.

"It is unfortunate that the Government cannot find a responsible party to inspect and pass on the farmers' wheat, other than a man employed by the buyers of wheat.

"This same practice holds good in nearly every Government official having to do with farm products or farm regulations.

"It would seem reasonable, surely, for the Government to place a licensed grader with his comparatively inexpensive equipment in important grain producing centers of the State where the farmers and the dealers could together take a sample of wheat and have it tested officially in the presence of both.

"What chance is there for more or cheaper food when the middleman officially regulates and controls food from the farmer to the consumer?"

Wheat Seed Ranch for New Varieties

Written for Pacific Rural Press.

As the next logical step in its extensive experimental work to improve the quality and extend the acreage of wheat in California, the Sperry Flour Co. has leased the J. O. Robison ranch of 680 acres, 11 miles east of Stockton, half mile south of the Sonora road and adjoining the Griffin Ranch. Among grain farms of three counties this property is known as one of the best wheat ranches in California. Its soil is sedimentary adobe and is situated on the ridges of Little John Creek. The improvements are of the best and the property is fenced and cross-fenced. This season the ranch averaged 18 bags to the acre of Early Baart, Bunyip (Sperry No. 1) and Bayah (Sperry No. 2). The ranch will be operated by the Agricultural Department of the Company under the direction of George R. McLeod, its head.

"In our work with wheat which was begun in 1915 when the Company purchased the Australian wheat exhibit at the Panama-Pacific International Exposition," said Mr. McLeod, "we have passed the experimental stage. Our first problem was to get a variety of wheat thoroughly adapted to California conditions. How careful our work in this direction was done the grain farmers of the state well know. We have now decided on two varieties, Early Baart and Bunyip, which have been tried out under varied conditions and they have absolutely demonstrated their worth from the standpoints of yielding and milling qualities.

"The next step for us is to develop these wheats and by selection to get them absolutely true to type and hold them true. We have now acquired a good sized acreage of the best grain land and will carry out extensive work in selection, growing wheat for sowing purposes on a comparatively big scale. By selecting the strongest and best stooling plants, as well as the best headed wheat, it will be a matter of only a few years until

wheat true to type and also one much harder than ordinary varieties will be developed. The strong and healthy plants are immune to many diseases that attack weak and immature plants. This in itself will mean better yielding and milling qualities. We shall follow out a system similar to that practiced by the commercial seed grower. Selection is the only way to keep wheat true to type, and wheat that is not true to type will not produce a maximum crop. Unless constant effort is made in this direction the tendency is for the variety to run down until in the course of eight or ten years it is practically worthless.

Over and above its interest in carrying its experimental work forward this important step, the Company regards it as an excellent business proposition and the high rental it is paying thoroughly justified, for at present the prices of wheat—and according to every indication they will continue to be attractive to the wheat grower—handsome profits can be realized. The ranch just acquired is but a mile and a half from the Stanley ranch, known as Sperry Experimental Farm No. 2. The two ranches give the Company 1000 acres of high grade grain land, fully 600 or 700 of which will be sowed to wheat this fall.

EARLY DELTA POTATOES MOSTLY GONE.

British Queen, Gold Coin, and American Wonder potatoes from the Delta are practically all marketed and the early planted Burbanks are coming in. The yield was light, probably 50 to 100 sacks per acre generally. Long continued cold weather in the spring rotted a great deal of seed in the ground. The early crop planted from January to April. The main crop is of Burbanks planted in June and July for harvest from October to January. These are looking fine now.

THE
"W-W"
(Hammer)
(Principle)

ALL PURPOSE

FEED GRINDER

"The proper place to mix feed for stock is outside, not inside the stomach."

THE proper, practical, principle to employ is the hammer process.

W-W Grinders are constructed on an entirely original principle. Hay, grain—any kind of feed, is reduced to any degree of fineness by a beating process.

Nails, stones and other hard substances do not injure the mill.

The square-faced hammer while pulverizing the feed, throws out the nails, bolts or other materials that might get into the mill in the feed.

The W-W is an ALL PURPOSE Feed Grinder, practically indestructible, easy of operation and

—You can't beat the "W-W."
The "W-W" can "beat it"

with greater capacities for smaller horse power than any machine offered. It will successfully grind anything fed to stock in California. Is also used to pulverize fertilizers.

W-W mills are built in a wide range of sizes and types having capacities from 500 pounds to 8 tons per hour—a size for every feed. Write for a list of California and Arizona feeders who are using W-W Grinders, also book of letters of what they say. It will pay for itself.

MODERN EQUIPMENT

For Farm and Dairy

Modern farm and dairy equipment pays. It pays in dollars and cents. It pays in labor saved. It pays in more comfortable living. It pays in many ways. Power machinery and the substitution of mechanical methods for hand labor have revolutionized modern farming, freeing the farmer and dairymen from the long tedious routine daylight-to-dark labor and giving him his share of the good things of life.

We specialize in modern farm and dairy equipment and handle more lines of farm and dairy ranch machinery than any other farm equipment house on the coast. The California Hydraulic Engineering and Supply Co. is known throughout the State for its activity in behalf of more efficiently equipped farms and dairy ranches. If you contemplate the purchase of modern equipment of any description, write to us. Years of experience are at your command. Every inquiry answered promptly and fully.

"DURO"

Deep Well Systems

JUST the thing to bring suburban or country home right up to date.

Pumps water from wells, where depth to water level ranges from 22 to 150 feet, and supply it under pressure for all purposes about the house or grounds.

"Built like a battleship," economical and entirely automatic in operation.

Send for Duro booklet

AMERICAN PUMPS

We are distributors for American Standard Horizontal and Vertical Pumps—and Turbine Centrifugals.

They're the best pumps on the market. They cost a little more—but last longer and are decidedly cheaper in the long run.

American Pumps are famous for their large capacity and high efficiency.

We also have special pumps for direct connection to motors.

Write for Pump Catalog.

Which Way do You Make Hay

Hay harvest usually catches you in rush season—and often short handed. Come in and let us help you figure out a way to handle your hay better and quicker. **LOUDON HAY TOOLS** have been standard since 1867, and are used in every civilized country. Most of the modern hay tool ideas have originated in the Loudon factory at Fairfield, Iowa, and we want to tell you about some of the Best. The Loudon Hay Slings, Forks, Fork and Sling Carrier, and Power Hoist are unequalled. Whether you have 10 acres or 1000, Loudon Hay Tools will pay for themselves quickly.

SEND FOR FREE BOOK OF BARN PLANS AND COMPLETE LOUDON CATALOG.

UNIVERSAL Milking Machines

With a Universal Outfit, one man can do the work of three—thus actually eliminating the work and expense of two men. Solves the labor problem. Gets your milking done better and cheaper. Write for catalog.

Loudon Barn Equipment

Healthier cows, more milk, purer milk, less feed, and less labor—if your barn is Loudon equipped. The Loudon line includes Steel Stalls and Stanchions, Feed and Litter Carriers, and everything needed for the dairy rancher. Write for catalog.

ENGINES in All Sizes

We have engines in every type and size—from 2½ H. P. to 100 H. P., operating on distillate or low grade fuel oil. Our lines include Western, Faultless, and Muncie Oil Engines. We'll show you how to get the most power and the best results at least cost—and that's what you want.

See Our Demonstration at State Fair at Sacramento

Come and see these various machines in operation. Ask questions. Talk your needs over with us. The suggestions we make may save you dollars—and trouble, as well.

LIGHT FARM PROFITS!

Lighten the Labor of the Farm and Home With Delco-Light

Delco-Light is a great help in the dairy. It provides cheap power for milking cows, separating cream and churning butter. It carries cool, fresh water everywhere on the farm. It runs the corn sheller, cream separator, fanning mill, and the tool shop machines with uniform ease and efficiency. It lights all buildings with a steady light, free from fire risk.

Delco-Light Takes the Backache Out of Housework

It makes woman's work less tiring—gives her more time for rest and recreation, more time for taking care of the poultry and gardens. It brings electricity for cleaning, washing and ironing. It puts a cooling breeze in any room, with an electric fan. The modern kitchen is Delco-Light equipped; with it cooking is made easier, cleaner and better. It lights every room in the house. It brings running water for kitchen and bathroom, and for the gardens. It is the modern servant of the farm and home.

Power Farming Makes New Opportunities

(Written for Pacific Rural Press by E. E. Hodges.)

Fifty dollars a day earnings on an investment of less than \$2,000, paid the man who made it and tickled the man who paid it. Purviance Bros. and A. Schmitt of San Joaquin County are the men who were so mutually fortunate. Mr. Schmitt had succeeded very poorly at much expense and after long efforts in getting some of his fields leveled enough to lead him into the mistake of trying to grow alfalfa on it. Certainly the alfalfa could not be irrigated satisfactorily and it has rebelled. But other fields comprising 26 acres contain a beautiful stand of corn and alfalfa on checks as smooth as water in the reservoir. That is because Mr. Schmitt paid one of the Purviance Bros. \$5 an hour to level and check it right with a 15-27 tractor and leveler designed by themselves for use on their own ranch. It used to take Mr. Schmitt four days to irrigate seven acres of the 26 rather indifferently; but now he can irrigate the whole 26 acres in three days. His seven-inch pump does not run enough water to keep a man busy irrigating alfalfa on properly leveled checks; so a reservoir of 6,000,000 gallons capacity was built for Mr. Schmitt by Mr. Purviance with his tractor and scraper. Now the pump runs night and day. So the reservoir delivers a good head of water all day long and irrigation labor is efficiently employed.

Mr. Schmitt claims that his reservoir has much better banks than horses and scrapers would have made. It overflowed in two places, but did not wash out as such a new reservoir made with horses might have done. There is no seepage, although no special treatment was given.

Speedy Leveling Required.

The situation was getting critical last May when the leveling was done. Mr. Schmitt had been trying to get the reservoir and fields in shape, but couldn't. He had a herd of high-producing dairy cows. They had to have feed, but he couldn't get the fields in shape for corn and alfalfa in time. The tractor leveling at \$5 per hour cost him less than horse leveling would have cost if he could have got it done at all, but the great difference was that the tractor did it in time.

One Man Better Than Two.

One reason assigned for the greater speed and better job done by Mr. Purviance was that when the driver looks ahead, he can spot the low places and can dump there, while if another man were operating the scraper he would find it more difficult to place the dirt right or to scrape off the high places at the right spots. Two men's brains do not work alike.

Leveler Instantly Responsive.

Another reason is that the new scraper is so instantly responsive to the touch of the long lever which is in the grasp of the tractor driver. He guides the tractor and operates the lever at the same time, raising the scraper an inch if desirable, or gouging it deep into the earth and gathering up a yard at once. The tractor travels 3½ miles per hour with this leveler, which moves the earth speedily and well.

How Leveler Is Built

The back of the scraper built for the 15-27 tractor is of heavy iron, a foot high and eight feet long, with a shoe about eight inches wide angling forward from the lower edge of the back. Wings on the sides keep dirt out of the wheels at the ends. The back is supported by a two-inch axle which bends upward and backward at right angles as it comes out of each wheel, bending again at right angles to support the back of the scraper. Levers are cleverly, but simply, arranged to work this eccentric axle with but little effort. The wheels are about two feet in diameter and four inches wide.

Power-Farming Idea Grew Rapidly.

Purviance Bros. are credited with the statement that they never made a cent of money farming until they began to burn distillate, and that was

not so very long ago. They told the writer that they lost more than the price of a tractor last year by not getting their crops planted in time, though they hired extra horses.

That they are completely converted to motorized farming seeming evident when the writer found them in their Sierra foothill home, enthused at the end of their sixtieth day of threshing with a 15-27 tractor. This was the first day they had threshed any of their own grain. The powerful little tractor had pulled the 26-46 threshing machine among the neighboring hills, and at each stopping place had quickly hooked up to operate it.

The brothers had a smaller tractor previously. It had provided power to plow 200 acres. But one man could do so much more with a bigger machine that the small one was swapped off and the 15-27 was bought last May. It has been used for disking, harrowing, threshing, land leveling, and other farm work. It pulled a nine-foot weed cutter followed by a nine-foot heavy roller ¾ miles per hour on soft ground. When automobiles and motor trucks got stuck on the roads nearby, the tractor pulled them out. Soft ground seemed no hindrance to this wheel machine, and there was no objectionable packing, for it would sink only to the rims of the wheels and the lugs would kick up the surface as they turned over.

Horses Usually Idle Now.

There are four horses on the Purviance ranch—usually kept on pasture. They have to be fed whenever they are worked and that costs too much. They were used in cultivating row crops but not for much else.

The motor idea was developed in another direction by remodeling an old automobile into a truck which saved time and horseflesh on the road. The horses stay at home.

Simple Farm Forge Shop.

The tool shop is not elaborate, but it supplied the means for working out the land leveler invention. It contains a fan-forged, anvil, workbench and vice, and drill. It will soon contain a six-horsepower gas engine which will furnish power for machinery to lighten the work, and especially to be belted through a wall to run a barley crusher. Barley for about 200 hogs is crushed right at home. It couldn't be hauled to a commercial crusher and back at any rational cost.

Leveler Built to Fit Power Farming.

Having the tractor and the forge shop and a lot of land which needed leveling so summer crops could be irrigated to feed the hogs, the brothers cast about last winter for a satisfactory leveler. Previously they had a man with horses level one twelve-acre field, but he left it so the water had to run up hill in some places. The corn crop didn't do much, and barley was put on this piece.

Finding no leveler which could be operated by the tractor driver with quickness and precision, they set about in their forge shop to make one to suit themselves. The first one was ready in February—six feet wide for use with the small tractor. It didn't suit themselves then in several features which were gradually improved as new ideas came. There was plenty of opportunity to try it out at home; and in the process the up-hill irrigation on the 12-acre field was so corrected after the barley was taken off that it now has a beautiful stand of corn almost automatically irrigated.

Another field of eight acres had been plowed toward the fence so many times that it was in no shape for irrigation. Four horses worked fourteen hours trying to level this and the tractor did the same amount of work in 2½ hours, finishing the job.

Leveler Makes Money on the Side.

Looking around for some ready money, they found a rancher who wanted twelve acres leveled. A contractor using draft stock had offered to do the job at \$40 per acre. Mr. Purviance offered to do it with his

P.O. Riding Beet Puller

Gets Every Beet - Whole and Unbruised Saves Money, Beets and Labor

A FOUR-WHEEL Beet Puller that can be easily drawn by two horses under ordinary conditions, but with a hitch that can be set for two, three or four horses. Adjustable for width of rows.

When in operation the seat and tongue pivot—easy to guide. When lifters are raised the tongue is rigid for transporting. The lifting bars can be swung in or out for small or large beets, or to suit soil conditions. The lifters raise the beets, running at a shallow depth, reducing draft to a minimum.

The front wheels hold the puller to the row and assist in cutting foliage. Ample clearance for foliage—clogging is eliminated. Equipment includes rolling coulters, three-horse eveners and neckyoke.

This mere outline of a few features of the P.O. No. 2 Beet Puller does not by any means convey an idea of its worth. That it is made right—in design, construction, strength, and all those other things that a beet grower has a right to expect, is further evidenced by the fact that it bears the famous P.O. trade-mark. It is now a product of the Harvester Company.

Ask the International dealer for a folder fully describing and illustrating the P.O. Beet Puller.

at \$25 per acre. They made \$6 an hour on that job. Mr. Schmitt's work was done about the same time, and he has yet more for them to do.

Bigger Leveler for Bigger Tractor.

It was thought at first that a six-foot leveler was the biggest that one man could handle easily. But with the bigger tractor, they needed a bigger leveler and they made one eight feet wide which surprised them by working as easily as the small one. In loading the scraper there is little or no weight on the wheels. When the weight is put on them by the lever, the eccentric axle seems to lift itself and the scraper so it dumps without a lot of hard work and just as gradually or as suddenly as desired. This feature make it efficient in building and finishing the check levees or ditches or any embankments. Mr. Schmitt says one man does more work with this outfit and does it better than five men could do with teams and scrapers.

AGRICULTURAL NOTES.

California potatoes are being shipped to Arizona, New Mexico, Texas, Utah, Colorado, and Oregon.

Lima beans cannot make half of the tonnage this year as last according to the U. S. Bureau of Crop Estimates.

No flies and no fly screens are necessary when fly traps are kept handy. Good fly traps and fly baits are on the market.

California onions are being shipped to New Mexico, Texas, Colorado, Louisiana, Utah, Nebraska and Illinois, among other States.

Barley is still piling up on the levees of the Delta district on account of the bargemen's strike.

Onions are being imported to New York from Spain but greater quantities are being exported from New York to the West Indies.

Ladybugs are being brought by the sack from Tuolumne County to eat up the aphids in Stanislaus County beans. A sackful costs \$2.75 and is generally enough to clear up 3 acres.

Cabbage acreage in the ten principal producing States is much lower than was harvested in 1918, which was about ten per cent less than in 1917. This may indicate better prices for California winter cabbage.

Tomatoes are showing rather poor, spotted, diseased conditions in various parts of the State as reported by the U. S. Bureau of Crop Estimates. But as a whole, the August 1 report shows better condition than a year ago and better than the average for the past three years.

Cantaloupe shipments from Turlock have been running over 60 carloads per day. They go to Boston, Baltimore, New York, Chicago, Cleveland, Cincinnati, Detroit, Kansas City, St. Louis, Omaha, Minneapolis, Pittsburg, Denver, Ogden, Salt Lake City, Butte, Montana, Eugene, Ore., Seattle, and various other points, mostly north of the Mason & Dixon line.

WHEAT VARIETY EXHIBIT AT STATE FAIR.

Labeled sheaves and grain samples of the various kinds of wheat obtained from the Australian exhibit at the Panama-Pacific Exposition by the Sperry Flour Co. and tested out in a big way since then will be mighty interesting to State Fair visitors. Baart and Bunyip will be emphasized in the Sperry exhibit and competent people will be in charge to tell about the conditions required for the different varieties in California. The bulletins on wheat which were mentioned in our issue of Aug. 16 will be distributed to Fair visitors.

INSURANCE AGAINST ACCIDENT

THE **MONEY-MAKER** SILAGE CUTTER

—will enable you to put up your silage without accident to man or machine. The PATENTED SAFETY YOKER reverses the feed rollers automatically when the hands get too close and protects the operator; the PATENTED CUSHION DRIVE absorbs the shocks of operation on gears, traveling apron and rolls, and protects the machine.

We Can Ship Your

YOUR CHANCE TO SEE THE LATEST IN TRACTORS.

WHAT ARE THE LATEST improvement in tractors? There is just one way to find out for yourself—that is at the State Fair. The California Tractor and Implement Association has its plans all made, and the State Fair management is co-operating more fully than ever before to make the tractor and implement tents contain all that is best and latest in power farming—aside from automobiles, gas engines, motors, and motor trucks, which will be on exhibition elsewhere. Arrangements are in the hands of a committee of which Prof. L. J. Fletcher, of University Farm, is chairman.

Visitors will be handed a complete catalogue showing specifications of all the tractors, threshing machines and tractor plows available in California. It will have about 200 pages, and will contain articles written by authorities on lubrication, deep tillage, threshing, steel products, motor cultivators, etc., but no advertising.

Tractors will not operate under their own power on account of noise, fumes, and dust. Many will be operated by electric motors and their insides will be exposed in working order with attendants always glad to go into details.

A rest room for wives and families will be included, so if the women and children do not feel like looking at the machinery, they can rest awhile. Ice water will be handy and rice hulls will carpet the tents to keep the dust down. Uniform signs and decorations will make the whole place attractive. A restaurant will be handy. An aisle will lead into the motor truck tent. You are invited to come and see how you can motorize your own farm to best advantage. Ask questions of attendants about all the tractors that might fit your ranch.

Tractor exhibitors entered up to this writing are:

Lauson, Cleveland, Bates Steel Mule, Sandusky, La Crosse, Victory, Monarch, Fitch Four-Drive, Trundaar, Caterpillar, Moline, E-B, Bean, Wallis, Best, Huber, Twin City, Avery, Case, Yuba, Wisconsin, Beeman, Fageol, Fordson, Waterloo Boy, I. H. C., R. & F., Hart-Parr.

Implement and accessory exhibitors are the Killefer Mfg. Co., New York Lubricating Co., Pacific Implement Co., Weinstock-Nichols, Union Oil Co., Splittorf, Oliver Chilled Plow Works, John Deer, H. C. Shaw Co., and Harris Mfg. Co.

IRRIGATING FROM SURFACE PIPE.

In the Tulare thermal district underground concrete pipe is the standard and practically universal method of irrigation. In the alfalfa, dairying districts around Tulare open ditches and surface irrigation pipe is common. This is in part due to sandier soil, taking water rapidly, and to raising alfalfa more than fruit. A big head of water and quick irrigation is desired instead of a small head and slow irrigation.

Out of many Tulare ranches irrigated with pipe that of J. D. Soultz will show conditions. He irrigates 120 acres from a 6-inch pump, driven by a 15 horse-power electric motor. From the pumping plant the water is delivered into an underground concrete pipe line with outlets to which the surface irrigation pipe is connected. He has 1000 feet of this, 9 inches in diameter, leading to almost all parts of the ranch, and would not go back to open ditches for any sum of money. The waste of water in open ditches is enormous and the work of holding back the water, opening checks and all the rest of it takes lots of time, to say nothing about the labor of cleaning the ditches. Johnson grass is a pest in that section and dairymen have to be very careful not to poison their cattle on alfalfa fields infested with the grass. Open ditches are a terrible thing to spread weed seeds, but none ever come from a pump and pipe line.

The pipe can be laid out in about two and a half hours. After the water is started all that is necessary is to remove enough joints to bring the pipe back to the check nearest the beginning of the pipe line. This is done at half-hour intervals and takes only a minute. The rest of the time can be put in at other work. At night the stream is delivered from one check to another by cutting the banks. This is the standard system on ranches irrigated by surface pipe and the results explain the popularity of the method.

The Victory tractor is a new one on the California market, Grissell Bros. of Stockton having undertaken its distribution in California about two months ago. It is a three-wheel type of 9-18 horsepower, worm drive, ball and roller bearings throughout, and all working parts enclosed.

A friend of ours found he could get a tractor several weeks before he needed it. He got it while the getting was good. Otherwise he might have waited a month when he ought to be working.

It is poor economy to use lubricating oil too long in a tractor, yet many people hate to throw it away soon enough. We recently found a farmer who uses it to kill lice on his hogs. It works fine.

At Last—A Complete Plant for Farm Light and Power

Fairbanks-Morse quality is built into every part of this 40-light "F" plant—mounted complete on one base. Instrument board is conveniently placed over dynamo—power is our famous "Z" engine which successfully operates on kerosene. Can also be used to run a washing machine, churn, cream separator.

The entire construction is extremely simple—workmanship and materials the best possible. A touch of a button starts the plant—simply touch another button to stop it. Your nearby dealer will tell you you all about the "F" plant and will show you what it will do for you.

is known for its dependable service. A steady stream of power flows from its mighty motor through all spur gear direct to the draw bar. Light tractor weight combined with great traction power; high wheels that roll easier and increase the amount of surface "grip"; center draft on all loads, preventing loss of power from side pull. The combination of all these—with a dozen other Huber features—makes the Light Four the last word in tractor dependability—and fuel economy, too.

Write for "The Tractor in the Making", an interesting story of the development of the tractor as reflected in the successive models of the Huber for more than twenty years.

(Continued from page 221.)

1,000 acres with a tractor in one season as Mr. Critchett did (including the double cropping and double plowing) is certain to observe some features of tractor operation that are worth passing on. His ways of handling the machine will be suggestive to many another tractor driver.

New Oil Every 40 Hours.

One of the most uncommon practices is claimed to have yielded remarkable results. The reason that 200 acres could be plowed without removing a spark plug is that every 40 hours of work saw all of the oil drained from the crank case while it was hot. The crankcase was then washed out with a couple of quarts of coal oil and drained all night. In the morning three gallons of new oil were put in. Part of the old oil was used on exposed gears and the rest was invariably dumped out.

The remarkable feature was stated by the man who sold the oil for this tractor. He said that Mr. Critchett used the least oil per day's operation of all the tractor users supplied by him! This oil is the lowest priced on the market and is tabooed by many tractor men.

"It is not the kind of oil you use, so much as how you use it," says Mr. Critchett. "People who think they can't afford to throw away the crankcase oil every 40 hours really can't afford to do anything else."

This seems proved by the fact that after plowing 1,000 acres and harrowing it down, the compression in the cylinders shows that they are not scored badly enough to justify replacing the cylinder linings at a cost of about \$3.50 each.

Heavy Load but Not Overloaded.

And it must be remembered that the tractor, which is still in such good condition, was loaded above its rated horsepower against the protests of the tractor sales company. This brings us to one of the three important factors in successful tractor operation named by Mr. Critchett. You must know the draft of the implements you are pulling.

"But," said the writer, "that varies in each kind of soil at different seasons of the year. How can you tell when the tractor is pulling too much?"

"It happens," said he, "that this tractor has only two forward speeds, two and four miles per hour, both being on direct drive. We generally work it in low gear. Whenever we think perhaps it is overloaded, we make a test by shifting to high gear. If she can keep moving then, we know that the load is safe on low gear. We have never pulled a load continuously that could not be pulled on high without opening the throttle wider."

"One reason we get all the power there is in the distillate is that we use an extra long sparkplug, which projects nearer to the center of the combustion chamber than common plugs. That gives the explosion more even and instantaneous force."

"Another reason is that we have a water feed which mixes hot water with the explosive mixture, and when the explosion comes it generates steam, which gives the piston a little extra shove—steam helping the gas engine! It also helps to keep the engine free from carbon. We adjust the amount of water frequently by gradually giving it more as long as the engine keeps picking up. It takes a steady stream in hot weather."

Easily Started on Cold Mornings.

"We had weather here last winter when we drained the radiator at night for fear of freezing. Yet we never had any trouble starting the tractor next morning. The chief reason it started so easily on cold mornings was that we used a priming mixture of one-fourth commercial ether and three-fourths gasoline. About a teaspoonful of this into each priming up was usually all that was necessary. A pint can of ether lasted a month."

"The operator of a tractor must pay careful attention to bearings. He must tighten them before they become too loose, but if he makes them too tight they would burn out quick. He must also be able to clean the inner and reassemble it properly. It doesn't take long to learn that."

More Satisfactory Hired Men.

A marked advantage in power farming over the use of stock is the class of men who work for you as Mr. Critchett has found out. During the spring and summer, he had two tractioneers, both real gentlemen and fit to have around a man's home, whether the women folks were there or not. Thus was avoided the class of men who are personally annoying.

The tractioneer frequently has more intelligence than many mule drivers and he uses his time to better advantage with less waste motion. The tractioneers were paid 65 cents per hour plus eats and sleeps—probably more than some of the neighbors paid. But it enabled Mr. Critchett to get the best men, and the best men are the cheapest, as he says. He pays only by the hour. This eliminates dissatisfaction in rush times when a day's work is often twelve to fifteen hours.

The bonding house for whom Mr. Critchett worked so long before he went back to farming wants him to come back. But he says, "Never again. I get too much satisfaction from power farming, to ever return to city work."

McDONALD PITLESS SCALE

Whenever you receive change in a business transaction you always count it. Of course you do! Well then, there is more reason why you weigh everything you buy or sell.

Get a McDonald Pitless Scale, and it will soon pay for itself. It is easy to erect and is guaranteed to weigh accurately for 10 years. It is the original pitless scale and thousands of them are in use.

Our Victory Model

A TWO-YEAR REVISION—OVER 100 IMPROVEMENTS

After 16 Years

This new Mitchell Six comes out in our 16th year of car building.

We have built and watched tens of thousands of Light Sixes. They have given the Mitchell a world-wide fame.

Now our engineers and specialists have worked two years on this new model, to embody all we have learned. There are more than 100 important improvements, based on vast experience.

You should measure up these new-day standards before you buy a fine car now.

Lasting Newness

The object of this new Six is to give you lasting newness.

Most cars satisfy when new. In this new Mitchell that newness will endure.

Part by part we have added strength. We are using better materials, new heat treatments, 123 drop forgings.

New and radical tests are now applied to every vital part. Inspection is carried to extremes.

Reducing Wear

There is finer workmanship. We have spent over \$300,000 on new machinery and equipment to attain this.

There is utter smoothness in the motor, less waste of power. The crankshafts are twice balanced on two new-type machines.

Gears are perfectly mated. Transmissions are tested in a sound-proof room. Engines are tested, and for hours, with electric dynamometers.

The bodies are extra-staunch. The top will stay new. The luster of the finish is enduring. The rear springs have been proved unbreakable.

A thermosat on the motor controls temperature. The gasoline is perfectly vaporized. Thus we cut down fuel cost.

These things mean much to owners. They mean less wear, less upkeep, less operating cost. And they mean much extra service.

Learn the Facts

Ask for our catalog and learn all the improvements, or see our nearest dealer. These are qualities every car owner wants. Now so many know them that Mitchell sales are breaking all our records.

A Six like this at the Mitchell price is due to our factory efficiency. We build the complete car—motor, chassis and body—under scientific cost-reducing methods. This model plant has long been famous for them.

When you know the facts this car will be your first choice in this class. Write us today.

Alfalfa Seed Situation Is Firm

[Written for Pacific Rural Press by R. E. Hodges.]

"Will the price of alfalfa seed go up?" we asked L. V. Richardson, dean of the alfalfa seed growers in the Byron district of San Joaquin county whose seed has an enviable reputation and insistent demand as far east as the Mississippi river.

Higher Price Reasonable.

"I hope it will go to 35 cents," said Mr. Richardson. "It would be very reasonable at that. Our seed consumers are dairymen. Dairy products have advanced more in price than alfalfa seed would be at 35 cents. After all, at that price, seed-

ing would cost very little more than seeding with grain. And the advantage of several years' crops from one seeding would bring the annual cost per acre to a very low figure. Alfalfa seed ought to go up in proportion to other products and in proportion to labor. Even then there is more risk in growing alfalfa seed than most any other crop. Out here I have 26 acres going to seed. There are streaks where you can see at a distance that the blooms have fallen without setting. There are other streaks where the pods have set without seed and where seed have set but are blighted. You might expect bees to pollinate all the blooms, but my field is surrounded by bees and is full of them. Still I have those unpollinated streaks.

"We know that irrigation prevents seed setting, but we don't know much more than that about controlling our crops. Eight hundred pounds per acre has been known, but 300 pounds is considerably above the average crop of seed here.

Seed or Hay?

"If we didn't attempt to grow seed we would get five cuttings; otherwise we get only two cuttings with possibly a little pasture or a light late cutting, after the crop is off.

"Straw from the thresher or 'clover huller' that threshes the seed is not good hay, though sheep will eat it. So we must get enough for the seed to make up for the value of three crops of hay (less the cost of handling it) and in addition we must recover the cost of threshing, cleaning, and marketing the seed. We must also assume the risk of rain such as discolored our crop last year. Our taxes are going to be higher too, on account of so many bonds to pay interest on, and that is part of the cost of production."

Alfalfa Supply and Demand.

Besides being right to expect higher prices on the basis of increased cost of production, all conditions seem to justify them on the basis of supply and demand.

Lots of alfalfa has been plowed up to raise field crops, and not much has been replanted. Many fields are so old that they will be plowed out this fall. We saw some being plowed out last week.

August 1 crop reports of the U. S. Bureau of Crop Estimates indicate a shortage of hay in California and the U. S. This has already boosted the price of hay and added that much to be required on seed prices to balance what seed growers missed by not cutting hay.

The month of July saw a reduction of 182,000 tons in the prospective total California hay crop. Since grain hay was off before July 1, the decrease is due almost entirely to lowered condition of alfalfa. Lack of customary irrigation water is a chief reason. Acreage of tame hay was estimated to be the same this year as last in this State, but the acreage of wild grass cut for hay is shorter and wild pasturage conditions are generally poor except in the northern coast and mountain counties and in those counties with a great deal of lowland pasture.

Hay prospects for the entire U. S. fell off 5,000,000 tons during July. That is more than the whole California crop.

With a short crop, alfalfa planting this fall and next spring will in all probability be very extensive in order to supply forage for livestock next season. This will naturally boost the price of seed.

Dairymen are going into their business stronger and they will require additional acreage. At the same time, we are a little independent of outside markets here, said Mr. Richardson, because several new irrigation and subdivision projects are getting under way close around us and we can sell our whole crop locally. Anyhow several outside buyers and the Farm Adviser have been trying to buy our crop this season for shipment east.

On the other hand, it may well be remembered that just now there is a demand from the East for fall planting. This demand will fall off as soon as eastern seed is mature. It will be too late to plant in the East then anyway. So our growers may well unload before Eastern seed is ripe or else expect to compete with it. The country east of the Rockies produces a great deal more seed than we do, but due to the climate it is not generally so bright colored and clean. We have this advantage to balance our handicap of distance. Our seed is bright, viable and clean due to our dry summer. The Byron crop is claimed generally to germinate over 90 per cent, and even some of the rain-damaged seed last fall germinated 83 per cent.

Byron Seed Growing Started.

Alfalfa seed growing in the Byron district was started by Mr. Richardson in 1911 when he fixed up a grain thresher to hull it for the neighborhood. He has grown seed on various fields ever since then, and neighbors have taken it up. All but one other was planted with locally grown seed so no noxious weed seeds or pests have been imported. The area left for seed in this district this season is only around 250 acres. It will average 200 to 250 pounds per acre, so there will be but little if any more than a carload of seed to sell. Two years ago this district produced over 40 tons; but last fall the early rains hurt the crop and most people prefer the sure crops of hay rather than uncertain crops of seed.

Mr. Richardson's seed field is next to the oldest alfalfa in the Byron district. It was planted ten years ago, was never irrigated until two years and never seeded until this year.

Harvesting Alfalfa Seed.

Alfalfa is cut for seed when most of the pods have turned brown in mid-September, though the stalks are still green and carrying some blooms. Spikes in full bloom the middle of August will have ripened by cutting time. The crop is cut with a regular hay mower equipped with winnowing rods which roll it into a winrow as it is cut. Winrows are bunched at once by hand-forks into piles which can be pitched onto a wagon without pulling them to pieces. They cure out in the shocks without shattering much. Mr. Richardson's remodeled thresher has long since been superseded by regular clover hullers which do a better job, especially on partially dried pods. He still has the only cleaner in the country however, so is in best position to know of the crop.

Imperial county and Modoc, Lassen, and other northern mountain counties produce most of the California alfalfa seed. A great deal is produced in Arizona, but more is grown in the central west.

Alfalfa Seed Don't's.

There are only a few don't's. Don't try to grow alfalfa seed under irrigation. Don't try to grow it on rich land which produces rank growth. Don't even thresh alfalfa in which dodder has been growing. Don't put seed on the market with any amount of noxious weed seed in it. Don't try to get a setting without bees. Don't be too sure that you want to retail it yourself.

A DOZEN PROGRESS POINTERS.

1. Feeding balanced rations.
2. Learning to judge livestock.
3. Joining a cow-testing association.
4. Keeping a complete set of farm account books.
5. Providing better sanitary surroundings for livestock.
6. Joining co-operative livestock marketing associations.
7. A holiday to visit your most successful neighbors.
8. Selling scrub sires and purchasing registered ones.
9. Community ownership of a good stallion, and perhaps a jack.
10. Growing crops especially suited to produce feed for your livestock.
11. Making the boys partners in the farm by giving them a lamb, calf or pig.
12. An hour a day spent in figuring out methods to save steps, make the work more efficient and more profitable.

The Hinman Milker

For ten full years Hinman Milkers have been demonstrating in thousands of dairies that they save a vast amount of time, that they are a good thing, a benefit for the cows, that they are so simple anybody can quickly learn to use them, that they are thoroughly dependable—that they are one of the finest and safest investments the dairyman can possibly make.

It is the leading milking machine as proved by the fact that more Hinmans are in use than any others.

It is the simplest milking machine—because it has practically nothing to get out of order and no big stationary vacuum pump, vacuum tank, gauge, relief valve, long pipe line or mechanical pulsator.

It is the most economical milking machine—because absence of all the extra devices just mentioned makes the price of the Hinman lower than others and makes the cost for power, fuel, upkeep and repairs lower.

And the Hinman has proved itself over and over again to be better for the cows than hand milking. The gradual suction produced by the outward stroke of the piston on the individual pump is natural, soothing and comforting to the cows. The suction is easily adjusted to suit different cows.

The valve-chamber in the pail cover works entirely automatically. It hasn't even a spring to get out of order. Suction closes the valve tightly; stopping of suction and weight of milk

opens it. This large, open valve-chamber is as easy to clean as a tumbler!

The simple, cone-shaped teat cups fit the cows—because they are made in different sizes for cows with different sized teats. They, too, are easy to clean.

The Hinman Principle is such that not only are nervous cows and hard milkers made gentle and easy, but there are a large number of cases on record where use of the Hinman increased the cows' milk flow. Its easy, uniform action on the cow keeps the udder and teats in a more normal condition than most hand milking does.

Complete, Illustrated Catalog Free. Write today for your copy. A postcard will bring it.

Lowest Cost

Because the Hinman is simple—has no stationary pump, vacuum tank, relief valve, pipe line and pulsator—its cost is about half that of other milkers.

Hinman Milking Machine Co., Oneida, New York

C. F. DANIELLS, Hughson, Cal., Distributer for California and Oregon.

NOW IS THE TIME!

When your summer crops begin to ripen then is the time for a silo. A safe, sure and profitable means of preserving the full value of your summer's work. Much of the food value is lost when fed in the old manner. Take corn, for instance—the stock is worthless when it becomes dry and 50 per cent of the blades and husks are lost in handling. Save the entire plant by putting it in a silo. Your stock will eat it to the last ounce. More nutrition, more milk, more profits.

Let a "SIMPLEX" take care of your stock. Don't eat up your profits by paying the usual "out of sight" winter prices for dry grain and mill feed. Fill a "Simplex" now and your feed worries are over. The

SIMPLEX SILO

is indestructible. Staves are of Douglas Fir and one piece—the height of the silo. This is a distinctive feature. No weak end-joints to leak and cause trouble. Hoops are made of new steel. Doors are of the two-way hinged type, air-tight and will not sag. The "Simplex" is fitted with the Crisell Tangent Top, which automatically keeps the Top in a true circle under all conditions.

Heavy galvanized cables are attached to top and are crossed diagonally to foundation anchor bolts imbedded in the foundation. This forms the SIMPLEX WINDPROOF INTERLOCKING ANCHORING SYSTEM.

Fill Your Own Silo

The PAPEC ENSILAGE CUTTER has a one-piece solid semi-steel frame. No wood or bothersome rivets to cause trouble. The Papec has six fans instead of the usual three or four. They are attached to the cutting wheel and "throw and blow" a steady stream of ensilage. Papec cutters require less power to operate and will elevate to the top of the highest silo, operating at their low speed of 600 to 700 revolutions per minute.

The Papec is a money-saver and a money maker. We guarantee it to do better work at a lower upkeep cost and operating expense than any other.

The "Simplex" Silo and the Papec Cutter are two money makers. They are permanent investments and will yield big returns each year. Send for our descriptive folders.

Summer Cow Comfort Pays

(Written for Pacific Rural Press by E. H. Whitten.)

Whatever adds to the comfort of the dairy cow increases her yield of milk. For a hard-working cow to suffer in the hot sunshine, or be tormented by flies, means a drain on her vital forces that will cause a loss at the pail. Leaving the humane side out of consideration, her distress should at least appeal to the owner's business sense.

Probably there is no artificial shade quite as good as that furnished by trees, and there are so many quick-growing trees that adapt themselves to our climatic conditions that there is little excuse for not having abundant shade. Where the eucalyptus flourishes, ideal shade for summer and wind-breaks for winter can be quickly provided by planting these trees, while cottonwoods, catalpas, locusts and other quick-growing trees adapt themselves to the colder climates.

Swat the Flies.

It is just as necessary to keep cows free from flies as it is to protect them from the hot sun. A cow, being a highly nervous animal, is easily annoyed and excited, and excitement always causes a shrinkage in the flow of milk; also the annoyance prevents her from feeding to her capacity, and she loses in flesh. An average decrease in milk flow of from 25 to 40% is not uncommon as the direct result of flies and extreme summer heat. And under existing conditions, with a keen demand for dairy products, and with prices at a high mark, it will pay every dairy farmer to use every possible means to eliminate the fly evil.

It can't be done? Wrong you are. We have seen almost flyless farms, and you can have one if you will make up your mind to it. Remember this—flies do not travel far, even if they do have wings. They stick pretty close to their breeding and feeding places, and if you have them they are a crop of your own raising.

Flies are hatched and spend most of their lives in filth. The barn, the corral, the manure pile, drains, cess-pools, the flesh of decaying animals, the swill barrel—all such places are favorite breeding spots. Keep them clean; use plenty of lime, and the flies will brand you as inhospitable and give you a wide berth. It has been found that borax will destroy all fly eggs and maggots existing in manure. Use one ounce to every bushel of manure. Sprinkle it more plentifully at the outer edges of the pile, as this is where the maggots congregate. Cart the manure to the fields as fast as possible so that Mrs. Fly cannot use it for her nursery.

Other requirements for keeping flies away are darkened barns, stable sanitation, hanging burlap in the barn doors to brush flies from the cows, baited fly traps outside the barn, and spraying with fly repellents. The latter is effective, but requires repeated applications. Repellents should be used with care, as no effective one has yet been devised which will not taint the milk slightly.

Home-Made Sprays.

Many different patent sprays are on the market, some of which are effective, but many are unsatisfactory in addition to being extravagant. They generally consist of some coal-tar product combined with either fish oil, oil of tar, or resin. Under ordinary conditions the dairyman will find it more economical, as well as more effective, to make his own fly spray, and this can be quickly and easily done.

To prepare kerosene emulsion—one of the cheapest and best home-made fly repellents—dissolve one-half pound of yellow soap in a gallon of soft water heated to the boiling point, and with this combine 2 gallons of kerosene in a barrel where the solution can be churned vigorously. Dilute this mixture with 6 gallons of water. This amount of emulsion is sufficient for spraying 100 cows and should be prepared only as needed. When smaller amounts are required they should be prepared in the proportions given.

Another excellent spray is made of 4½ quarts coal tar dip, 4½ quarts fish oil, 3 quarts kerosene, 3 quarts whale oil and 1½ quarts oil of tar. Add these ingredients to lukewarm soft water in which 2 pounds of laundry soap have been dissolved, and the total brought up to 30 gallons by adding more soft water. This amount is sufficient to spray forty cows twice daily for a period of ten days. This spray serves to rid the cows of flies and does not cause the coats to become thick or harsh, although dust adheres more easily.

If a spray is desired which contains resin, take two cakes of laundry soap, dissolve in warm water, add 1½ pounds resin, 1½ pints fish oil and enough water to make 3 gallons. Boil the mixture until the resin dissolves. When ready to use, stir in ½ pint kerosene. Apply two or three times per week as required.

If there are only a few cows in the herd a hand sprayer will answer. If a large number are to be treated a very simple spraying apparatus may be constructed by making a portable cart from a half barrel and wheels, to which is added a spray pump and nozzle. By using this cart two men can spray a herd of forty to fifty cows in five minutes. The cost of labor plus the ingredients used in the spray will be practically one cent per cow daily, while the increased milk production, greater comfort to the cow and milker, and maintenance of more sanitary conditions, makes the investment an exceptionally profitable one.

THE SILO HAS COME TO STAY.

Have you a silo? If not, the chances are your herd is not most economically fed, for a silo is generally the source of the cheapest and best feed.

A good pasture is conceded to be the ideal feed for livestock. A silo is a pasture under cover, the contents of which can be used at any time of the year.

Silage can be produced at less expense than the usual hay or grain crop. Figuring the rent of land, plowing, cost of seed, planting and cultivating, it costs 72 cents per ton to grow silage, and the cost of putting it in the silo is figured at 74 cents—a total of only \$1.46 per ton.

The question of whether or not it is profitable to feed silage was settled long ago. The silo has come to stay. It is one of the requisites of good business farming, and the dairyman who puts off the erection of a silo limits the ability of his cows to make money for him.

Milk utensils should be kept perfectly clean. You may exercise extreme care in keeping cow barns scrupulously clean, but all your efforts will amount to nothing unless every utensil used is kept in a sanitary condition.

MAKES HENS LAY

LACTEIN

CONDENSED BUTTERMILK

FOR HOGS AND POULTRY

MAKES HOGS FAT

BUTTER MILK IS NATURE'S FOOD AND TONIC.

Lactein is pure buttermilk as it comes from the churn, pasteurized, super-soured and condensed. It contains all the health-giving food and tonic values of the original buttermilk without the useless bulk of water. On account of its high lactic acid content it will keep almost indefinitely.

Lactein is now recognized as one of the most necessary food digestive agents known for both growing hogs and poultry, due to the large amount of lactic acid it contains. The lactic acid aids digestion and assimilation, causing the hog or fowl to digest all the good from the grains given them to eat, and to eliminate all the dead and disease matter from the digestive organs, thereby promoting growth and preventing disease. Lactic acid is considered the best tonic, appetizer, liver and bowel regulator known for hogs and poultry.

COSTS LESS THAN 2c PER GALLON TO FEED

* One gallon of Lactein mixed with thirty gallons of water and fed with the usual grain feed will show greater gains than from feeding the grain alone, besides, it will keep the hogs and poultry healthy and their appetites keen.

If your dealer does not handle Lactein, write us for our booklet and prices.

Livestock Queries and Replies

Pigs Have Thumps.

To the Editor: I have a litter of nice fat pigs a week old that are suffering from what looks like palsy. When they attempt to rise their bodies seem convulsed in a backward and forward movement. Tell me the cause and cure.—E. V. B. Roseville.

[Answered by Livestock Editor.]

Evidently your pigs have thumps which occurs when they are too fat and have too little exercise. Put all affected pigs into a large wooden box, with sides high enough so that they cannot jump out and let them chase about and squeal for a couple of hours in endeavoring to get back to their mother. Repeat once or twice a day until the pigs lose their surplus fat and the twitching and convulsions cease. Another way is to drive the sow out of her pen, and when the pigs become hungry they will chase back and forth and squeal in trying to get to her, and thus get the needed exercise. Reduce the sow's feed and make the piglets take exercise daily.

Will Twin Calves Breed?

To the Editor: One of my best cows has just had twin calves. A neighbor says that they will not breed. Is this so?—A. V., Chico.

[Answered by Livestock Editor.]

Twin bulls are as sure breeders as bulls of single birth, and the same may be said of heifers that are twinned together. They are as sure to be breeders as any other heifers. But when a heifer and a bull are twinned together, the heifer is known as a free-martin. The bull twinned with a heifer is as certain to be a breeder as a bull of single birth, but the free-martin heifer is almost sure to be sterile. Only a very few free-martins have been known to breed and the chances are very small that they will ever reproduce. Consequently, as a rule it is not advisable to raise free-martin heifers, as they usually result in failures as breeders and are worth no more than their beef value.

To Save Cut Udders.

To the Editor: I have a cow whose

udder has been badly cut from a barb wire entanglement and one teat is partly severed. Can I save it and what shall I do?—T. S. L., Santa Rosa.

[Answered by Livestock Editor.]

Hold the teat in place by hand and insert a milking tube at the normal opening. Work it up through the milk duct, thus connecting the cut portions. There should be a flange at the lower end which will keep the tube in place and allow it to remain until the wound is healed. Make several turns of the tube at each milking so that the flesh will not grow to it during the healing process.

Requirements for Selling Butter.

To the Editor: Where do we have to send our farm butter to have it tested for tuberculosis so that we can get a license to sell it?—P. A., Lodi.

[Answered by Livestock Editor.]

If you want to sell butter to outsiders you do not have a sample of the butter tested for tuberculosis. Instead, it is necessary for you to either have your cows tested or pasteurize the cream. If you have only a small dairy you probably will not want to go to the expense of putting in a pasteurizing plant, so it will be best for you to have your cows tested. The certificate of a local veterinarian will not be sufficient. Write to J. P. Iverson, State Veterinarian, Sacramento, and he will send one of his state deputies to test your cows.

Silage vs. Shredded Corn Fodder.

To the Editor: What is the food value of shredded corn fodder as compared with silage.—J. L. M., Sonoma.

[Answered by Livestock Editor.]

Pound for pound, shredded corn fodder contains nearly three times as much actual feed as silage, but the silage is more palatable and, as the cows like it better, there is much less wasted. When dry fodder is fed, a great deal of the coarser part is left uneaten, while with silage the loss is small. Feeding experiments conducted at the Ohio Experiment Station showed that a ton of corn made into silage will produce from 35 to 50 per cent more milk than the same corn fed as dry fodder.

SCALES REMOVE THE GUESSWORK

There is a great need of platform scales on farms where livestock is fed. With high-priced feed and high-priced livestock the farmer must feed in a scientific manner, and this means more than merely choosing good stock and giving a certain ration. If he has beef cattle, for instance, it means that he should check up frequently during the process of feeding and know just what is being accomplished. If he has to wait for the proof of his efforts until marketing time comes he may find that his feeding has been carried on at a loss.

With the aid of scales he may test his theory and his practice from week to week. If the scales tell him that the animals have not made the gains that he thinks they should have made, then he knows that something is wrong and he can make the correction.

Another advantage is that in keeping records of individual animals one soon learns to judge which is the best type to feed for the largest profit.

Aside from the value in feeding stock, the farmer has an opportunity to weigh his hay, grain and other crops marketed. He can drive his barley over the scales and know how much he is taking to market. Heretofore the farmer who has had to rely on the weight at the selling end has often harbored the suspicion that he has been deceived, because the grain has not weighed up to his expectation. The scale will remove such a suspicion and the farmer will not have to guess at the weight of his load.

The scale, therefore, has become a necessity on the farm run according to modern business ways, and it is a good investment in a great many cases.

Van Nuys

Is fast becoming the dairy center of Southern California.

Why?

FIRST—On account of the abundance of aqueduct water.

SECOND—Silt soil free from alkali and hardpan.

THIRD—Less than one hour's distance by auto truck over fine boulevards, to the heart of Los Angeles markets.

FOURTH—Ideal climatic conditions.

FIFTH—Unsurpassed home, school and living conditions, all city conveniences.

Among the foremost dairymen of the Pacific Coast to recognize these facts is George Platt, President of the Los Angeles Creamery Co., who has recently purchased 1040 acres one mile north of Van Nuys and is now preparing to care for 1000 cows on this property.

Poultry and Rabbits for Profit.

(Written for Pacific Rural Press by R. H. Whitten.)

THE MARKET IS READY FOR CAPONS.

Ever taste capon? Try to imagine something better than the sweetest, juiciest and tenderest piece of meat you ever put in your mouth, and you will have some idea of what it is like. It is not new, even if you have never tasted it. The Chinese knew of it centuries ago; the Greeks and Romans practised caponizing; and today in European countries epicures not only know what capon is but insist upon having it.

The introduction of the capon to the American table is comparatively recent, and here in California no great progress has been made until recently. Many who tried caponizing gave it up, not because they did not succeed with the birds, but because the demand was light and the market too variable. However, when I saw capon on the menus of three different restaurants last week, found it in one cafeteria, and in walking through chinatown saw three crates of magnificent capons in front of a Chinese fish and poultry store, I said that at last the demand must be heavy enough to encourage Rural Press readers to raise capons for profit. So here goes. What is a capon? It is an unsexed or castrated male bird—one from which the reproduction organs have been removed. What the gelding is to the stallion, the steer to the bull, the wether to the ram, and the barrow to the boar, the capon is to the ordinary barnyard rooster.

How He Changes!

As with other male animals so altered, the disposition and appearance of the capon changes. He becomes docile and sluggish; the comb and wattles cease to grow, causing the head to appear small; the hackle and saddle feathers develop beautifully, making up for the loss of voice, since the crowing disappears. He never fights or courts trouble, and is easily kept within bounds. Because of his more peaceful disposition he takes on weight rapidly with no more than the ordinary amount of feed. Also, when finishing off, the capon fattens more readily and economically than the cockerel.

In the same length of time a capon will weigh one-half more than he would have weighed as a cockerel. A cockerel of the American breeds will weigh from 4 to 5 pounds when 8 months old; the same bird, if caponized, will weigh from 6 to 8 pounds. The flesh will be softened and of finer texture and superior flavor, thus giving it a premium value on the market sometimes amounting to double the price paid for a cockerel. Putting it tersely, the capon will eat as much as one cockerel, weigh as much as two, and sell for as much as four. Figure it out, and you will find that at an average weight of only 8 pounds the capon will make you a net profit of at least \$1.25—generally much more.

The use of capons for raising chicks is becoming more general. They seem to develop a motherly instinct, and while they are being fattened they can be used for rearing chicks, thus doing away with the necessity of having artificial brooders, as well as giving the chicks more natural care. Or, if they are not used for brooding, they can be run with the hens. They will not molest the hens, and the eggs will still be infertile.

Breeds for Caponizing.

Large capons bring the best prices; consequently it does not pay to caponize small fowls such as Leghorns. The Plymouth Rocks, Wyandottes, Reds, Light Bramas, Cochins, Indian Games, Langshams, or crosses of these breeds make fine capons. Orpingtons are fine for ideal flesh production, and their white shanks and shin make them show off to advantage.

The proper age at which to remove the reproductive organs is when

the cockerels weigh from 1 1/2 to 2 1/2 pounds, depending upon the breed. At these sizes the sexes of the birds can be determined, yet they will not have begun to develop sexually. Thus, if a chick is hatched in early spring it can be operated on before extremely hot weather begins, and will be ready for market during and after the holiday season.

Easy To Learn.

The operation is not difficult, and is easily learned, but it is best to practice on a dead bird first. There are a number of different makes of instruments on the market, a good set costing about \$5. The directions coming with the set should be studied carefully, and the use of each instrument learned before attempting the work. If a bird dies from the operation the flesh is fit for food, for death is caused by severing a large artery, and is not materially different from bleeding the bird in the neck.

Not much difference will be noticed in the newly made capons and young cockerels for the first month or so, but later the capons will begin to get long legged and awkward; then they will begin to body down and take on fat in surprising amounts.

Try a few capons this summer. Don't plunge blindly into capon raising simply because it sounds good. Caponize just a few at first and see how they turn out. Then see what kind of a market exists, or what kind you can develop. And then you'll be able to decide for yourself whether or not it will be best to go into it on a larger scale next year. The chances are you'll be mighty well satisfied.

RABBITS CATCHING COLD.

My rabbits seem to have colds and sneeze a good deal. What can I do for them?—Mrs. A. D., Elk Grove.

The most important thing is to find out what caused the trouble and change the conditions. Drafts will give rabbits a cold and they will sneeze just like human beings. They must be watched and treated or the cold will develop into snuffles, and there is no cure for this disease but the axe. After being sure that your rabbits are free from dampness and drafts you should give them a treatment of eucalyptus oil. Put it in a small oil can, hold the rabbit's head back carefully and squirt a few drops of the oil into each nostril, allowing time for it to get into the nasal cavities. Do this each day until relief comes. It will prove helpful to give a warm mash mixed with a little linseed meal.

PEEPS AND CLUCKS.

Poultry and pet stock fanciers will see more varieties on exhibit at the State Fair this year than ever before. There will be many new features, including daily pigeon races in connection with which some of the famous 500-mile war pigeons which were stationed at Mather Field will be on exhibit. The means by which these birds are liberated from flying machines will be shown.

The liberal use of a 2 per cent solution of Zenoleum, Kresol, or any good coal tar disinfectant about the poultry house after cleaning it will keep it sanitary and comfortable for the hens. The hen is naturally a clean animal and will repay efforts in this direction by producing more eggs.

Hens never wash as many other birds do, but rid themselves of insects by wallowing in the soil. Where the ground is hard, some means of dusting should be provided and everywhere this should be done during the winter months. A dusting box about 3x5 will be large enough for most farm flocks and should be placed where it can be reached by sunlight in the winter time. Fine light, dry dust is best, but sandy loam is good. Road dust is excellent if not filthy.

Western Meat Company

SAN FRANCISCO, CAL.

Write for our booklet,
"PROTEIN FOR PROFIT."

Coal or wood ashes may be mixed with the soil if desired.

Growing pullets do better if they have some kind of animal food, such as skim milk, butter milk or beef scraps. Under normal conditions pullets on the farm obtain enough insects and worms, but on account of the dry weather this season the supply may be limited in some sections. Plenty of milk or buttermilk is generally available on the farm, but if not, it will be worth while to use beef scraps. Or if tankage is used for hogs, this can be substituted.

In locating a poultry house, select a spot that has natural drainage away from the building. A dry, porous soil is preferable to a clay soil. In most localities the building should face south, which insures sunlight throughout the year. Allow about 3 square feet of floor space to a bird. Proper ventilation and sunlight mean a dry house and healthy birds.

Many farmers feed only whole grain to their hens. A hen's gizzard is capable of grinding all kinds of grain, but when egg laying is taken into consideration it will be found more economical to have part of the grinding done by machinery. However, a happy medium should be observed and at least half of the grain should be fed whole, as the muscles of the gizzard need exercise. If you feed the ground grain moistened be sure to have it a rather dry, crumbly mash and not a gummy mixture.

This is the time of year when farmers are inclined to become rather slack in caring for their hens. There are no mating problems to confront them, the hatching season is over, the young stock is at an awkward age, and the old stock is in a faded, ragged condition. Apparently there is little to keep up the farmer's interest, so he just lets things go. But next winter he will wish that he had been a little more particular during these hot days, for the youngsters will not be as large as they should be and the old hens will be out of condition. So don't let that tired feeling get the best of you during these hot days, but remember that attention given the birds now will pay big.

Egg day will be celebrated in Petaluma August 30th. A committee has been appointed in each rural district to visit the poultrymen and collect eggs and a big time is expected.

The July business of the Tulare Co-operative Poultry Association was the largest of any July in the history of the organization, with a total of \$24,045 which exceeded the business of a year ago by \$3,000. The month's business was handled at an overhead expense of .0384 per cent.

TESTED FEEDING METHODS.

At the University Farm, where different combination of different feeds have been tried, the following mixtures have been adopted as best under present day conditions.

Dry Mash—5 pounds wheat bran, 5 pounds wheat shorts or middlings, 5 pounds ground barley, 2 pounds soy bean meal, 3 pounds beef scraps, ½ pound charcoal, 1-10 pound salt.

Scratch Feed—1 pound cracked Indian corn, 1 pound whole milo, 1 pound barley. Or 1 pound barley, 1 pound oats, 1 pound milo. Or 1 pound milo, 1 pound barley.

A variety is very essential as it increases palatability, and the greater the number of ingredients used the less the tendency of the ration lacking some necessary mineral salt.

Every ration should possess adaptability to the needs of the fowl, palatability to increase digestion, and variety to increase appetite. It should be properly balanced and should have some natural tonic effect. It should be of low cost by the selection of ingredients of local production. Methods of feeding are important; regular systematic attention is absolutely necessary.

Scratch feed should be fed in deep litter; dry mash in hoppers constantly before the birds.

Give tender green feed daily—all the hens will eat. They should have some animal food, such as buttermilk, skim milk or beef scraps. Grit

he says "it's a world beater"

and the man who wrote this had no "fish to fry"—only eggs to hatch,—and Charters Incubator and Regulator has helped him hatch them. It will be worth your while to read the letter reproduced here. Mr. Crews knows a lot about incubation, and his experience is worth hearing about.

CHARTERS INCUBATOR

(equipped complete with Charters Regulator)

—have been adopted by dozens of other poultry raisers, with from one to one hundred machines —with the same results. Many are discarding all other makes,—and write us that with the Charters, an incubator cellar is not necessary.

How the Regulator Works:

It's the two thermostats that do the trick—actually anticipating any change of temperature, and automatically adjusting the size of the lamp flame to meet the new conditions. The atmospheric temperature may vary 70 degrees, yet the egg chamber will vary less than half a degree.

The big fuel tank, a unique feature of the Charters Regulator, holds a supply that will keep the lamp running for from two to three weeks, without refilling. In actual use, one refill, and one trimming a week is all that is ever required.

Write Today for Catalog—

or, better, order your Charters equipment now, in time for a successful fall hatch.

The Regulator (easily attached) is

ENOCH CREWS
Seabright Pioneer Hatchery

Charters Manufacturing Co.,
Santa Cruz, Calif.
Seabright, Calif.
June 23rd, 1919.

Gentlemen:

Your incubator is a world beater. I have thoroughly tried out the incubator itself, as well as the regulator, and I have concluded that I would never run off another hatch with a machine without your regulator being attached. Not only this, but I do not want anyone to hatch for me unless they have the Charters Incubators.

As you know, I bought fourteen Charters Incubators of 80 capacity Street, Santa Cruz, Calif., a lady who had never run these machines for me, hatching out a total of 19,333 chicks, an average of over 384 chicks out of every batch. I believe this is most remarkable record and it proves conclusively to me that your incubator is a most superior product.

A little incident convinced me as to the value of your regulator in a remarkable manner. I left a number of eggs, one day for a few hours. Upon my return I found the temperature of all the other machines way high and the temperature in each of them around 110. The Charters, on the other hand, had not varied one degree as the outside thermostat was working in conjunction with the shutter burner has cut down the flame to a point, thereby shutting off the heat and keeping the temperature down. So convincing was this test of your regulator that I decided never to hatch again without it. Showing that I am at home in this regard, I have had my order for 50 Charters Incubators, 500 egg capacity, to be delivered at 50 Charters Incubators to be delivered to me in August, 1919.

Yours truly,
Enoch Crews,
SEABRIGHT PIONEER HATCHERY

and charcoal are necessary as digestive aids and there should be mineral matter in the form of shell and bone. Experiments at Davis have not shown any material advantage from the use of any particular grain, but hens not accustomed to a grain may have to be given time to learn to like it before the same results can be looked for.

The food values of the different grains are so nearly similar that they may be used interchangeably according to cost, but it should be remembered that the hens will do better on a mixed ration of two or more grains. The purpose of the mash is to add to the grain ration a greater percentage of protein and to help the hen by furnishing her with a portion of her food in ground form; also to turn by-products unfit for human consumption into nutritive and palatable eggs and meat.

Based upon experiments covering three years, the conclusion is that the egg mash should contain 15 per cent animal products and 10 per cent of some high protein vegetable product like soy bean meal; the balance to be fillers like wheat bran, wheat shorts and ground grains.

A good motto to hang in your hen houses: "An egg a day keeps the hatchet away."

A few onion tops chopped fine and fed to the little growing chicks will be a variety to their green feed. Try them and see how they are relished.

Breeding pens, runs and yards should be plowed or spaded up at least once each year. Ground in time becomes foul and may retain disease germs.

Clean all drinking vessels each day and thoroughly scald them out every week.

GET BABY CHICKS NOW—Write for free booklet on fall chicks. See why they pay. Several varieties very week. Only good, strong youngsters shipped. Stubbe Poultry Ranch and Hatchery, Box 87, Palo Alto.

THE HOME CIRCLE

SACRIFICE.

By J. Corson Miller.

Sing not to me of earthly power,
For winds make sport of the dust of
kings;
In many an immemorial hour
Men fought and bled for trivial
things.
Sing me the prayer that lifts from
some white heart,
As Earth's immortal part.
For deeds that live to gain reward,
And dreams that barter Love for
Fame:
These all shall die as with a sword,
And be forever linked with shame.
The great white vision born of pain
and death,
These have eternal breath.
And as a comet sweeps the sky,
To reappear through cycling years,
So shall Love's deeds supreme and
high
Enkindle hope again from tears.
Sing me Love's utter sacrifice and
loss—
Christ's death upon the Cross.

A LITTLE HEROINE.

Florence Montfort was a happy girl when it was decided that she should visit her Uncle Robert, who lived on a farm out in Kansas. Having spent all her life in a city, she looked forward to this as to a new kind of an existence, and so it really was, and she was not disappointed in thoroughly enjoying its novelty.

She liked to enter into all that was going on, especially, at first, to get up early in the mornings and go out in the barnyard to watch them milk the cows, and soon begged to be allowed

to learn to do so herself; so Susan, the girl who attended to that business, gave her permission to try to milk gentle old Sukey.

"But she has a dreadful way of moving around, Miss Floy, so you must watch her," said Susan. Florence agreed to do so, and was getting on famously with her pail nearly half filled when Sukey took a notion to change her position. The new milk-maid was off her guard, and in attempting to snatch the pail, lost her balance from the stool she was sitting on and the next minute found herself with the pail and stool on the ground in a pool of new milk.

"So well splashed," said her cousin Rob, "you couldn't tell which was which."

The day after her arrival on the farm, Rob, who was the oldest boy and about her own age—which was thirteen—said to Louis, his brother, two years younger:

"I say, Lou, what a pity she isn't a boy! We might have some fun with her, but I don't see how we are going to get along with a girl, and dressed up in good clothes all the time, too!"

Only a few days later Louis expressed himself in equally confidential terms.

"I cannot see what's the matter with you, Rob. I think she is just as good as any boy, and a good deal nicer."

"O, of course she is. Since we have got acquainted, she will do very well, for she can tell the best kind of stories," was the reply, with an air of superiority.

She frequently met with such mishaps as she did when learning to milk, such as being chased by the old gobbler out of the barnyard when she went out to feed the chickens one cool morning with a red shawl around her, and another time slipping off the pony into a mudpuddle when she was riding on a man's saddle. But though the sweetness of her disposition was shown in all these little things, it was an occurrence which happened later which came near having a terrible and tragical ending, that proved her possessing the traits of a true heroine.

It was a pleasant Sunday evening when Uncle Robert came in, saying briskly:

"Well, the omnibus is waiting—room for a few more. Who is going to church this evening?"

The omnibus was really a nice spring wagon, and the drive to the village was only a couple of miles over a good, smooth road, yet no one answered but Aunt Charlotte.

"I knew I should be crowded, yet there is still room for one or two more, so you might as well get your hats, boys," continued Uncle Robert, with a sly twinkle in his eyes.

"I would just as lief let Louis and Floy go, as I went last Sunday evening," replied Rob.

"O no, Rob," said Louis, "you may have my seat and I will stay at home and take care of Bertie."

To which Bertie spoke for himself: "No, Cousin Floy is going to stay with me; she promised me she would, and tell me a story how the prairie caught fire and nearly burned up some children, if I wouldn't tell the boys she got scared at a cow and fell down in the mud."

"O Bertie! and you said you would not."

"O Cousin Floy, I didn't mean to, indeed I didn't; it just told itself," exclaimed the child, bursting into tears, as he realized what he had done.

The boys shouted with laughter at Florence's expense, in which the grown people could not help joining. Bertie's tears were dried with a kiss of forgiveness from Florence, and then his papa went on making his arrangements for church.

"You boys are very kind to each other," said he; "your self-sacrificing spirit is certainly commendable, but I think you may both come with us. As Florence went to church this morning she perhaps prefers staying at home tonight. Bertie will be company for her, and Susan and Jerry are

both here for protection."

As soon as they were fairly off, Florence seated herself for the business of entertaining her little cousin, when Susan's voice was heard from the kitchen: "O please, Miss Floy, wait just a few minutes till I finish up my dishes, I want to hear it all so bad."

"Yes, we'll wait for you, Susie, but you'll have to hurry up," answered Bertie, as he arranged himself in a comfortable position for listening, with his curly head down in the middle of the old-fashioned settee and his feet over the arm.

Susan did her best to "hurry up," but church was probably more than

DREADNAUGHT
BLAZING-AWAY-IN-COST-DEFENCE!

LET'S GO

A State Fair is educational; it's the best excuse in the world for needed change and rest. Observing is the most pleasing mode of learning. It puts us up on our toes—makes us alive to improvements that should be applied to our daily life—things that put the "skids" under hard work and encourage thrift.

To further encourage the good work, we would like to start a miniature State Fair in mother's kitchen, to demonstrate that a state of affairs exists that could easily be overcome—a wonderful improvement made by the installation of a Dreadnaught Burner for the making of real gas from coal oil. The same stove—no changes and no smoke, soot or fumes. Operates on gravity—starts with a piece of paper. Safe, reasonable and forever satisfying. The Burner is guaranteed and the best valve ever put on the market goes with it.

The Great Task of Construction

With the coming of peace the Bell System faced an enormous construction program. Conditions arising from war resulted in the wiping out of the reserve equipment normally maintained, and necessary to give prompt connection to new subscribers. The release of industry and accumulated growth of population now makes telephone demands almost overwhelming.

Telephone construction, including buildings, switchboards, conduits, cables and toll lines, must, from its inherent nature, be undertaken in large units. A metropolitan switchboard, with its tens of thousands of parts, may require from two to three years to construct and install.

Only great extension can meet the

present excess burden of traffic and provide for future requirements. Extension which cares for immediate demand, only, is uneconomical and calls for continuous work of such a character as to be frequently detrimental to the service.

During the war the Bell System devoted all its margin to the needs of the Government. The great task of getting back to normal pre-war excellence of operation requires the reestablishment of an economic operating margin capable of taking care of a larger growth than has ever before confronted the Bell System.

Construction is being pushed to the limit of men and materials; while every effort is being made to provide the best, present service.

half out before Florence was fairly started in her story. It was something she had read in a book, but told in her own language. Her audience was small, but so deeply attentive she spared no pains to please, and it was in vivid language that she portrayed the hard and lonely life of a settler and his family in the heart of a prairie, where he had at last succeeded in getting a comfortable home built and some of the conveniences of living around him, when one day they discovered that the prairie was on fire. There was no way to escape, for should they attempt to flee the fire could travel faster than they. It was at the end of a long, dry summer, so they were surrounded with combustible material. Their only hope was to clear a circle around the house; then, O how they worked, to the very smallest child, and it was still burning, burning; and then how they stopped in despair, and it was still burning, "Miss Floy," interrupted Susan from her seat on the doorstep, "everytime you say, 'burning, burning,' it seems to me I smell something burning."

Florence was a little startled and got up and walked to the open door. As she did so she saw distinctly a light shining through the crevices of a small, two-story building across the yard which they called the "tool-house."

"Could Jerry have taken a candle into the toolhouse?" asked Florence, as she knew this was contrary to her uncle's orders.

"O no, Miss; Jerry has gone to a neighbor's," was Susan's reply.

"Then get me the key, quick, something is wrong," she said in a breathless tone as she started to run toward the building.

Even before the door was opened she saw that it was on fire inside. It was too far from the house or barn to injure them unless the wind was blowing, but they pumped, carried water and were doing their best to subdue the flames, which were rapidly getting ahead of them as Jerry came running across the lawn screaming something in a voice that was hoarse from the effort made to make them hear.

Florence stopped for an instant, saying: "What is it you are saying, Jerry?"

"The powder, Miss, the powder! Run for your lives; there's enough to blow up half the farm!"

For one moment she felt as if her blood was turning to ice. She remembered instantly the tin can of powder and just where it stood at the top of the ladder by which you reach the second story of the building. The thought of her uncle, whom she loved so dearly, how long and how hard he had toiled for this comfortable home for himself and family that in a few moments would be in ruins. Then she thought of her own dear parents, her loved home and her darling brother Tom.

"Yes, Tom would do it," she said to herself, "he would not hesitate, and with God's help I'll try," and drawing her skirts tightly around her, she darted across the intervening space and into the door, apparently throwing herself into a sea of flames.

Both Jerry and Susan rushed after her to drag her back as they saw her running toward the building, and reached the door just in time to see her almost flying up the ladder, and then to see the flames had reached the foot, rendering her return impossible. Seizing Bertie in his arms, Jerry ran at the top of his speed across the lawn and out of the gate, meeting a vehicle coming in at a furious gallop. Its inmates were too bent upon reaching the burning house to notice his frantic efforts to stop them.

Uncle Robert, too, remembered the powder, and from the instant they had noticed the fire until they reached the spot his thoughts were divided between heaping bitter reproaches upon himself for not having been more prudent and in supplications to the Almighty to avert the dreadful catastrophe which was threatened. Harder to bear than aught else appeared the thought of injury to his loved niece, for whom he had begged so hard to have with them this summer to fill the place of an only daughter who had died. Almost as if in answer to his prayer, the first object

his eyes rested upon as he sprang from the wagon was Florence standing upon the limb of a tree that extended to the window of the burning house.

It bent and swayed beneath the little form, though she lightened her weight by clasping one arm around the bough above her, but in the other she held tightly clasped the can of powder.

"Catch it, Uncle Robert," she cried, as he came under the tree, "catch it, and then I can get down easily."

Uncle Robert did not afterward often speak of the fire, or of anything relating to it, but when he told Florence's father about it, some years later, he said: "Never, if I live to be a hundred years old, can the picture be dim in my memory of how I saw Floy that night, standing out as it did in the bright light from the flames. On that slim bough she looked as though floating in the air, and I felt that she had indeed been an angel in our household."

"How did you happen to think you could step out on that limb, Floy?" asked Louis.

"I did not think of it. I only thought I might be able to throw the powder out to Jerry, or beyond the reach of harm."

"And then, just think, you would have got burned up like those poor people on the prairie," said Bertie.

"Why, I never said they got burned up, Bertie; the good Lord was just as kind to them as he was to us, and they were saved by using the very thing that might have destroyed us, for it was by strewing powder around that they destroyed the dry grass in a circle about their house and saved it and themselves."

The PREMIER BURNER

The much talked about PREMIER BURNER will be the greatest single attraction at the State Fair. * * * Its perfect performance has been more than was expected or thought possible from a Kerosene Oil Burner.

We are pleased at the prospect of meeting so many of our old friends at the Fair * * * and we want to take advantage of this opportunity to say, that, you have helped the PREMIER in its development. Your faith and encouragement have been an inspiration, and have made the great volume of its business possible.

Don't Go Through Another Winter With Wasteful Stove-Heating!

Don't endure this!

Enjoy real comfort!

GET rid of your coal wasting, muss-making unhealthful stoves, now and forever! In their place install a Mueller Pipeless Furnace and on the coldest winter nights enjoy the comforts of a well-heated home, moist healthful air, with the pleasant thought that you are saving from $\frac{1}{3}$ to $\frac{1}{2}$ on fuel. Your fuel bill at the end of the winter will prove this saving. But be sure it's a

MUELLER PIPELESS FURNACE

THERE'S even greater difference in pipeless furnaces than there is in stoves. All pipeless furnaces are based on the same principle—Nature's laws of warm and cool air circulation. But there is a big difference in the application of these laws.

The Mueller Pipeless Furnace, the carefully designed product of an organization with 62 years' experience in building heating systems of all kinds, is the only pipeless furnace that correctly applies the basic principles of pipeless heating. Every part is properly proportioned for most efficient and economical heating.

Guaranteed to Heat the Whole House Comfortably

A written guarantee goes with every Mueller Pipeless Furnace installed. Whether it's an old house or new, 3 or 4 rooms or a dozen or more, the Mueller is guaranteed to heat every room com-

fortably. And it does—letters from home-owners from coast to coast prove it.

Easy to install, no floors or walls to tear up. Built to last as long as the house.

Study the Many Exclusive Features in the Mueller Book

Learn how the Mueller Pipeless is built so it has greater heating surface—how the register face is made so it delivers a greater volume of heat—how the air chambers are built for free and unrestricted passage of air—how the hood and casing construction effect greater efficiency.

It's all explained in a logical way in the Mueller book—"The Modern Method of Heating Your Home." Get this book to-day and plan on a fuel saving winter and a comfortably heated, cheerful, healthful home.

COTTON.

The cotton market is somewhat quiet and bearish, and cotton growers are actively apposing all legislation framed with a view to fixing an arbitrary price for their product which it is believed by some will advance to as high as 40 cents a pound if not interfered with. Imperial Valley and San Joaquin Valley growers are optimistic over the prospects of a good crop and a good price. Some contracts have been entered into in the Imperial district at 30c.

The New York market early this week ranged about 30 and 31 cents with few sales. The Southern spot markets ran about as follows: Galveston 31 cents; New Orleans 30.88 cents; Savannah 31.25 cents; Augusta 30.12 cents; Memphis 33 cents; Houston 13.25 cents.

LOS ANGELES.

The following are the prices actually obtained in Los Angeles by wholesale buyers from retailers and others at the beginning of this week for the commodities below enumerated. The figures are obtained from the Bureau of Markets U. S. Dept. of Agriculture:

APPLES.

Five cars arrived. Newcrop, Alexanders, apple boxes, \$2.75@3.00. Gravenstein, bulk, 5@6c per lb.; packed, \$3.10@3.25; No. 2, \$2.65@3.00. Red Astrakhans 4@5c per lb. Crab apples, \$2.00@2.25.

BEANS.

Kentucky Wonders, 3@3½c per lb.; practically no demand.

BLACKBERRIES.

\$4.50@4.75 per crate of 30 baskets.

CANTALOUPE.

Two cars on track. Quality and condition generally good. San Fernando local Honey Dews \$1.35@1.50. Tip Tops, \$1.50@1.65. Rockfords \$1.25@1.50. Paul Rose, \$1.50@1.75.

CORN.

Roasting ears, 60@65c per lug box of 3 dozen.

CARROTS.

30@35c per dozen bunches.

CUCUMBERS.

Local stock, lug boxes, 20½@25c.

CELERY.

Local best, \$1.00@1.25 per dozen bunches. Crates best, \$4.50@5.00.

EGGPLANT.

Best 4@5c per lb.; poorer less.

GARLIC.

Local, 40c per lb.

GRAPES.

Five cars arrived. Local and northern Thompson Seedless, best, 5@6c per lb. Tokays, 8@9c; Malagas, 6@7½c; Muscats, 5½@7½c; Rose of Peru, 7@8c.

GRAPEFRUIT.

Local fancy, \$3.50@5.00; poorer, \$2.50 up.

LEMONS.

Fancy, \$6.00@6.75. Local packed \$4.00@4.50. Loose, some ripe, \$3.00@4.

NECTARINES.

Two cars arrived. Best, large, 7@8c per lb.; smaller, 6@7c per lb.

ONIONS.

Seven cars arrived, 7 cars on track. Demand and movement slow. Home-grown White Globes 90c@1.00 per lug box, \$2.90@3.00 per crate. Yellow varieties, \$2.50@2.85 per crate, lugs, \$1.00@1.10.

ORANGES.

Valencias medium size fancy, \$5.25@5.75. Local packed, \$3.00@4.00.

PEACHES.

BARLEY.

There was no local movement in barley this week, and little interest was shown in the gain on the exchange. December sold a few cents off last week's quotation, \$3.20 being the best price quoted. Spot barley, for which there was very light demand, was unchanged. Feed \$3.15@3.20. Shipping \$3.20@3.30.

OATS.

Oats are weak and in light demand. Red feed, per cbl. \$3.00@3.25. Red for seed. Nominal. Black for seed. Nominal. Recleaned Red or Black for seed. Nominal.

CORN.

The demand for corn seems well satisfied for the present and very little of the grain was moved. Quotations were maintained however.

California	\$3.80@3.90
Egyptian, choice	Nominal
Milo	Nominal

POTATOES, ONIONS, ETC.

The grain was moved. Quotations were slightly higher this week, this change is regarded as temporary and the market for both potatoes and onions is weaker. Receipts are more plentiful than the previous week, but there is no increase in demand. Sweet potatoes are lower, with garlic higher. While the prices of tomatoes are unchanged this week continued warm weather in the growing districts will probably have the effect of lowering the price in the near future. Most of the vegetables were moving rapidly this week with practically none of them showing higher quotations. Some Oregon celery was on the market and found ready buyers at a dollar a crate.

BEANS.

The bean market continues in the dumps over the campaign against the food profiteers. Statements have been made that enormous quantities of beans have been kept in storage in this vicinity and the intimation given that they have been held for a higher market. As a matter of fact beans is practically the only food product that has shown a considerable and with few exceptions a steady decline since the close of the war. The best information indicates that the holders have made every effort to dispose of their stock, but there has been no demand at any price. The facts seem to be that California growers raised more beans last year than are needed and they are now suffering from the attacks for their patriotic efforts by those half informed.

Bayos, per cbl.	\$6.25@6.50

EGGS.

While eggs showed some fluctuations during the week, they were not violent and the tendency was downward. So far as known there have been no shipments made from this territory to the East either from the bay region or points of productions, and reports from storage warehouses show but little difference from last week. Receipts in San Francisco have shown but a slight increase over last week, and all these

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Nearly all markets on all varieties remained steady, with a few fluctuations towards a downward tendency on plums and peaches.

The previous week had shown an advance on peaches but during the past few days, owing to Middlewest rejections on account of the strike situation, shippers were compelled to move cars East in heavier supply than their judgment dictated.

The lower market on plums during the past few days was due more to increased supplies than to general market condition.

The Bartlett pear market was somewhat affected by Northwestern offerings, the Washington stock arriving in fairly good condition, but on account of the California stock being of superior quality, prices ruled fairly regular.

Malaga shipments are fairly heavy but the market has been able to receive the stock at good prices.

Tokays are coldring rapidly and taking sugar. Shipments from Florida are now under way and will be in full swing in the Lodi district about the latter part of the month.

Average for the week:

NEW YORK—Elberta Peaches, \$1.17; Crawford, \$1.08; Tuscan, \$1.78; Bartlett Pears, \$3.73; Thompson Seedless, \$1.77; Malagas, \$2.25; Muscats, \$1.90. BOSTON—Bartlett Pears, \$3.34; Elberta Peaches, \$1.20; Crawford, \$1.08; Tuscan, \$1.43; Nectarines, \$1.47; Thompson Seedless, \$1.93; Malagas, \$3.10; Muscats, 2.25.

CHICAGO—Bartlett Pears, 3.44; Elberta Peaches, .98; Crawford, .90; Tuscan, 1.47; Malaga Grapes, \$2.68; Thompson Seedless, \$1.56.

Special Citrus Market Report

Los Angeles, Aug. 18, 1919.

The market for Valencia has slackened up somewhat owing to the prevalence of deciduous fruits in abundance and variety. At this writing there are, it is reported, from 1000 to 1200 cars of oranges in dealers' houses unsold as against between 250 and 300 cars at this time last year. The prospect of any sudden material improvement in the market situation is not bright.

There are in the neighborhood of 5000 cars of Valencia still to be marketed. Sales are being closed on a \$4@ \$4.50 f. o. b. basis for fancy. Valencia range from \$3 to \$6 in the Eastern markets.

Lemons are selling on a basis of \$6 per box f. o. b. for prime stock; in the Eastern markets from \$2.85@ \$7.25. Poor

grades are selling for what they will bring. Dealers are disinclined to load up with stock under existing conditions of price and weather, which are very uncertain. Pickings in the lemon groves are reported to be light, with a marked shortage of stock in sight next month. On the whole, however, the lemon shipments of this reason will be the largest in the history of the lemon growing industry in California, and will approximate 10,000 cars.

The shipments of citrus fruits for this year to date, according to the latest available figures supplied by the California Fruit Growers' Exchange, are: Oranges 30,282 carloads; lemons 8641 carloads. At this time last year the shipments were: Oranges 12,902 carloads; lemons, 4901 carloads.

RICE.

Investigation into the causes of the high cost of living has made the rice market quieter. No charges of hoarding can be lodged against the rice men, it is asserted, as there are no stocks in the State. The only trading being done at present is in futures. For spot rice, Choice California Japan is quoted at \$11.85 and the fancy at \$12.25. For futures on the same types the quotations are \$11.00 and \$11.25.

HONEY.

Some local demand for honey has developed, but very little stock is arriving here. Water white is unchanged and offering for amber and light amber have increased about 2 cents a pound. Water White Orange Blossom. .18@20c White to water-white sage (subject to production) .18@20c Amber Mountain (Sage-Buckwheat) 16@18c Light Amber Alfalfa .14@15

At the Fair

'Chain'

The thousands of cars parked at every big fair plainly indicate their important place in rural life.

They have become as necessary as telephones — *almost* as indispensable as binders, plows or harrows.

And because the dependable and economical operation of your car hinges so largely on tires, it pays to equip it with good tires —

— tires you *know* are good.

By the same token, it's good business to buy tires that are *exactly* suited to *your* car and *your* individual driving conditions.

There are five types of United States Tires — one for every 'need.

They're all good — all recognized leaders in their respective classes. All are built to give the utmost in service — to last and last and keep on lasting.

All contain the great strength developed by the long experience and extensive manufacturing facilities of the largest rubber company in the world.

It makes no difference what your driving conditions may be, the nearest United States Tire Sales and Service Depot Dealer can supply you with good tires that will *exactly* meet your needs.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

AUGUST 23, 1919

LOS ANGELES

Livestock, the Balance Wheel of Farming.

Written for Pacific Rural Press by R. H. Whitten.

Jim Marshall sold his farm for \$3,200 and gave up in disgust. For ten years the poor fellow had failed to make a living from his 80 acres. A long time ago he had raised good crops and made good money, but of late years the land hadn't produced well, although he couldn't see any reason for the change. The new owner, however, was a scientific farmer. He immediately put on beef cattle and fed all the crops to them. The very first year he increased the fertility of the soil so much that the next season he got the whole purchase price back. And he has been making good money ever since.

Jim Marshall has his counterpart in hundreds of California farmers. As one authority puts it, California land owners, as a rule, have not been real farmers. They have spent the natural richness of their farms like prodigals. They have robbed their lands to produce crops that have been shipped away, and thus have lost the fertilizer and the feed in the by-products. They have not fostered methods of farming or marketing that would conserve fertility, but have lived from the fat of the land until many of their farms have lost their virgin fertility and are merely skeletons of the rich fields they once were.

"There is no such thing as good farming without the keeping of livestock," said the late Jas. J. Hill, the builder of the great Northwest empire. "No lever will do so much to raise the farming industry to its highest level as the union of livestock raising with general farming. When our farmers make this combination they will be less at the mercy of the accidents of seasons and the variations of markets, and their added profits will be measured by the millions. Reports from all sections where agriculture has moved in this direction not only prove the assertion, but show astonishing results."

That's the gospel truth. Tilling the soil alone has never proved to be of long standing. In every country where that custom has been practiced the ultimate result has been famine and failure. For proof it is only necessary to refer to the famine-stricken areas of Russia, China and India. On the other hand, the profitable result of systems of livestock raising on even the poorest soil is to be seen in Holland. Denmark is another example of a country whose soils were becoming depleted by wheat producing, but where a system of livestock production conserved the fertility of the soil.

Here in this country, from the New England States westward to the Dakotas we see a trail of once depleted soils reclaimed by substituting dairying and stock raising for exclusive grain farming. A survey by the Department of Agriculture shows that a selected list of crop farms in the Middle West gave an average net profit of only \$28, while a similar list of farms in the same localities where livestock was kept showed an average profit for \$775.

To cite an individual case, a farmer in Illinois who kept livestock had a crop of corn last fall averaging 65 bushels to the acre. His neighbor across the road, who had no livestock, obtained a yield of 35 bushels. It was quite dry in that part of Illinois last year and the lands that had been cropped to death suffered severely from lack of moisture. A soil poor in organic matter cannot hold much

moisture, while one well stocked with organic matter retains it with great tenacity. The stockman's land had been given a coat of manure every three years; that of the other farmer had not received even one coat in twenty years. The result now is that not only does the stockman get better crops, but his land is worth \$225 per acre, while his neighbor's would not bring over \$175.

Builds a Soil Reserve.

It is argued that a bushel of grain will feed more people in the form of grain than after it has been converted

without you give it somethin' to eat."

The fact is that if we increase our livestock production by one-half, we will raise just as much grain for human consumption as we do now, because of the increased fertility of the soil. And even if we get no more for our crops in the form of meat and livestock products than we would if we sold them direct as grain, it will pay us to stock our farms and market grain and forage crops on four feet, because of the fertility that will be put back into the soil.

Too many farmers do not appreciate

For the prosperity of a country there must be a soil reserve as well as a bank reserve. The farmer who carries livestock on his lands, as in the upper picture, will find stored-up richness in the soil every time he plows, and will be able to raise bumper crops.

into pork, beef, mutton or some livestock product. True, but why think only of today? No country can become richer than its lands. From the soil come our food and clothing, and all other human needs are secondary to these. The prosperity of our nation depends upon the maintenance of our soil fertility, and we must work for the future as well as the present. We must create a soil reserve as well as a bank reserve. We should get good crops this year, but should leave the soil in such condition that it will produce even greater crops next year. Unless this is done our nation is bound to go backward. If we don't put back something to take the place of what we take out of the soil, it won't be long before there will be nothing to take out. Or, as the cross-roads oracle says: "No land'll stay fat long

the vast amount of fertility they sell with farm crops. A ton of alfalfa hay takes with it approximately \$14 worth of fertility; a ton of barley about \$10 worth; a ton of corn \$8.60, while a ton of butter takes but 64 cents worth and a ton of milk \$2.56. A ton of beef, selling for 11 times as much as a ton of corn, takes with it only one-eighth as much fertility, and a mature animal putting on fat takes away practically no fertility.

As the average dairyman feeds, the amount of feed required to produce \$100 worth of butterfat, if sold direct would bring only \$80, and \$26.17 worth of fertilizer would go with it. But if fed to dairy cows, not only would it bring \$20 more, but it would dispose of only about 11 cents worth of fertility. Dairy cows and other kinds of livestock have been appreciated in the

past for their milk, meat, hides and wool, but the value of their manure has not been taken into consideration.

Manure is coming to be a farm crop with a cash value. If you don't believe this, look up the experience of the citrus growers of Southern California who were compelled to go all the way to Idaho and Montana for manure to maintain their orchards in a profitable state of fertility. It's a long, long haul, and while manure from these distant States may help the citrus growers out temporarily, the time will come when they and other fruit growers will solve the problem by carrying livestock on their own lands; in fact, many are already doing it.

The most successful horticulturists have found out that an unbalanced agriculture is a big handicap; that specialization can be overdone, and that fruit and livestock are a rational and a business combination. The fruit raiser who, in addition to his specialty has, say a few cows, hogs and chickens, not only possesses an additional source of income but improves the fertility in the cheapest possible way. The cover crops now so generally grown in orchards afford a large amount of valuable feed for livestock, and are too valuable to be turned under. By feeding them to livestock the greater part of their soil-building value will still go to enrich the land, and at the same time a considerable profit will be made from the livestock, especially if registered stock is kept. Better yet, with richer soil will come increased yields from the trees.

Provides Market for By-Products.

We said a while back that a bushel of grain will feed more people in the form of grain than when converted into meat or milk, but not all crops raised on the farm are fit for human consumption, and even those that are have their by-products. In the manufacture of cereals and other seeds into flour, breakfast foods, hominy and vegetable oils, immense quantities of by-products are produced which are unsuitable for human food, yet are among the most valuable feeds for stock. Cottonseed meal and linseed oil meal are used extensively with profitable results. Mill by-products are fed to nearly all kinds of livestock.

Coarse roughages which have little or no commercial value can be turned into high-priced meat. Such feeds as straw, corn stover and silage in rations reduce the feeding cost greatly; the same may be said of beet tops, beet pulp and many other by-products. They cannot be eliminated because they are a necessary part of crop production. They have no value for direct human consumption, but when fed to livestock are converted into most palatable and nourishing morsels.

One great law of food conservation is to turn inedible feeds into edible foods. The misuse of the by-products of farm crops has caused a loss of millions of dollars annually, and nothing offers greater opportunity for increased and more economical production of farm meats and dairy products than the more efficient use of these by-products which heretofore have been wasted.

Safety in Diversification.

Again, diversification takes the risk out of farming. We cannot buy insurance against loss in farming, but (Continued on page 253.)

Auctions Solve the Selling Problem.

Written for Pacific Rural Press by R. H. Whitten.

A year ago last winter the call of the land reached the ears of Bert Potter, a young musician back in Illinois. He concluded that there was as much music in the squeal of a pig as in the wail of an organ, so he rented a farm and decided to make a start with pure-bred hogs. He went to a public sale and staked nearly all of his pile on a gilt bred to one of the greatest boars of the breed. She was an untried gilt and his neighbors thought he had gone plumb crazy to pay the world record price of \$1,500 for such an uncertainty.

The story was printed in the farm papers of that section, and when the gilt farrowed eight pigs, seven of which lived, people came from far and wide to see the litter. They pronounced it a remarkable one, and one breeder offered the price of the sow for three of the pigs. Potter turned the offer down, and again the neighbors pronounced him a fit subject for a padded cell.

The next fall Potter advertised a sale for November, featuring this litter. Everybody was there, and the bids came thick and fast. The first pig sold for \$1,500, thus practically replacing the original investment. And when the sale was over the seven pigs had sold for \$5,910—the world record price for a litter of that breed. Thus, the public sale method gave Bert Potter the right start, and it enabled him to sell his stock to the best advantage after he got started.

Public Sales Establish Values.

There are many Bert Potters starting in with livestock every year, and the public sale affords one of the best ways of investing their money to good advantage. Most of them know little about the fine points of cattle, hogs or whatever they are buying, and if one of them was offered a dairy cow for \$600 at private sale he would not know whether the animal represented good value or not. But put that same cow in the sales ring and her true value would be established. Men of keen judgment would bid on her, and if they bid to \$575 it would be pretty safe for the beginner to raise them \$25 and take her for \$600. He could well afford to pay the \$25 for the expert opinion of the other bidders. The price then would not be the result of his own judgment, but of the combined judgment of all participating in the bidding.

Furthermore, the beginner would be pretty sure that he was buying from a responsible breeder, for at auction sales the public can place its stamp of approval or disapproval on the business methods of the breeder. Instances of where these methods have failed of public approval have occurred often enough to leave no doubt of the merits of the public sale in this respect, and as a means of establishing true value of animals and eliminating bad business practices it seems to be the best plan that human ingenuity has yet invented.

Then again, the public sale provides a quick, convenient and cheap way for a man to buy stock. Years ago it was necessary to drive hundreds of miles and spend days—perhaps weeks—in visiting different farms where stock was offered for sale. Perhaps a few "diamonds in the rough" were picked up in some farmer's barnyard, but generally at so great an expenditure of time and gasoline that they really cost just as much as similar animals could have been bought for in the sales ring, and besides there was no publicity with the transaction.

Stimulates Desire for Purebreds.

Public sales are a splendid means of demonstrating to farmers that the purebred is not a myth or a plaything, but a real money-making animal. The man who raises scrubs cannot help but see the difference in what is before him in the ring and what he raises at home, and he notices in the bidding that men pay a premium for quality. He sees animals sell for several times what he gets for his own, and he knows that it has taken very little more feedstuff than he has poured into his scrubs. He sees that

the premium is paid for breeding, and he is soon convinced that purebreds are for him.

At each sale of registered stock from a half-dozen to a dozen new breeders are started. Few receive their first inspiration at the sale at which they make their first purchase. They have been attending sales for months, and the purebred ideals and

salesmen. One of the most important phases of any business is the disposition of the surplus at a profit, but too many breeders cannot write an order-bringing letter, or cannot put up a good sales talk if a prospective buyer calls.

The public sales method solves the problem for such breeders. It enables them to sell their surplus without the

of a lot of breeders at his ranch to see his place, to look over his foundation stock, to examine into his system of management, to learn how he is feeding and handling his animals, is a method of advertising that cannot be equalled in any other way. The man whose place is kept right, whose foundation animals are right, whose system of management is right, and whose offering in the sales ring is right, need have no worry as to the outcome of the inspection by his fellow breeders. The success of his sale will be assured. The animals will sell well, and the buyers will return to future sales and will bring their neighbors with them. They will tell about his ranch and his stock wherever they go, and will do much to put him on the map. For after all, the friends that one may make in the purebred business are of more lasting value than dollars that he gathers in.

Progress in California.

The public sales business here on the Coast is in its infancy, but as the purebred industry develops the public sale is bound to prove the solution of the problem of distribution. In fact, it is already doing it. For the months of September, October and December twelve sales are announced, and probably several more will be added to the list. There are sales by individuals, by groups of individuals and by breed associations. In all cases the breeders are well and favorably known; they have established herds of popular blood lines; they are to consign choice individuals from their herds. The auctioneers selected are men of honor and ability, fully conversant with their tasks, and these sales should be liberally supported by California farmers. Established breeders, beginners and all farmers who can possibly work livestock into their scheme of farming, should plan to attend. Even if they do not buy, they will be well repaid for the trip.

California breeders, following the Middle West custom, are beginning to provide places on their ranches for holding public sales. The above shows the natural amphitheater at the Ortega Underhill Rancho, Santa Barbara, in which a sales-ring has been built and numerous conveniences provided for both buyers and seller. Photo taken at the recent successful Hampshire sale, Col. Ord L. Leachman of Sacramento in the box.

possibilities have been brought to their minds so many times that finally they have decided to embark in the business.

Clearinghouse for Experienced Breeders.

Successful breeders gain much from attending public sales. Often a breeder will attend many sales without making a purchase, yet it is worth hundreds of dollars to him to view the different animals that are led into the ring, study their breeding, type and individuality, and compare his estimate of their value with the prices they bring. He can see if the type he is breeding is what the buyers want; he can form new acquaintances which may lead to business later on; he can meet other breeders, swap experiences and gain many valuable pointers.

Commenting on the value of public sales to both young and old breeders, Dean Curtiss, of the Iowa Agricultural College, says: "Next to the show ring public sales are the best means of educating the public to higher standards of excellence. Probably they even surpass the show as a stimulant to own better stock. There is a keen, practical interest in watching the buyers measure the value of the animals offered. Some of the most practical and successful breeders have gotten a large part of their schooling at the sales ring; in fact, many of them were enlisted at the sales ring, and but for the stimulus of this environment their interest would not have been aroused. The public sale has much to commend it, and individual breeders and breed associations may well calculate the advertising, the stimulating and the educational values of the public sale in promoting breed interests."

Puts a Breed to the Front.

Yes, that is another important feature of the public sale, and its proof is found in the fact that the breeds that are forging ahead in public favor are the breeds that hold the most sales. An editorial in a recent issue of one of the swine journals deplored the fact that the breed it championed was not so popular as some of the others, and attributed it to the lack of public sales, and consequently the lack of publicity which goes with them. Through public sales a breed gets more real publicity than in any other way, as the breed is brought directly to the eye of the public and to the farmer.

Best Method for the Breeder.

There are too many breeders of livestock who overlook the importance of a selling method. There are too many who are good breeders, but not good

necessary correspondence of private sales; the entire lot of stock is converted into cash in a single day at a maximum figure and at a minimum expense; a wider distribution of the stock is made, so that the advertising value is greater.

The successful breeder should look upon the public sale as an essential part of his business program. There is no better means of getting before the public what he is doing and how he is doing it. The coming together

M. BASSETT

HANFORD, CALIFORNIA

YOU CAN'T AFFORD TO MISS THE STATE FAIR.

The biggest ever—that's what we offer you this year. The wonderful new \$300,000 exposition building is completed. It is 485 feet long and 105 feet wide, and every inch will be occupied by interesting exhibits. The livestock barn will be filled to capacity, and the quality of stock will be better than ever. The tractor, truck and farm machinery departments will cover the biggest part of an 8-acre field.

The educational building will have a large and interesting exhibit from schools throughout the state. The woman's building will have a fine display of art and will house the "Better Baby" feature.

Restaurants and cafeterias are being arranged so that there will be plenty of places to eat at reasonable prices. There will be many entertainments features—a little of everything to please all kinds of people. There won't be an idle moment during the entire eleven days. Come expecting the time of your life. You'll have it.

CHAS. W. PAINE, Secretary.

Grazing on National Forest Ranges

The great livestock industry of the West is so largely dependent on the grazing lands within the National Forests that the right management of these lands is of importance to everyone who eats beef or mutton, or wears shoes and woolen garments.

During the last fourteen years the Forest Service has been working steadily to increase the country's supply of meat, wool and hides by developing methods of handling stock on the range which will allow as large an increase as possible in the number of sheep and cattle grazed without injury to the Forests, and a recent Government bulletin, "Range Management on the National Forests," gives the result of long experience in range management. With this bulletin as a guide, grazing can be made more uniform on different ranges, and the best principles can be put into actual practice.

Classification of the range to determine the areas best suited to the different classes of stock is the first important step toward the best use of the grazing resource. Cattle and horses use a different sort of range from sheep. Sheep relish tender, green foliage and the grains of many grasses, while cattle consume the coarse grass foliage. Cattle prefer level or rolling country, and altitude makes little difference if the stock have been raised on the range. Sheep do best on smooth range and where the summers are cool. They can go from several days to several weeks without drinking, depending upon the abundance of succulent weed forage, the temperature and the amount of rain and dew. Cattle need water oftener—at least every two days.

Overgrazing is a cause of injury to the range which must be carefully guarded against. In the past it has been difficult to know when a range was overgrazed until the damage was considerable. Extensive experiments by the Forest Service have led to the discovery of a means of detecting overgrazing before it has progressed very far. Certain "earmarks" appear in the vegetation, such as the predominance of annual weeds and grasses, like knotweed, tarweed, and mustard, with a dense stand of such species and lack of variety in species; the predominance of plants which have little or no value for any class of stock; and the presence of dead and

partly dead stumps or shrubs. Noticeable damage to tree reproduction and erosion and barrenness have long been recognized as signs of an advanced stage of overgrazing.

Establishment of grazing periods to prevent damage to the range through premature use has had as much to do with range improvement on the National Forests as the prevention of overgrazing, if not more. The repeated removal of herbage year after year during the early part of its growing season causes rapid deterioration of the range. Little damage is done after the plants have matured seed, but it is not practicable to allow all of the range to go ungrazed until after the seed matures. The problem is to work out seasonal grazing which will result in the maximum production of forage and livestock year after year. The usual way of doing this is to divide the range into several parts and begin grazing early on a different portion each year for a series of years.

The practical information necessary in carrying out the various principles that govern range management is given in detail in the bulletin. Suggestions are made regarding watering, salting, herding, the establishment of drift fences, the eradication of poisonous plants, the protection of wild life, stock driveways, breeds of stock, lambing grounds, and the proper care of ewes and young lambs.

HEREFORD NOTES.

H. M. Barngrover of Santa Clara, whose Veramont Stock Farm is at Taylorsville, Plumas county, has issued an attractive six-page circular telling about the farm and the Veramont Herefords. It is a classy little circular and everyone interested in beef cattle ought to have a copy.

Four prominent livestock breeders from Uruguay recently visited the United States and purchased for export to that country 21 Herefords, 14 Shorthorns and 6 Holsteins. Uruguay has been importing about 350 Herefords and 150 Shorthorn bulls from England each year and the visitors stated that after seeing American herds they believed the American cattle to be superior to the English-bred cattle. Gradually American purebreds will be in demand in all quarters of the globe.

Feeding Steers on Pasture

Written for Pacific Rural Press.

Does it pay to give supplementary feed to steers on pasture? An experiment along this line was recently conducted by the Department of Agriculture, and it was found that when cottonseed cake was fed to steers as a supplement to summer pasture it increased materially the rate of gains made by the animals, caused them to finish more quickly and take on a higher degree of finish and increased the margin between the buying and selling prices.

All of the experiments were carried out under actual and typical farm conditions. Consequently, the results may be applied directly to cases where steers are kept on pasture. In each experiment, groups of steers were kept on pasture alone; on pasture with a supplementary feed of one-half corn chop and one-half cottonseed cake; and on pasture with a supplementary feed of cottonseed cake. The average daily gains for each animal, which may be considered the most valuable standard in judging the efficiency of rations, were 1.49 pounds for the steers getting pasture only, 1.83 pounds for the steers getting cottonseed cake with pasture, and 1.53 pounds for those on pasture supplemented by the mixture of cake and corn chop.

The initial cost of the steers per 100 pounds of the three groups was the same for any one year, but in each case the steers on pasture alone sold for a lower price. The margins between the buying and selling prices of the cattle were always in favor of those which were fed supplements with their pastures. The margins averaged less than 25 cents a hundred pounds for the steers on pasture alone, compared to 90 cents for animals which were fed cottonseed cake with pasture, and 81½ cents for the animals whose pasture was supplemented with the mixture of cake and corn chop. After the animals had

been butchered, inspection showed that the steers which were fed cottonseed cake or a mixture of cake and corn with pasture dressed out higher than the cattle which had pasture alone.

While the steers that had pasture alone made gains cheaply, the total gains were not large, and the steers did not take on a high finish. Their unfinished condition is reflected in the small margin on which they were sold and low dressing percentages. Thus the profits they returned were smaller than for the steers in the other two groups.

The cost of gains of steers on pasture was greatly increased by feeding cottonseed cake, but the better market prices received for cake-fed cattle paid for the additional cost of feeding cake, and returned a greater average profit than is realized on the grass-fed cattle.

One of the distinct advantages on supplementing pastures for concentrates is the fact that steers so handled can be finished more quickly and can be marketed earlier than steers getting grass alone. Thus the cattle can be sold before the rush of grass-fed cattle glut the market and depresses prices. Moreover, when cattle are marketed early, the pastures have time to recuperate and furnish good grazing for other stock during the fall.

There is only one case where pasture alone is preferable to pasture with concentrates. Steers of inferior quality may return more profit by grazing alone than by grazing with the addition of supplementary feeds, especially when they are on good pastures that are cheap. Scrub steers do not respond readily to the use of good feeds, and even when well finished do not command satisfactory prices in competition with well-bred cattle similarly finished. The better the quality of the steers the safer it is to give them high-prices feeds.

Pacheco Shorthorns

For Profit

See Our Exhibit at the State Fair

We shall show a number of sons and daughters of our leading herd bull, **True Dale**; also a number of calves and a 2-year-old heifer sired by Pacheco Lad 58th, a son of True Dale. We believe these youngsters equal the product of True Dale himself, thus establishing the value of this great bull as a sire of bulls that will continue to sire good ones. Remember, he has never been defeated in the get-of-sire class.

When you want Shorthorns that make good, let us hear from you. We have 125 breeding matrons in our registered herd, representing the best blood lines of the breed.

Livestock, the Balance Wheel of Farming

(Continued from First Page.)

we can have just as safe insurance by diversifying. We hear a great deal nowadays about specialization—about putting all of our eggs into one basket—but in the long run the farmer who does this will scramble every egg he carries in his special basket. The successful farmer will have three or four sources of income—perhaps five or six, or even more. If the market is low on one thing that he has to sell it will be high on another, and the average will be satisfactory. And for the average farm, the greatest net profit will be obtained when from 50 to 75 per cent of the income is derived from livestock or livestock products.

Better Distribution of Labor.

A business is not economically operated unless it distributes labor over the entire year. For instance, a six-months' occupation might be considered profitable when estimated for that short period, while the same income spread out over a whole year might show an actual loss. Livestock production provides for the distribution of labor throughout the whole year instead of concentrating it at certain seasons. Help that is coming and going is not efficient or economical in farming, any more than it is in a mercantile business, and because the livestock farmer can offer steady employment he has comparatively little trouble in solving the labor problem.

Makes Better Farmers and Citizens.

Wherever you find good livestock you will find good farms, good citizens and good communities. Those early races that followed the pursuit of animal husbandry most systematically have played the leading part in the world's history. Modern breeders are likewise leaders in agricultural progress because their business has challenged the best in them and made them more efficient. As Prof. E. A. Trowbridge puts it: "Livestock of the right kind on the average farm makes for contentment, stability and satisfaction. It furnishes a means of interesting boys and girls, and tends to make farm life more attractive to them. It encourages reading and study and helps to develop admirable ideals—to keep one in touch with the rest of the world, and at the same time serves as a profit-producing occupation."

California Needs More Livestock.

We hear it prophesied that California will become the leading livestock state of the Union. That is not impossible, but she must go some first. At present Iowa leads all other states in beef cattle with 79.1 head per square mile, while California is fifteenth with only 12.8. New York

leads in dairy cattle with 32, while California is again fifteenth with only 3. In hogs, Iowa leads with 133.1, while California must be down among the tail-enders, as our list gives the 15 most important hog states and she is not mentioned. Ohio leads in sheep with 95.7 per square mile, and California comes in thirteenth with 16.4. In poultry Ohio also leads with 423.2 fowls per square mile, while California, even with her world-renowned Petaluma, Santa Cruz and Van Nuys districts, does not show up well enough to be mentioned.

True, we have lots of rough land, but that is an argument for more livestock. On land that is so rough or stony that it cannot be cropped economically, beef cattle will gather the grass on the smoother stretches and sheep will search out the herbage on the more inaccessible rocky slopes. Where the rainfall is light and irrigation is impossible, stock will thrive on the scanty, but highly nutritious, grasses and other forage. Through well planned systems of grazing, with additional feed during certain seasons of the year, our ranges should carry even more stock than they did before large areas were broken up into farms.

This, however, does not mean that livestock raising is adapted only to rough, cheap land, not suitable for crops. Up-to-date farmers no longer depend upon pastures alone to maintain livestock. It requires grain, hay, silage and other crops, as well as pasture, to make economical gains on animals, and these crops may be profitably grown on high-priced land. In fact, the high-priced land may not yield an income large enough to return a profit unless livestock is kept. As a rule it is livestock that gives high-priced land its value, just as it sets the value of many crops. Take corn, for instance. It is not the human consumption that determines its value. Over 80% of the country's corn crop is consumed for feed by animals on the farm. Livestock makes the value of corn—not corn the value of livestock—and lands devoted to corn-growing would never have attained their present high value without the development of the livestock industry.

California's greatest asset is agriculture, and the backbone of agriculture is livestock. Consequently, to have a permanently profitable form of agriculture we must have more livestock. Creative effort will bring no richer reward than when wisely applied to animal breeding. It alone will make our farms 100% efficient. It will make them the home of the American dollar.

TO INCREASE PURE-BRED BREEDERS.

The American Shorthorn Association has inaugurated a movement for every Shorthorn breeder to make it his business to start at least five new men with Shorthorns during the year. It would be unreasonable to expect every breeder to make good on this schedule, yet this is no reason why the movement is not a commendable one. Even if one breeder out of five reached the mark, it would mean a 100% increase.

This plan of the Shorthorn people is not copyrighted, and those who have other breeds are free to adopt it. It can be worked out just as well with other breeds of beef cattle; also with dairy cattle, hogs and sheep.

Not only is this movement a good plan in general, but it will prove of direct benefit to the man who does his part because it will establish new breeders of the same kind of stock right around him, and the more breeders there are in any locality, the better for each of them. Local pride and friendly rivalry mean better stock, better farmers, and better ranches. Also, when several farmers in a certain locality are breeding the same kind of stock, this attracts buyers to the community, as they think that their chances for securing what they want are better when they can

visit several breeding establishments in one trip.

HEAVY DEMAND FOR REGISTERED BEEF CATTLE.

"The demand for registered beef cattle is greater than ever before, with quite a number of new herds being started throughout the state," says T. T. Miller, the Shorthorn breeder of Hollister. In spite of the fact that marketing conditions are far from satisfactory, Mr. Miller says that pure-bred bulls are very much in demand for use in grade herds where they can accomplish great improvement. On the ranges the tendency is more than ever toward the use of pure-bred bulls and Mr. Miller believes that the only thing that prevents their general use is the fact that it has not been possible to secure as many bulls as are needed here in this state, and many cattlemen have not felt able to bring bulls out from the East. Pure-bred bulls used on average ranch cows will add from 150 to 200 pounds to the progeny at time of maturity, and besides, the type and quality of the offspring will be far above that sired by scrub bulls.

In California today, says Mr. Miller, there are herds of pure-bred cattle which will rank with the best of those in the East, and cattle of equal merit can be purchased on the Coast for much less than they can be purchased and shipped out from the East.

Carruthers Farms

LIVE OAK CALIFORNIA

SHORTHORNS

Home of the Champions. **COUNT GLORY**, for three years the Grand Champion of California and never defeated in the show ring. **HALL-WOOD VILLAGER**, first prize two-year-old at the 1918 State Fair and reserve Senior Champion to his stable mate.

At our recent public sale we established a new Coast Shorthorn sales average of \$820.

BERKSHIRES

The Berkshire is the hog that comes nearest to the pork-maker's ideal, and here you find the best of the breed. This herd is the fountain head from which many of California's leading herds have been established, and the two sales have topped the coast records; also the United States records for those years.

Headquarters for Good Stock

When you want money-making Shorthorns or Berkshires, follow the example of the wise breeders of the state and come to headquarters. You gain prestige by having Carruthers Farms stock in your herd. We can supply your needs for show animals, foundation stock, or new blood. Call and inspect stock, or write us your wants.

When you think of the Best in Reds, Whites and Roans, Think of Miller Shorthorns

T. T. Miller

Hollister,

California

Among the Beef Cattle Exhibitors

Written for Pacific Rural Press.

H. M. Barngrover, of Veramont Stock Farm, Santa Clara and Taylorsville, says that if any Hereford bull beats his herd sire, Patrician 5th, this year, he will have to be fed and groomed pretty well. Mr. Barngrover will show 12 head, including 2 cows, a two-year-old, 2 yearling heifers, 2 bull calves and a heifer; also aged herd and produce of dam.

T. T. Miller of Hollister will be missed from the show ring at the State Fair this year. Mr. Miller is in the east, so cannot show his good herd of Shorthorns. He expects to bring back a few cows with him.

J. A. Bunting, of Mission Hereford Farm, Mission San Jose, who has made such big cleanups at the State Fair during the past two years, will be on hand with 8 head, including the bull that was junior and grand champion last year. Watch him repeat his previous performance.

Pacheco Cattle Company, Hollister, who won 9 first and 3 second prizes at the State Fair last year, will make a fine showing of Holsteins again this year, including a number of sons and daughters of their great sire True Dale; also some youngsters sired by Pacheco Lad 58th, a son of True Dale. Mr. Hawkins is particularly proud of these youngsters, as they prove to him that True Dale is a sire of bulls that will continue to sire show stock.

Grainford Matchless, the first prize senior yearling at last year's International Livestock Show, recently purchased by Edward Cebrian of San Francisco, as one of the herd sires for his Caledonia Shorthorn ranch at West Sacramento, will not be in shape for the State Fair on account of the long trip across the continent and the hot weather experienced. However, Mr. Cebrian expects to have this great bull in shape for the San Francisco Show, and other breeders will anxiously await his presence in the show ring.

W. J. Bemmerly of Woodland can not show at Sacramento this year owing to shortage of labor. His stock, however, looks good enough to show most anywhere right now, particularly his 11-months-old calf by New Era 2nd that weighs 1150 pounds, and the Bonnie Brae Bull calf that is a very close second. He will be on deck for San Francisco with a great herd.

The Diamond G Ranch, H. H. Gable proprietor, have their cattle, both registered and range stuff in very fine shape—not too fat but just right. The registered herd is on wheat stubble, and it is seldom cattle dry fed look as good as this bunch. The range bunch are back on the hill pasture, but are in fine shape and look like purebreds. Too bad the registered stock cannot be shown, but shortage of labor prevents.

E. H. Murphy, of the firm of H. L. & E. H. Murphy, Shorthorn breeders of Perkins, is quite sick with typhoid fever instead of being in the east as was reported lately. His illness may prevent the exhibition of this firm's stock at the State Fair.

Roselawn Stock Farms of Woodland, Dr. H. M. Elberg, Prop., are not going to show their Shorthorns at the State Fair this year. Much disappointment is felt among Shorthorn men as it means a material shortening of the exhibit of this great breed to have this noted herd missing from the show ring.

T. S. Glide of Hillcrest Farm, Davis, is going to the State Fair with 12 head of Shorthorns that will make a very favorable impression. The condition of the herd is particularly good. His new imported herd bull, Scottish Lord, will not be shown.

The Estate of Thos. B. Dibblee will show 17 head of Shorthorns from Rancho San Julian at Lompoc and Santa Barbara. Mr. Troup certainly knows how to fit them in good shape.

G. W. Emmons of Oakland, owner of Diablo Stock Farm, Danville, will make his first exhibit at the State Fair with 11 head of Polled Herefords, selected from the fine animals he purchased at the Sacramento sale last spring.

Wm. Bond of Newark will be there with 7 head of Shorthorns, fit to win in hot competition.

BEEF CATTLE NOTES.

The Pacific Coast Hereford Cattle Breeders' Association will hold a banquet at the Travelers Hotel, Tuesday, September 2, and the genial secretary, J. A. Bunting, invites all breeders to attend. The association will have headquarters at the Hereford barn, at the State Fair, where breeders of Hereford cattle and their friends are invited to rest and talk over cattle. There will be literature on hand for free distribution to those who are interested in this great breed.

Shorthorns certainly are making rapid strides. In two years the number of herds in the United States has increased from 20,000 to 36,000. Furthermore, the selling price has raised from an average of \$399 in 1916 to \$514 in 1919. The indications are for even higher prices this fall. All of the breeders seem extremely prosperous.

Two train loads of prime steers recently shipped from Porterville to Kansas City brought better prices than could have been obtained at South San Francisco, considering freight differential and shrinkage. Secretary Stollery of the California Cattlemen's Association says the indications are that there will be a scarcity of fat range cattle at middle-west markets during August and September. The corn fed cattle will be out of the way and the market will be ready for California's best fat cattle at probably better prices than can be obtained locally.

R. M. Dunlap, the genial livestock broker, will make another Eastern trip some time this fall on a cattle buying trip.

Information has been received from Berkeley that on account of serious drouth and consequent scanty pasturage in certain states and counties of the great basin region, considerable amounts of feeder stock, cattle, sheep and hogs must be disposed of this summer and fall. Prof. C. W. Rubel, Agricultural Hall, Berkeley, can give information to persons desiring to secure car lots of feeder stock.

CALF RAISING PRECAUTIONS.

Don't overfeed. Twice as many calves are stunted by overfeeding as by underfeeding.

Don't feed milk in dirty, smelling pails.

Don't be irregular as to time of feeding or the amount of milk fed.

Don't vary the temperature of the milk. It should always be at body heat.

Don't change suddenly from whole to skim milk.

Don't let a calf drink foamy milk right from the separator.

Don't make a calf go without water just because it has had milk.

Don't deprive calves of salt. They need it constantly after two weeks old.

Don't let calves suck each other after drinking milk. They should be placed in stanchions and fed grain.

Don't start a calf on roughage with green alfalfa. It is too laxative. Use

dry hay for a few weeks, or preferably for the first two months.

Don't keep calves in damp, dark, crowded, poorly-ventilated barns or

sheds. The more they are made to rough it out in the open the better, provided they have protection from summer sun and winter storms.

CALEDONIA SHORTHORNS

Largest herd of high-class Shorthorns in this country—400 head of wonderful breeding matrons, combining the noted Elmendorf and Harkness herds.

The fountain-head of international prize-winning stock, producing the dam of the Grand Champion steer over all breeds at the 1917 Chicago International; the dam of the Grand Champion Shorthorn steer at the 1918 International; the dam of "CALIFORNIA MODEL," the highest priced Shorthorn bull ever sold on the Pacific Coast, bringing \$5,500 at public sale.

IMP. CALEDONIA

This great proven sire heads our herd. He is considered the best Scotch bull imported in recent years. Sired by the Duthie bull Proud Emblem, the best stock bull in Scotland, whose calf topped the sales last year at \$20,000. Out of a Rosewood cow—the best in the Wm. Anderson herd. In breeding, type, color and individuality this bull stands supreme.

Imp. Caledonia is assisted by GAINFORD MATCHLESS, first prize senior yearling at the last Chicago International, and PINE GROVE KING, a Clipper, by the champion King Cumberland, a proven sire.

Specialist in Registered Beef Cattle

I am a firm advocate of the use of better sires—Registered Bulls—reflecting through correct breeding a high standard of early development in weight, quality and finish, insuring most satisfactory results.

I devote my entire time keeping in touch with the Registered Beef Trade, much of it among the most expert and reliable Eastern breeders, which enables me to save time and other expenses when buying.

I will deliver at this end for less money than a stranger to the trade can buy at the other end, so let me quote you prices on Registered Beef Breeds Delivered.

I was born among Shorthorns and have been among Beef Cattle ever since. My thirty years' experience in California has shown me just what the State needs in

Registered Beef Cattle

and any one of the following list of a few of my customers—all experienced Beef men—will tell you I deliver the right kind:

MAYO NEWHALL, San Francisco
SIMON NEWMAN CO., Newman
H. H. GABLE, Esparto

Perkins, Sacramento Co., Cal.

Gigantic Fraud in Holstein Testing

Written for Pacific Rural Press.

Holstein breeders throughout the entire United States will be astounded to learn that Charles E. Cole, the man who has given world records to several cows, has made a complete sworn confession to the executive committee of the Holstein-Friesian Association, stating that his ability to make huge records lay in "helping" the cows by the direct addition of cream and water.

The method of "helping" used by Cole, according to his testimony as given in the Holstein-Friesian World, consisted of the direct application of cream, diluted with water to make a larger bulk. An ordinary hot-water bottle was suspended about his neck, the tube extending down inside his overalls and connecting with the pail through a slit in the crotch. A cork in the end of the tube held the mixture in place until the pail was nearly full, when it was removed, and the deed was done.

The proper surroundings for the successful use of this plan were stated to be a box-stall, with high tight sides, and only one window placed high and in the back right hand corner of the stall. The feed box was to be placed in that same corner, so that the cow would always be standing with her udder in the shadow, and where it would be impossible for the supervisor to stand on the opposite side of the cow. Fast milking and plenty of conversation for the supervisor furnished the rest of the natural setting.

Cole was detected in fraud in connection with the 51-pound record of Creampot Pontiac Korndyke, and in his confession he admitted that he had made some large fraudulent records, including those given cows in the Cabana herd recently dispersed. The matter is of a most serious nature, as it affects investments totalling hundreds of thousands of dollars.

President Aitken, of the Holstein-Friesian Association, has called a meeting of the executive committee for August 25 to act upon the matter and says: "We realize the tremendous influence that the action of the committee is bound to have, not alone on the animals whose records may be expunged, but the offspring that have been sold in practically all the states. Thousands and thousands of dollars have been paid for the offspring because of the record of the dam, and calves of the offspring have been sold at large prices because of the record of the granddam and the effect is already apparent in two or more generations.

"The committee realizes that the association is a record association; that the maintenance of the accuracy of these records are the reasons for its life, and that while the expunging of frauds from our records may bring disgrace, anxiety and loss to some of our breeders; the necessity for quick and accurate action is conceded by all. The only question in the mind of any officer or member of the Board of Directors is what does justice, equity and good conscience demand, and that action will be taken.

"The Herd Books of this great industry have been assaulted, and an insult and injury inflicted upon every breeder of the black and white wherever located, because in my opinion the man who has debauched our records has assaulted the good name and fame of the greatest breed of animals on the earth. There was no occasion for exaggeration, there was no occasion for fraud. The Holstein-Friesian cow has demonstrated herself on every occasion to be the most wonderful producer of milk and dairy products in existence, and this under legitimate and regular conditions."

The Way to Develop the Dairy Industry

Written for Pacific Rural Press.

Much has been said and written about the enormous increase in exports of dairy products during 1918, says M. D. Munn, president of the National Dairy Council. The amount exported during that year in the form of butter, cheese, condensed milk and milk powder showed a very large increase over pre-war exports. But government estimates show that it took only two and a half billion pounds of milk from which to make all the dairy products exported in 1918. This is only about 3 per cent of the milk produced in this country in 1918. If each person in the United States would increase the amount of milk he or she consumes each day by only two tablespoonfuls, it would amount to more than the entire amount exported in 1918.

It has been shown by thorough investigation that the following percentages of expenditure for food compose the diet of the average person:

Meat and fish	25 per cent
Milk and its products ..	20 per cent
Bread and cereals	15 per cent
Vegetables and fruit	13 per cent
Eggs	6 per cent
Sugar	5 per cent
Miscellaneous	6 per cent

LIBERAL FEEDING PAYS.

Generally it pays to feed livestock liberally, even if the immediate results do not seem to justify the additional expense.

With dairy cows, if the flow is allowed to decrease during the winter months it will not be possible to get as much milk during the green feed season as it would be if the flow was maintained. Habit has a great deal to do with the milk production, and as a rule it will be found that the best cows are the ones that were trained, as well as bred, to produce milk.

The wool of a sheep, in the hands of a professional buyer, tells a true story of the life conditions surround-

ing the sheep from which it was clipped. The time when feed was short registers itself in the ease with which the wool breaks, and the sheep well cared for registers its pleasing story in the oil in the wool.

Meat and fish 35 per cent
Milk and its products .. 44 per cent
Bread and cereals 13 per cent
Vegetables and fruit 17 per cent
Eggs 6 per cent
Sugar 3 per cent
Miscellaneous 5 per cent

Taking the conclusions of authorities as to the need of increased consumption of milk and its products in our diet, Mr. Munn says that it is far better for those engaged in the industry to build home consumption of these products by constructive publicity, instead of chasing any export "will o' the wisp." Our national and human welfare require this of those engaged in the dairy industry. We are glad to be able to state that California is doing her part. The California Dairy Council is carrying on an effective campaign to educate the public to the food value of dairy products and it is bound to result in a very large increased consumption in this state.

ing the sheep from which it was clipped. The time when feed was short registers itself in the ease with which the wool breaks, and the sheep well cared for registers its pleasing story in the oil in the wool.

The finely marbled piece of beef comes from the steer whose path has led through luxuriant places. And so it goes. Give the animal the best of feed and the best of profit will come back to you.

Dairy utensils should always be rinsed in cold or lukewarm water immediately after using them. Do not use hot water until the utensils have been thoroughly rinsed out with cold or lukewarm water. Never use rusty utensils.

Sunflowers for Silage

Written for Pacific Rural Press.

Not many people would associate sunflowers with butter, for, excepting some resemblance in color, there is apparently little connection between them. Yet sunflowers are playing an important role in the production of butter in many parts of America, and the number of inquiries we are receiving shows that Californians are becoming interested in this crop.

In Montana, where sunflowers have been raised for silage for several years, and where extensive feeding tests have been carried on, the sunflower has established itself as a profitable silage crop for dry-land conditions. It yields from 10 to 20 tons on dry land, and from 20 to 30 tons, green weight, under more humid conditions. Yields as high as 40 tons per acre have been made under irrigation. In the feeding tests the nutritive value of sunflower silage was shown to be equal to that of such corn silage as was produced in Montana; it proved just as palatable; the cows made as much butterfat, and the flavor of the butter was all that could be desired. The way the cows relished the sunflower silage was particularly noticeable. One dairyman said that when he began using it his cows "ate the bottom right out of the manger."

In Idaho, cows that had been fed corn silage were changed to sunflower silage and took to it readily. They ate it heartily and thrived on it just as well. The conclusion was that in sections where corn cannot be successfully grown for silage, sunflowers will prove a boon to dairymen on account of its heavy yield, its high feeding value (properly combined with other feeds), and the way cows relish it.

In some sections sunflowers have been used as a soiling crop, thus furnishing an abundance of feed during the fall months when there is often a shortage of pasture. Some dairymen fed the stalks whole; others preferred to cut them up. A farmer back in Michigan planted sunflowers with corn for silage, having about 25 per cent of the volume in sunflowers. He says: "I am agreeably disappointed in the way the cows eat this feed. I was apprehensive that the coarse stalks of the sunflowers would be left, but the cows nose the leaves of the corn and sunflowers away and search out the coarser parts, seeming to relish the stalks best. We began running this green stuff through the cutter and feeding it three weeks before starting to fill the silo and it has all been cleaned up from the first. Even the large butts, some of them two inches in diameter, when broken up in the cutter are readily eaten."

How to Raise.

The Mammoth Russian variety of sunflower is generally used. It produces large stalks, attains a height of 7 to 12 feet, and is not exacting as to soil requirements. It can be planted a little earlier than corn. Frost will

not injure the sunflowers readily, thus prolonging the harvesting season. A grain drill or a corn planter may be used for seeding if the proper adjustments are made.

Under irrigation two methods of growing the sunflowers have been tested—seeding them in drill and in check rows at different distances. The former method has proved more satisfactory. The most practical distance between rows has been found to be 24 to 30 inches and the amount of seed 12 to 16 pounds per acre. The desired distance between rows can be obtained by stopping a sufficient number of the seed cups of the grain drill.

Under dry-land conditions the best yields are to be expected by seeding the sunflowers in rows 36 to 42 inches apart, using five to seven pounds of seed per acre, and thinning the stand to one plant for every 10 or 15 inches of the row.

We have heard of several disappointments among farmers who merely planted the seed and gave the crop no attention. Sunflowers must be cultivated just like any other crop to get the heaviest yield; otherwise it will be a case of time and money wasted.

Methods of Cutting.

Sunflowers are cut for silage when one-half to three-quarters of the seed is in the milk stage. If cut before this time the stalks are watery and considerable loss in weight occurs. If more matured, the feed is less palatable and probably some of the leaves will have been shed. The harvesting may be done by hand or with a corn binder. Some difficulty may be experienced with the binder if the sunflowers are lodged. Both the heads and the stalks are utilized. They are passed through the silage cutter and placed in the silo in the same manner as corn.

Feeding Value.

Sunflower silage is fed in the same kind of a combination with other feeds as corn silage, and not more than 40 pounds per cow should be fed daily. Henry's "Feeds and Feeding" gives the following as the number of pounds of digestible nutrients found in 100 pounds of these two fodders:

	Protein	Carbohydrates	Fat
Green sunflowers ..	2.2	10.7	1.3
Green corn fodder ..	1.0	12.8	0.4

These analyses would indicate a decidedly higher feeding value for green sunflowers than for corn fodder, but feeding experiments at the Montana Experiment Station do not seem to warrant this conclusion, as the values were shown to be about the same.

To what extent sunflowers will replace corn as a silage crop no one can say, but it is beyond the experimental stage as a successful crop in sections where corn cannot be successfully grown. If we were to venture advice it would be: Grow corn for silage if you can do it successfully; if not, grow sunflowers.

The Greatest Holstein

Blood Combination in the West

PRINCE RIVERSIDE WALKER

Our senior herd sire, PRINCE RIVERSIDE WALKER, is out of the same dam as Aggie Acme of Riverside 2nd, the wonderful cow who has just made a yearly record of 1,053 lbs. butter from 20,354 lbs. milk at 12 years of age, and who made the world's highest official yearly butter record for 1917-1918. Also he is by the same sire as Miss Valley Mead De Kol Walker, the junior 3-year-old making the highest yearly butter record for 1917-1918.

Two Bulls of Unsurpassed Breeding

Our junior herd sire, KING KORNDYKE PONTIAC 20TH, is the highest priced bull ever sold at a California public sale. He is by King Korndyke Pontiac, the best son of King of the Pontiacs in the West, and out of Miss Valley Mead De Kol Walker, who made over 36 lbs. butter in 7 days and 1100 lbs. in one year as a heifer. She is a daughter of Prince Geische Walker and of De Kol of Valley Mead 2nd, former world record 2-year-old.

KING KORNDYKE PONTIAC 20TH.

The Herd of Heavy Producers

We now have 8 cows with records over 30 lbs., and the list is constantly growing. The calves by King Korndyke Pontiac 20th, mostly out of cows by Prince Riverside Walker, are the most remarkable lot you ever saw. They show great quality and wonderful udder development, and promise to develop into world beaters.

Keep your eye on this breeding and make your mind to have a bull of this wonderful conformation. Entire herd tuberculin tested.

SURE CURE FOR PIG SCOURS.

A veteran hog raiser, who has been at the game for over twenty years, says that he has never known the following remedy to fail in curing scours, and in nine cases out of ten a cure will be effected within 24 hours.

It consists simply in using real strong coffee. Put four large tablespoons of ground coffee in one-half gallon of water and let boil five to ten minutes. Mix this in the sow's slop and give to her night and morning until the scours in the pigs are checked. Generally not more than three or four feeds will be required. If the trouble was caused by over-feeding, cut the feed down until conditions are normal again. If caused by damp quarters, move the sow and litter to a dry bed.

This remedy works equally well with calves and colts, but should be used as a drench instead of being fed through the milk of the dam.

THE "QUITTER" HOG.

The "quitter" hog is known by old-time breeders as the one that takes on fat quickly and stops growing early. We hear a great deal nowadays about the advisability of early maturity, but we really don't want breeders to mature early. We want them to grow fast, but we also want them to keep on growing and not ripen at an early age. The pig that, instead of developing and growing, fattens, cuts off further usefulness.

When you find one of your hogs that fattens quickly does not have the stretch of body, nor the depth, nor well-sprung ribs, and carries a great deal of surplus fat; stands on short legs, with the hams coming down well on the hocks; has a short head and a thick jaw, he is a finished hog, and if he is not large for his age you may class him as a quitter. He will never become large, and is undesirable to use as a breeder. He should be sold for pork and should be banished from the breeding herd.

Dirty Milking Machines Unsafe

Written for Pacific Rural Press.

Some dairymen say that it is not easy to produce clean milk in summer when milking machines are used on account of the difficulty of keeping the rubber parts of the machine free from germ growth. But if the following treatment is used it will not be found a difficult task, neither will it be necessary to buy expensive germicides, as the old-fashioned chloride of lime will serve every purpose. This is made as follows:

Stock Solution: Dissolve a 12-ounce can of chloride of lime (calcium hypochloride) in 3 quarts of water; let settle, pour off the clear liquid, and put in it a jug or dark bottle and keep tightly corked.

Working Solution: Add one pint of stock solution to 100 gallons of water or one-half pint to 50 gallons, or smaller amounts in proportion. This should be kept "alive" by the addition daily of stock solution at the rate of about one ounce to each 25 gallons

of the working solution.

How to Use: Immediately after milking and while the machine is still running, suck through the machine 3 pails of water—the first clean cold water, the second hot soda water, and the third clean hot water. Then detach the teat cups and rubber tubes and plunge them in this working solution so that they are entirely covered. See that all pockets of air in the tube are emptied so that the water will come into gradual contact with the walls of the rubber. Keep in this solution until the next milking; rinse with clean cold water before using. Once a week clean all rubber parts thoroughly with brushes.

To sterilize milk bottles, pails and cans, the same working solution may be employed and will be found generally more effective than the hot water method commonly used.

The milking machine is a great help or a great hindrance to quality. It all depends on how it is handled.

STATE FAIR OFFERS MANY PRIZES FOR DAIRY PRODUCTS.

The California State Fair is offering medals and cash prizes amounting to \$1,000 for exhibits of creamery butter, cheese, market milk and cream sent to the State Fair this year. Special prizes are also given to milk dealers and dairy inspectors. Milk and cream exhibits, consisting of 4 pint bottles of milk or 4 half-pint bottles of cream must be shipped on August 25 and sent express prepaid to Director in Charge of Dairy Exhibits, Consumers Ice and Cold Storage Company, Sacramento. The butter and cheese exhibits must be shipped express prepaid to Director in charge of Dairy Exhibits, Dairy Building, State Fair Grounds, Sacramento, and must arrive by 6 P. M., August 29th. All exhibits should be carefully packed to withstand warm weather, and the milk, cream and

butter exhibits should be packed in ice for shipment.

Three cash prizes on judging dairy products amounting to \$150. The money in this class shall apply on scholarships in the Dairy Manufacturers' Short Course at the University Farm, to be paid to the winner upon completion of the course. Premium lists and application blanks for milk and cream exhibits can be secured by writing to Secretary, State Agricultural Society, Sacramento, California.

Cows holding up milk should have their udders massaged before commencing to milk. It is also a good plan to let them eat something they especially like while being milked.

Only the rich can afford to keep poor cows. But they don't, and that's one reason why they are rich.

...Packwood Farm Holsteins...

A herd bred for type, constitutional vigor and heavy production. Best blood lines of the breed. Official testing constantly carried on.

The Home of King Abbekerk Johanna Segis

The sensational young bull we purchased at the last Guaranty sale for \$5,000. He is by the great Bridgford bull, King Segis Alcartra Abbekerk, and out of the 41-lb. cow Adirondac Wietske Dairy Maid, holder of the Pacific Coast records for 7, 30 and 60 days for both milk and butter, and the 30 and 60-day United States records for combined milk and butter.

A Guarantee of Success

There is not a weak link in the chain of this bull's ancestry, and his rich breeding means 100 per cent efficiency for his offspring. He is being used on daughters of Prince Hiske Walker and Segis Pontiac Crane De Kol, and the dairyman who buys stock of this breeding will have the best possible guarantee of success.

Write or Call When You Want Good Stock.

W. F. Mitchell, Owner, Visalia, Cal.

Here He Is

The royally bred young bull we purchased at the Cabana sale to cross with our matchless daughters of King Pontiac Segis Korndyke.

Notice his grand type. Then study his wonderful breeding given below, and you will understand why he must sire great producers.

Pioneer Pride --- Highest Record Calf in California

His Sire: FINDERNE PRIDE JOHANNA KORNDYKE, a grand young son of our senior herd sire, King Pontiac Segis Korndyke. Dam, Finderne Pride Johanna Rue, the only cow that ever made two 7-day butter records, each above 36 pounds, in one lactation period. Eleven months after freshening she produced 36.03 pounds butter—the world's record over all ages and breeds. For the full year she produced 1470.59 butter, world's record at the time, and only surpassed by one cow since then. She has a 31.95 pound 3-year-old daughter and 3 A. R. sons.

His Dam: PIONEER BESSIE, the phenomenal young cow that completed a 7-day record of 41.20 pounds butter from 713.7 pounds milk under the most unfavorable circumstances the night before she was sold at the Cabana sale, and was purchased by Chas. Cole for \$7,100. She is by Prince Hazel Korndyke, he by a brother of King Segis. The dam of her sire and the dam of the young bull's grandsire are sisters, both being by Pietertje Hengerveld's Count De Kol, with 99 A. R. O. daughters.

Destined to become California's Premier Sire

Keep your eye on this young bull. Watch him make Holstein history here in California. The daughters of our senior sire are noted for their size, individuality, constitutional vigor and udder development, plus their ability to produce in both short and long-time tests. The combination of these qualities, intensified by similar blood lines in Pioneer Pride and the Finderne Pride Johanna Rue cross, will enable us to offer a line of breeding that cannot be duplicated anywhere on the coast.

Dairy Cattle Exhibitors

Written for Pacific Rural Press.

The J. S. Gibson Co. of Williams expect to show 10 head of their Holsteins at the State Fair. Mr. Self will have them right on edge and will certainly make a fine showing.

Dr. H. W. Hand's Keep On Register of Merit herd of Jerseys will be represented at the State Fair by 12 head, filling most of the classes. His cattle are looking fine and with recent additions will make a fine showing. St. Maw's Susy's Olga, a recent addition to the Keep On herd, has a record of 698.51 pounds fat in one year and promises to do much better. A 4-months-old daughter of this cow was purchased by Hood Farm for \$1,550, which is a pretty good indication of what they think of the breeding.

J. A. Thorp of Lockeford will have 18 head of his beautiful herd of Jerseys on exhibition and is bringing them along in wonderfully fine condition, due largely to his personal supervision and work. His cattle certainly look as though the judge would have to give them some consideration before placing others ahead of them. Many of his cattle shown will be of his own breeding.

The Henderson Company of Sacramento have entered 20 head and will show several daughters of the great sire, King of the Black and Whites.

After viewing the dairy cattle at the State Fair don't fail to visit the exhibit of the California Hydraulic Engineering Supply Company and see the demonstration of the Universal Milking Machine; a complete exhibit of the Loudon Barn Equipment and Alamo Silent Farm lighting plant. It will be well worth a call.

J. H. Wherrell of Fuimus Farms, Riverside, is coming up from the South with a very fine lot of Jerseys and will make a strong bid for first honors.

L. D. Smith of Claremont Farm, Berkeley, will show a large herd of 19 Guernseys this year. His cows are heavy producers as well as show animals.

Walter Dupee of Edgemoor Farms, Santee, will have the largest herd of Guernseys on exhibition with 24 head entered. Until recently Mr. Dupee had the highest priced Guernsey bull in the United States and the females include some of the best animals of the breed. His competition with the northern breeders will be watched with interest.

J. Henry Myer of San Francisco, whose ranch is at Watsonville, will show 18 head of Ayrshires. While only a few breeders will show Ayrshires each one has a large herd and competition will be keen, but Mr. Myer should walk away with his share of the ribbons.

Thos. Harrison of Santa Rosa Stock Farm, Santa Rosa, has entered 13 head of his noted Milking Shorthorns. He has them in fine shape and expects to get his share of the ribbons.

Make yourself at home at the De Laval booth where you can look over the De Laval line of separators, barn equipment, feed cutters, and the new De Laval milker, which promises to prove such a sensation.

Bridgford Company, Knightsen, who

won a lion's share of the Holstein awards at last year's State Fair, will show 17 head this year in nearly all of the classes, including all the herd classes, get of sire and produce of dam. Breeders will be glad to learn that the world's champion, Nattaline Walker, will be shown in the 3-year-old class; also the state champion senior 4-year-old, Spring Farm Pontiac Maid 2nd, and the grand champion King Segis Alcartra Prilly. Most of the balance of the exhibit will be made up of the get of King Segis Alcartra Prilly, which will include 12 young bulls and heifers.

E. J. Kellerman, Modesto, will show 7 head of Holsteins, including 3 heifers and a bull calf sired by Sir Johanna De Kol Rag Apple, a son of the 41-pound Adirondac Wietske Dairy Maid.

J. S. Gibson Co., Williams, will not take in the entire circuit of shows this fall, but will have 10 head of Holsteins at Sacramento and Orland.

W. J. Hackett, Ceres, will make a fine showing at the State Fair with 8 head of Jerseys.

H. E. Cornwell of Modesto will show 5 head of Holsteins, including the great 41-pound herd sire, Sir Johanna De Kol Rag Apple.

Guy H. Miller, Modesto, will make his usual good showing of Jerseys, and his herd will include the grand champion bull Altama Interest.

J. E. Thorp, Lockeford, is starting out to win his share of the ribbons at the shows this fall and will have 18 head of Jerseys at the State Fair. He is particularly determined to win in the 5-cows-in-milk class.

W. J. Higdon of Tulare will make a wonderful showing with 18 head of Holsteins headed by his \$6,500 bull, King Korndyke Pontiac 20th. He will fill practically all classes and the herd will include the twin bull calves dropped at the State Fair last year by Model Bonnie Fobes, sired by Mutual Fobes Longfellow De Kol.

Alexander & Kellogg of Innisfail Farm, Suisun, will make their usual fine showing of dairy Shorthorns, and their herd of 17 head will include the great show bull Westward Ho. There will be 5 cows in milk, 2 entries for the best Record of Merit cow and also entries in the produce of dam and get of sire classes.

E. E. Greenough will be on hand with a good showing of Jerseys from his Sunshine Farm at Merced.

A. B. Humphrey of Grape Wild Farm, Escalon, will show a herd of Guernseys at the State Fair. Mr. Humphrey's Guernseys are too well known to need any comment. They win wherever they go.

N. H. Locke Company of Lockeford will be unable to make a showing of Jerseys this year on account of help troubles.

As usual the Holsteins head the list with the largest number of entries, there being 108 head entered.

The Yolo-Sacramento Cow Testing Association will give an educational exhibit to show dairymen how to cull out the less productive cows and will also exhibit desirable types of heavy producers.

HAVE SOME NICE YOUNG BULLS

Sired by SIR VEEMAN KORNDYKE PONTIAC

and from A. R. O. dams for sale.

ALSO A FEW CHOICE POLAND-CHINA BOARS.

R. F. GUERIN,

Visalia, Calif.

SEGIS PONTIAC De Kol BURKE

Heads my herd of A. R. O. cows with records up to 32.16 lbs. butter in 7 days. Look up his breeding and you will want some of his blood in your herd.

Breed for BUTTER FAT

The 20 Daughters of Dutchland Sir Pietertje Creamelle

in my herd are all high testers, averaging well over 4 per cent and they have records at two years or younger, averaging over 20 lbs.

Have for sale a few of his sons out of good producing cows, also bulls out of his daughters sired by KING KORNDYKE SADIE VALE.

F. Stenzel San Lorenzo - Calif.

Breeder of High Test Holsteins

Sir Pieterkje Ormsby

Mercedes

43rd

SENIOR HERD SIRE

HIS SIRE: SIR PIETERTJE ORMSBY MERCEDES, the greatest sire of yearly record daughters of any breed. Twenty of his daughters, most of them under mature age, average over 1,000 pounds butter in one year; two have records above 1,300 pounds butter in one year; eight have records above 1,000 pounds butter in one year; fourteen out of his 66 A. R. O. daughters have records above 30 pounds butter in 7 days; two have records above 40 pounds butter in 7 days.

Three of his daughters sold for over \$30,000 and one son sold for \$65,000 in the Minnesota Breeders' sale last June.

Production and show ring records establish him as the breed's premier sire of producers and show-ring winners.

HIS DAM: AAGGIE WAYNE PEEP, one of the outstanding cows of the breed.

Her records are:

Butter, one year	1,250.35 pounds	Butter, seven days	34.59 pounds
Milk, one year	27,762.50 pounds	Milk, seven days	657.20 pounds

SHE HAS PRODUCED IN FOUR YEARS:

Butter	3,999.43 pounds	AVERAGE)	Butter	999.85 pounds
Milk	88,509.70 pounds	PER YEAR)	Milk	22,127.40 pounds

She is a full sister to Early Dawn Peep 2nd, 1,287.72 pounds butter from 26,204.1 pounds milk in one year; and half-sister, by the same sire, to Ona Clothilde Wayne, 1,266.65 pounds butter from 27,091.5 pounds milk in one year, and Jennie De Kol Veeman Wayne, 1,003.21 pounds butter from 20,876.3 pounds milk in one year.

JUNIOR HERD SIRES

Sir Aaggie Mead

Sire, Sir Aaggie De Kol Acme. Dam, Aralia De Kol Mead.

His dam and sire's dam each have strictly official yearly records above 1,200 pounds, averaging 1,273.49 pounds, which can be said of no other bull.

His dam, dam's dam, and his sire's dam average 1,229.76 pounds—a world's record average.

His three nearest dams each have produced over 2,000 pounds butter in two consecutive years, averaging over 2,200 pounds, which can be said of no other bull.

Five of his seven nearest dams average 1,177 pounds butter in 1 year—a world record average. You can't beat this long distance ancestry.

Finderne Soldene Valdessa

Sire, King Valdessa. Dam, Finderne Soldene Hengerveld.

His sire is a son of the first 41-pound cow and a grandson of the first 44-pound cow.

His dam, a 35.34 pound three-year-old (world's record for heifer with first calf), is a daughter of King Hengerveld Aaggie Fayne, one-third of whose daughters have exceeded the 30-pound mark, and who is a brother to the 50-pound cow Segis Fayne Johanna.

His dam is a sister to the world's champion yearly producers of the junior three-year-old and junior two-year-old classes. Also a three-quarters sister to a 1,075-pound three-year-old.

The Health of Our Herd is Under State Supervision

We have over 200 head, including cows with yearly records up to over 1,100 pounds butter, and daughters of large yearly record cows. Also 10 cows and heifers with records above 30 pounds butter in 7 days, and a large number with records from 25 to 29 pounds butter in 7 days.

EVERY FEMALE IN THE HERD WILL BE GIVEN A 305 OR 365 DAY RECORD

Visitors cordially invited to the farm.

Stick to One Dairy Breed

Written for Pacific Rural Press.

Good bye, you cross-breed, bony scrub.
The times demand a better breed.
You eat enough, but there's the rub—
You never pay for half your feed.
So after all these years we part,
But pray remember as you go—
If this should break your bovine heart,
My purse was broken long ago.

Tom Marshall ran a dairy. For years he had proceeded on the theory that a bull was a bull, be he a scrub, grade or purebred, with the balance always in favor of the scrubs because they were cheap. In fact, he openly boasted that he placed no stock in this pure-bred sire idea. He liked to "mix 'em up."

Somehow he had gotten a number of grade Jersey, Holstein and Guernsey cows into his herd, and there was just about the same number of non-descripts of his own breeding. After much persuasion he was induced to join a cow testing association, and side by side in the same stable, getting the same care and treatment, were the grades and the scrubs.

As time passed on the monthly tests began to open Tom's eyes, and at the end of the year his theories were completely changed, and why shouldn't they be? For the yearly records showed that the grades had returned a net profit of \$48 each and the scrubs only \$37. It didn't cost any more to produce the grades than the scrubs. No better bulls were used. The only difference was that in the first case a bull of the same breed was used each time, and in the second case a bull of different breed.

Yet isn't the latter about what is done on the average farm? Over 75 per cent of the cows throughout the land are classified as common cows, meaning that they do not show enough of the characteristics of any one breed to be classed as grades of that breed. The herds indicate that the farmers change breeds about as often as they change sires. The reason often advanced is that when bulls of the same breed are used continuously the herd runs down in size and constitutional vigor.

Also, a farmer having a good grade herd of Jerseys observes a much larger yield of milk secured by a neighbor who has Holsteins, and he decides to make a Holstein cross, thinking that he can combine the richness of Jersey milk with the quantity of the Holstein. Occasionally this end is partially attained, but only in exceptional cases. The usual

result is that the offspring gives the quantity of the Jersey and the quality of the Holstein.

Dairy breeds have been developed for distinct purposes—some to produce a high per cent of fat, others to produce a large quantity, etc. And to cross distinct breeds is to defeat the very object for which the breeds have been developed. They have been kept pure in order for certain characteristics to become fixed so strongly that they will be transmitted regularly, and crossing breaks the chain of inheritance and makes it impossible to predict what the outcome will be—except that, as a rule, it will be a step backward. The cows will lose all breed characteristics, and the occasional good animal that appears from such a mixture will not transmit her good qualities.

A soldier firing at random accomplishes no more than the farmer who has no fixed aim in his breeding operations. The first step toward the goal of success in dairying is to decide upon an established breed. It doesn't make so much difference what breed is selected, but when a farmer once decides upon a breed he should stick to it. He should not allow anything to switch him over to another breed.

It isn't so hard to build up a profitable herd if this simple suggestion is followed. No matter how common the foundation cows, the persistent use of good purebred bulls of one breed will bring quick and certain reward. Three crosses will result in cows that are 87 per cent pure blood, and in both appearance and production they will resemble purebreds very closely.

So if you're a scrub,
Don't be a dense dub,
And conclude that there's nothing in cows.
Clean house; take the lead—
Buckle up; name the breed,
And your home will rest high in the boughs.

No one can tell how long a cow will continue in lactation, yet this is an important factor in determining her value. As a rule, one that starts off with a big flow and soon dries up is less profitable than the cow giving a fair yield for the year.

The first essential for the production of good milk is to have a clean barn. It should be well lighted and ventilated, and a coat of whitewash applied once or twice a year will add much to its appearance and wholesomeness.

Finderne Soldene Pontiac Valdessa

The Bull with the Backing

The names of 10 World's Record Cows appear in his Pedigree

FINDERNE HOLINGEN FAYNE—
Butter in 365 days at 3 yrs. old, 1395 lbs. World's 3-year-old record.
FINDERNE NETHERLAND FAYNE—
Butter in 365 days at 27 months old, 1200 lbs. World's record 2-yr-old.
(Will this record ever be excelled?)
LUTSCKE VALE CORNUCOPIA—
Milk in 365 days, 31246 lbs. World's record when made.
SEGIS FAYNE JOHANNA—
Butter in 7 days 50.68 lbs. World's record when made.
FANCHER FARM MAXIE—
Butter in 7 days at 4½ yrs. old, 46.84 lbs. World's record.
K. P. PONTIAC LASS—
Butter in 7 days, 44.18 lbs. World's record when made.
VALDESSA SCOTT 2D—
Butter in 7 days, 41.88 lbs. World's record when made.
FINDERNE SOLDENE HENGELVELD—
Butter in 7 days, 35.34 lbs. World's record for heifer with first calf.
GRACE FAYNE 2D HOMESTEAD—
Butter in 7 days, 35.55 lbs. World's record when made.
MABEL SEGIS KORNDYKE—
Butter in 7 days at 4 years old, 40.32 lbs. World's record.

We have his sons and daughters for sale, one to a car load; also some extra good young cows and promising heifers bred to him. 225 head to select from.

CAN YOU BEAT IT?

Does It Pay the Small Breeder to Test?

Written for Pacific Rural Press.

With three 50-pound cows and more than 50 above 40 pounds of butter in 7 days, it is not unnatural for the little breeder, who perhaps has never been able to break into the 25-pound class, to ask himself if it is worth while to go on and try to make records, says the Holstein-Friesian World.

It may seem a little discouraging to a breeder who knows he has good cows, and who has been testing a little off and on for a number of years, to realize that other breeders can make records from fifty to a hundred per cent larger. But is this a sufficient reason for dropping out of the testing work yourself? In the first place, it should be remembered that, even though those extreme producers get and are probably entitled to the lion's share of the publicity, numerically they represent but a small proportion of the breed. It is the average for the whole number that denotes progress, and the constant raising of the average production for the Holstein is the thing that should be the greatest cause for satisfaction upon the part of the breed's adherents. And when you get down to average figures, it is no great stunt for the little breeder or the beginner to make records that are above the average. Last year the average for the mature cows in 7-day test was 507.7 lbs. milk, 18,207 lbs. fat, or less than 23 lbs. butter. Surely it pays to produce an article better than the average in quality and to demonstrate that it is better. Thus the man who is making records that may seem to him only ordinary, is really adding dollars to the value not only of the animals themselves, but all of their progeny and descendants for all time to come.

By all means do not give up making records just because you cannot make a 40 or 50 lb. record. Just keep on "sawing wood"; never lose sight of your individuality; get as much good producing blood as you can; give your

young stock a fair chance for growth and development, and you will not have to worry about a market for your surplus at prices far in advance of those obtainable by the man who loses his courage and gives up the official development of his cows. It costs money to make records, but it is an investment that is absolutely sound.

WHEN BUYING A COW.

Here are the main points of a good milker from the point of view of a stranger who must use his eyes solely: Head small and clean cut; muzzle large; forehead straight or concave; neck long and thin but not scrawny; horns somewhat small; eyes bright and prominent; shoulders thin; loin broad but not thickly fleshed as in beef cattle; thighs thin, hind quarters long, deep and strong; flank high; legs short and wide apart; tail long, slim and loosely jointed; frame wedge-shaped from all directions; udder set broadly, high up behind, square and high up on abdomen, not loose, pendulous or fleshy; milk veins large and prominent; chest deep and with well-sprung ribs; belly large and deep; teats medium sized, evenly placed and wide apart. A fleshy udder, fine to the touch when empty and retaining the size and form after milking, indicates a tendency to inflammatory troubles. The skin should be clean and thin, free from the ribs and with a fresh color; hair fine, thick and short; temperament active and docile; large feeder.

The main points in selecting good dairy cows are the large, well-balanced udders that are not fleshy; the large, roomy bodies, showing in the first case an ample laboratory for the formation of milk, in the second case a capacity for taking care of large amounts of feed.

A Holstein Bull from the Longheath Herd

Will Improve Your Herd.

Our Leading Herd Sire is

King Ormsby Canary Johanna

SIRE—Sir Pietertje Canary Johanna,

66 A. R. O. Daughters; 14 above 30 lbs., 2 above 40, 8 above 1000 lbs., 2 above 1300 lbs.

From prize-winning dams and sired by our twice Grand Champion bull, KING SEGIS ALCARTRA PRILLY, or our senior sire, KING SEGIS ALCARTRA ABBEKERK, whose three only daughters to freshen average on official test over 21 lbs. butter in 7 days at an average age of 22 months.

Dairy Cattle.

V. L. Heath, who formerly had charge of the Napa Hospital herd of Holsteins, recently took charge of the Bonita Ranch at Lodi.

The Holstein cow, Glen Canary De Kol 2nd, owned by E. C. Schroeder, Moorhead, Minn., has just completed a yearly test of 1,323.36 pounds butter from 25,590.6 pounds milk, being the twenty-ninth cow to produce over 1,250 pounds butterfat in one year.

L. D. Smith of Claremont Farm, Berkeley, has recently purchased several head of registered Guernseys from the Palo Alto Stock Farm, Palo Alto.

Lillith, a 2-year-old daughter of King of the Black and Whites, head of the Henderson Company's Holstein herd, has just completed a yearly record of 800 pounds butter and 20,000 pounds milk.

A. W. Morris & Sons Corporation of Woodland do not expect to exhibit any of their great herd this year at the State Fair. It is a loss to the fair to not have this herd represented, as there are fewer herds anywhere in the United States that could make a better showing. The herd, in fact, is a show of Holsteins in itself and is a wonderful example of what Mr. Morris and his sons have done toward putting California on the map in the Holstein-Friesian world. It is well called "The Home of Tilly Alcartra" and one that does justice to such an animal by continuing the breeding and raising of great Holsteins that are making great records all the time, many of them "strictly official."

E. E. Freeman, the Holstein breeder of Modesto, reports that Julia Clothilde of Sleepy Hollow has made a 7-day record of 19.1 lbs. butter from 504.3 lbs. milk 8 months after calving. Also, the junior 2-year-old Belle Faskie De Kol Withop produced 19.1 lbs. butter from 504.3 lbs. milk 8 months after calving, which Mr.

SAN FRANCISCO SHOW THE BIG EVENT.

The California International Live Stock Show, to be held in the California Building, San Francisco, November 1st to 8th, is organized in response to a demand of the stockmen of the State for a show that shall adequately present and promote the livestock and dairy industry of the West. It is dedicated to the proposition that the Pacific Coast offers opportunities for the development of these industries unparalleled elsewhere, and that the world should know it.

The success of the show and its value to those in whose interest it is given will depend upon the interest and support they themselves give it. While San Francisco makes the show possible, it is your show, and the Board of Directors most cordially invites you as exhibitor and attendant to a full participation in it.

W. T. SESNON,
President.

GORDON H. TRUE,
Secretary and Manager.

Freeman believes is a state record.

The Stockton unit of the Northern California Dairymen's Association has ordered machinery for bottling milk so the producers can distribute direct to consumers. At a meeting some time ago it was generally agreed that they could reduce the price from 13 cents to 10 cents per quart and still make more money for the producers.

Many heifers get thin at about three years old, observes A. Schmitt of San Joaquin county, and their owners think they have tuberculosis. The trouble will in such cases generally be found by examining their back teeth. The last of the bay teeth are likely to be loose and hurting when they try to eat. They can be pulled with pinchers and somewhat even with the fingers.

F. H. Stenzel of San Lorenzo recently sold Holstein bulls to Anita Land Company and A. Vosti, both bulls being sons of Dutchland Sir Pietertje Creamelle.

W. J. Hackett of Ceres has sold a registered Jersey bull to C. L. Woodbridge, Modesto, and another to C. J. Wylie, Los Angeles.

H. E. Vogel, Fresno, is breeding his 35-pound Holstein cow to the Higdon bull, King Korndyke Pontiac 20th and is expecting a fine calf.

The Millbrae Dairy herd of regis-

tered Holsteins consists of 280 head, according to the census recently taken by the Holstein-Friesian Association.

Walter Mitchell of Packwood Farm, Visalia, is using his 41-pound herd sire, King Abbecker Johanna Segis, on daughters of Prince Hiske Walker, who already has two 18-pound two-year-old daughters, and Segis Pontiac Crane De Kol, who has a 21-pound two-year-old and a 15.4-pound two-year-old daughter.

A. A. Jenkins of Tulare has recently sold a registered Jersey bull to C. R. Sorter of the same district. Like others in the district Mr. Jenkins has been troubled a great deal by grasshoppers and the feed has not been what it should be, but his twenty cows milking have averaged over \$20 a month each for butterfat since spring, to say nothing of the milk that has been used on the ranch, and 11 of the cows are heifers with first calf and only four are mature cows.

R. F. Guerin of Sunnyside Ranch, Visalia, has just had a two-year-old daughter of Sir Veeman Korndyke Pontiac complete a 7-day record of 20.16 pounds.

If Jerseys had as frequent milking as other dairy breeds that give more, but less rich milk, Jersey records would be even higher than they are now, according to a well-known Jersey breeder of the San Joaquin Valley.

A cow on test in his herd was giving from 60 to 67 pounds of milk a day with three milkings, but the labor question made only two milkings possible, and the cow at once dropped to about 51 pounds of milk a day. Her test averaged 4.5, the loss being thus more than half a pound of fat a day. Figuring this to a yearly basis, with due allowance for diminished milk production, and then figuring what might have occurred if the cow had been milked four times a day, it can be seen what remarkable records are possible with this breed. The trouble is that the breed concentrates its milk so into fat that the benefits of frequent milking is almost universally ignored.

Tilly Alcartra, the world's champion cow, owned by A. W. Morris & Son, Woodland, who is now at Carnation Farms, Seattle, being bred to Carnation King Sylvia, the \$106,000 bull, is expecting to stop at Portland on her way home and be the guest of Portland clubs at a luncheon to be given in her honor at the City Park. The affair is in the hands of O. M. Plummer, manager of the Pacific International Livestock Show. Nothing is too good for California animals, and when they go into other states they are given royal receptions.

H. H. Sisson, of Sunnybrook Ranch, Willits, reports the purchase from Brown Meadows Farm, Powling, N. Y., of a son of The Mighty Monarch. The latter is by King of the Pontiacs and his dam, Segis Hengerveld Fayne Johanna, recently sold at the Cabana sale for \$40,000, the highest price ever paid for a dairy cow at public auction. The dam of the calf is Springdale Segis Fayne, with a 7-day three-year-old record of 20.44 pounds butter. She traces direct to King Fayne Segis, sire of the 50-pound Segis Fayne Johanna. The bull calf is a splendid individual, of beautiful conformation and nicely marked. He should make a valuable addition to the herd sires.

The man behind the cow is useful; so is the man in front of her with the feed bucket.

FOUR GREAT LONG DISTANCE SIRES Head Morris' Herd

King Morco Alcartra

His dam is the long distance champion of the world for both milk and butter—The only cow that has produced 33,000 pounds milk in one year—The only cow that has twice exceeded 30,000 pounds milk—The only cow with an average over 30,000 pounds for four years—The only cow that has exceeded 2,500 pounds butter in two years, and the only cow that has averaged over 1,000 pounds a year for first six lactations. The cow that has won more prize money than any Holstein that ever lived. King Morco Alcartra's dam and sire's dam average 1,204.07 pounds butter and 31,125.8 pounds milk in one year.

Sir Aaggie De Kol Mead

Son of Sir Aaggie De Kol Acme and Miss Valley Mead De Kol Walker, that grand young cow that won the California State Dairy Cow Competition, over all breeds, producing 1,113.58 pounds butter in 343 days and carried a calf nine months. She broke the world's seven-day butter record eight months after calving as a senior two-year-old and again as a junior three-year-old. She is also dam of a \$6,500 son, King Korndyke Pontiac 20th. His dam and sire's dam average 1,222.68 and five of his seven nearest dams average 1,130.69.

Sir Aaggie De Kol Acme

His dam holds the strictly official yearly butter record for the world, 1,331.78 pounds and the world's butter record for two consecutive years, 2,426.88. His sire's dam was the first 28,000-pound cow and made 1,142.32 pounds butter when past eleven years of age. She has two daughters and a granddaughter above 1,100 pounds. His three nearest dams average 1,176.05. He is the sire of the only bull in the world whose seven dams average over 1,100 pounds, that sold in the Philadelphia sale for \$11,000.00. He is also sire of the only bull in the world whose three nearest dams average over 1,225 pounds.

King Aaggie Mead

Son of the great King Mead of Riverside, sire of two daughters above 1,200 lbs. strictly official test and five that average 1,025 lbs. His dam, Aaggie Acme of Riverside, made 1,054 pounds butter, finishing at past 12 years. He is full brother to the strictly official world record cow, Aaggie Acme of Riverside 2nd, 1,331.78 pounds.

With four such sires mated to a number of the greatest long-distance cows in the world, we are in position to supply young bulls with unsurpassed yearly record backing. Write us your needs.

A. W. MORRIS & SONS CORPORATION
WOODLAND, CALIF.

Who wants a higher percentage of butterfat to investigate

SUPREME GLISTA PIETJE

King of
High
Testers

His dam, her full
sister and seven
nearest dams
have an average
test of 4.5 per
cent.

Her dam, Glista Eglantine, has two 32-pound records. Her sister, Glista Ernestine, has recently completed her fifth consecutive record of over 30 pounds butter in 7 days. This wonderful performance has been equalled by only one other cow in the United States.

Bonita Herd is composed of young, high-testing individuals with A. R. O. records ranging from 18 pounds of butter in 7 days at 2 years old to 27 pounds of butter in 7 days at four years old.

A son of SUPREME GLISTA PIETJE, from one of these A. R. O. cows, will be a valuable addition to your herd. To induce the more extensive use of pure-bred sires, we will give very liberal terms on young bulls.

SONS AND DAUGHTERS OF

King of the Black and Whites

who has more A. R. O. daughters than any other bull on the Pacific Coast. One of them sold in the recent Philadelphia sale for \$2,000 and her calf for \$2100.

Another daughter has just completed a junior 2-year old record of 20,000 pounds of milk and over 800 pounds of butter. This record is excelled by only two daughters of the great bull King of the Pontiacs.

KING OF THE BLACK AND WHITES is the first bull of any breed whose seven nearest dams average over 30 pounds of butter in 7 days, four of which are 30-pound cows that have produced 30-pound daughters, who in turn have produced 30-pound daughters, all of which have 30-day records of 126 pounds or better.

KING OF THE BLACK AND WHITES is noted for his prepotency and the persistent milk production of his offspring. The first daughter to be tested, sired by his son, King Lillian Walker Segis, made over 17 pounds of butter in 7 days as a 2-year-old.

HOT WEATHER HORSE HINTS.

Water your horse as often as pos-
sible. So long as a horse is working,
water in small quantities will not
hurt him. But let him drink only
a few swallows if he is going to
stand still. Do not fail to water
him at night after he has eaten his
hay.

When he comes in after work,
sponge off the harness marks and
sweat, his eyes, his nose and mouth,
and the dock. Wash his feet but
not his legs.

If the thermometer is 75 degrees
or higher, wipe him all over with a
damp sponge, using vinegar water if
possible. Do not wash the horse at
night.

Saturday night, give a bran mash,
lukewarm; and add a tablespoonful
of saltpetre.

Do not use a horse-hat unless it is
a canopy-top hat. The ordinary bell-
shaped hat does more harm than
good.

A sponge on top of the head, or
even a cloth, is good if kept wet. If
dry it is worse than nothing.

If a horse is overcome by heat, get
him into the shade, remove harness
and bridle, wash out his mouth,
sponge him all over, shower his legs,
and give him two ounces of aromatic
spirits of ammonia or two ounces of
sweet spirits of nitre, in a pint of
water; or give him a pint of warm
coffee. Cool his head at once, using
cold water or, if necessary, chopped
ice, wrapped in a cloth.

Watch your horse. If he stops
sweating suddenly, or if he breathes
short and quick, or if his ears droop,
or if he stands with his legs braced
sideways, he is in danger of a heat or
sun-stroke and needs attention at
once.

If it is so hot that horse sweats in
the stable at night, tie him outside
with bedding under him, or turn him
loose in a corral. Unless he cools
off during the night he cannot well
stand the next day's heat.

Sheep Suggestions for Beginners

(By Prof. Gordon H. True, University Farm, Davis.)

Sheep are kept in California under three main sets of conditions: On the unfenced public or private ranges where they run in bands of two or three thousand head; on fenced mountain ranches of a few thousand acres, and where other farm activities may or may not be carried on.

For use on the open ranges where sheep are run in large bands under the care of a single herder and his dogs, a preponderance of fine-wool blood, such as Merino or Rambouillet, is necessary on account of the natural banding instinct of this class of sheep.

Sheep run in the open range move constantly from one feeding ground to another. As the snow melts and green feed starts in the mountains the sheep are moved to keep pace with the coming of the new feed. Lambing takes place in the spring, usually in March or April. It is not customary to provide shelter, though it has been found profitable to do so. Flocks lambing in sheds have raised as high as 140 per cent of lambs, while losses in the open are often 40 to 65 per cent in case of bad weather at lambing time. The flock is shorn once a year—before lambing in the spring. The average clip is about six pounds of wool. The increase may be marketed as lambs when the range is in good, but more frequently they are carried on to be sold as yearlings. Lambs weighing eighty pounds sold last year at from \$10 to \$12. Under pre-war conditions \$5 was considered a fair price.

Sheep are especially adapted for grazing over rough land of scanty herbage. They eat many plants not eaten by cattle. On farms they keep

down weeds and other volunteer growth along ditch banks, lanes and on summer fallow. As hogs consume waste grain, fruit and dairy by-products, so sheep use what would otherwise be waste roughage on the farm.

In the valleys where they run on stubble fields, it is the practice to shear twice a year, in March and September; otherwise once a year in spring. The clip will run from six pounds to twelve pounds a head, some fine-wool ewes shearing as high as sixteen to twenty pounds. It is good practice to dip sheep after shearing.

Thin lambs may be bought and fattened for market by running them on stubble for three or four weeks and then feeding hay and grain for two or three months. On full feed lambs should eat two pounds of hay and one pound of grain a day, and gain from one-fourth to one-third of a pound in weight. Ewes may be wintered on hay and volunteer growth, with some grain at lambing time. Cull or damaged beans are especially relished by sheep.

A pure-bred ram of good type should always be used. The period of gestation is five months, and the natural breeding time is September or October. Neither ewes or rams should be used for breeding under a year old. The ram should not run with the flock, but be turned with the ewes for a short time each day. During the breeding season he should be fed some grain.

Expensive buildings are not required for sheep, but they need protection from the rain. The dog is the sheep's worst enemy and where there is danger sheep should be put in dog-proof corrals at night. One should see and count the flock every day.

SHEEP NOTES.

Joe Levy of Calla Grove Farm, Manteca, who is one of the leading Hampshire breeders of the Coast, will show 8 head at the State Fair.

Wm. Bond of Newark, who some time ago purchased the registered Hampshire flock owned by T. T. Miller of Hollister, will show 4 head at the State Fair.

Chas. Kimble of Hanford recently shipped 25 head of Rambouillet ewes to breeders in Texas and Mexico. Mr. Kimble will attend the Salt Lake sale and purchase some rams to go with these ewes.

Ellenwood & Ramsay, Corriedale breeders of Red Bluff, who recently imported some very high priced animals from New Zealand, will show 4 head at the State Fair.

Bullard Bros., of Woodland, who have a reputation of capturing a lion's share of ribbons, will show 60 head of Rambouillets at the State Fair and expect to make a big clean-up.

The wool consumed in the United States last month broke the monthly record for 1919, the amount consumed being 55,000,000 pounds, grease equivalent. This is said to indicate continued activity in the textile industry.

WHEN SELECTING BREEDING SHEEP.

CHOOSE EWES THAT ARE—
Well grown, healthy and spirited.
Sound in mouth and milking organs.
From one to four years old.
Covered with dense coats of marketable wool.

Uniform in size and breeding.
Straight in body lines and showing feed capacity.

GET A RAM THAT IS—
Bold in head features and strong in constitution.

Active, vigorous and from one to three years old.

Symmetrical and evenly developed.
Covered with firm flesh.

Strong and straight in his legs.
Evenly covered with a dense fleece.

WHY NOT TRY IT?

Daddy had the flu, and mamma was busy sterilizing the dishes she had just carried from the sick room.

Four-year-old Jimmie watched the process for a time, and then asked: "What for are you doing that?"

"To kill the germs, so that we won't catch the flu, too."

"Has daddy got germs?"

"Yes."

"Why don't you boil daddy?"

HAMPSHIRE SHEEP

As a money-maker and all-around farmer's sheep, the Hampshire challenges the world to produce its equal. Its chief characteristics are: ability to stand grief from exposure or shortness of feed; docility and motherly qualities; adaptability to climate and feed; prolificacy; precocity, and the early maturity of the lambs.

THE BEST OF THE BREED

My foundation stock consists of ewes sired by a Walnut Hall ram and bred to an outstanding imported ram. I have endeavored to secure the best animals of the breed in both individuality and breeding, and will be able to offer California buyers as good stock as can be found anywhere. Keep your eye on my herd.

Efficient Cows Lower Cost of Production

Written for Pacific Rural Press.

At the end of the Civil War it required three hours of human labor to harvest a bushel of wheat, but by improved machinery it now takes only ten minutes of the human labor to harvest a bushel of wheat says Dean H. E. Van Norman of University Farm, Davis.

Our scientific leaders tell us that every growing child should have about a quart of milk a day. Therefore, there rests on the dairymen not only the business of producing the milk at a profit to themselves, but something of a national moral obligation to furnish to the growing children of this nation a necessary food.

How much of a cow's time does it take to produce a quart of milk—one day's supply for a growing child? The average cow in the United States produces about 14 pounds of milk a day, at which rate it would take her about 206 minutes to produce one day's supply of milk for a child. A good cow, on the other hand, yielding

6,000 pounds of milk per year would require only 144 minutes, while the kind of cows that a progressive, successful dairyman ought to have would only require 96 minutes to produce this same amount of milk. Boiled down, the question is, which kind of cows have you?

The most outstanding sign of today is that we must reduce the cost of production to insure satisfactory profits. One of the greatest factors in this reduced cost of production is more efficient cows. It takes just as much human labor to feed ten poor cows as to feed ten good ones. It takes almost as much human labor to milk the poor ones as the good ones. It takes just as long to deliver their product to the creamery or shipping station. Therefore, there is a tremendous saving in the actual cost of production when the cows average 9,000 pounds of milk per year as compared with those that average only 6,000 or 4,000 pounds.

Palo Alto Picked a Plum

Written for Pacific Rural Press.

Years ago when the writer was new in the breeding game, he was anxious to make the right start. So he went to one of the most successful Holstein breeders in the east and asked him what was the most important rule to be observed in successful breeding. "My boy," advised the veteran, "buy the best bull you can afford; keep his most promising daughters, and then breed them to one of his best grandsons. I know that many breeders will poo-hoo such a method, but it is the most scientific kind of line-breeding, and scientific line-breeding is what makes each generation show an improvement over the one before it."

When I visited Palo Alto Stock Farm last week to see the new bull calf purchased at the Cabana sale and looked over his pedigree, I wondered if the president, M. H. Tichenor, had been given the same advice when he also lived back in New York State. For I found that the new bull, Pioneer Pride, who was purchased at a cost of \$4,300 to use on the daughters of the senior herd sire, King Pontiac Segis Korndyke, is a grandson of this King, as he is called at the farm. He is by King's son, FINDERNE PRIDE JOHANNA KORNDYKE, who was out of FINDERNE PRIDE JOHANNA RUE, the wonderful cow that made three world records, including a record of 36.03 lbs. at 11 months after calving, and 1,470.59 lbs. in one year.

The dam of the new bull is Pioneer Bessie, who completed a 7-day record of 41.20 lbs. butter from 713.7

lbs. milk the night before she was sold, and brought \$7,100 in the Cabana sales ring. The dam of her sire and the dam of the young bull's grandsire are sisters, both being by Pieterje Hengerveld's Count De Kol, with 99 A. R. O. daughters, and thus further strengthening the already strong pedigree of Pioneer Pride.

This youngster is just as good in individuality as he is in breeding. He has a clean-cut, intelligent, masculine head, one of the best top lines you ever saw, good bone, excellent heart and lung capacity, and fine barrel. He is more white than black, and is ideally marked. He ought to make a great show bull, as well as a prepotent breeder. He will be given an excellent opportunity to make a name for himself, and his purchase by the Palo Alto Stock Farm means much to the Holstein industry of this state.

USEFUL MILKING SHORTHORN.

G. W. Watson of Napa Judction has taken great interest in Milking Shorthorns for years, and many animals have passed through his hands. We recently saw an account of the results obtained from one cow of that breed which he had just sold for beef at the ripe age of nineteen years. She dressed 660 pounds in good condition and brought \$92. Mr. Watson said of her:

"I used her for milking up to fourteen years old. She was good for six gallons a day at all times, and at the

C. L. HUGHES, Sales Manager, Sacramento, Cal.

age of nine years she had to be milked three times a day for some time after coming fresh. She kept the house in all the milk and butter needed, besides raising me many good bulls and heifers. I have sold over \$1000 worth of stock from her, and yet have a few of her descendants left, worth several hundred dollars. I call that a good showing for an unregistered animal, one of which would doubtless be passed over by some of the wise ones on the milk question as not worthy of consideration. Now at the age of nineteen, after rolling in a good bank account, she hung up a fine piece of beef, and made carcasses from the dairy herds indeed look second choice."

Why Not Credit Unions for Farmers?

"There should be provided a system of personal credit unions, especially for the benefit of individuals whose financial circumstances and scale of operations make it difficult for them to secure accommodations through the ordinary channels. Organized commercial banks make short-term loans of a great aggregate volume to farmers possessing the requisite individual credit, but there are many farmers who, because of their circumstances, are prevented from securing the accommodations they need. The men I have especially in mind are those whose operations are on a small scale and who are not in most cases intimately in touch with banking machinery who know too little about financial operations, and whose cases usually do not receive the affirmative attention and sympathy of the banker. Such farmers would be much benefited by membership in co-operative credit associations or unions."—David F. Houston, Secretary of Agriculture.

One of the greatest needs of farmers is short-time personal credit on reasonable terms. The Federal loan banks are taking good care of the land-mortgage requirements in many cases, but they are not always available for new settlers and for farmers who need personal loans to buy livestock, implements or other equipment. The need for short-time personal credit is shown as a result of an investigation by the Department of Agriculture in one section where it was found that 60 per cent of the farmers depend upon advances from merchants during the crop-producing season. Credit extended by merchants, commonly known as the advancing system, is usually exceedingly high. It is estimated that hundreds of millions of dollars would be saved by the farmers each year if the means already adopted in a number of communities were put into general use. The means referred to is that of properly organized rural credit unions.

In nine states laws have been enacted under which farmers may organize credit unions. These laws enable the farmers who are members to obtain loans on terms which compare favorably with those secured by the city business men.

The movement of surplus funds of the individual farmers has in general been toward the city, but rural unions encourages the retention of money made on the farm where it is most needed. In addition it tends to turn the current of urban capital toward rural districts, as outside credit is secured through regular credit channels, the banks.

The plan followed in North Carolina, where 18 strictly farmers' organizations are now in operation, should be of interest. A branch of the State government, known as the Division of Markets, has been charged with the work of encouraging the organization of credit unions among the farmers, and a superintendent gives practical assistance in their organizations and supervision of their activities.

Twelve or more persons in the community may organize a credit union, the first step being to sign an application for assistance, which is addressed to the Superintendent of Credit Unions. Under his direction a meeting is called for the purpose of arousing further interest and spreading information concerning the plans and purposes of the proposed organization. If the community is sufficiently interested an organization is formed, by-laws are adopted and five persons are selected for directions. A credit committee and a supervisory committee, each composed of three members, are also named. The cost of incorporation is limited to the notary fees and \$3 for the recording and filing of organization papers with the Division of Markets.

The board of directors appoints a bank committee to select some local institution through which the union does its business. The credit union is accorded treatment similar to that which one bank gives another. As a rule it receives 4 per cent interest on time deposits and 3 per cent on monthly balances, while it borrows from the bank at 5 per cent interest.

Each member buys one or more shares of stock at \$10 a share, and deposits with the union any idle cash that can be spared. The union also accepts deposits from non-members. Its operations are similar to a small scale bank, but it is able to operate at a minimum of expense since most of the overhead expenses of a regular bank are eliminated. The officers with the exception of the treasurer, receive no compensation. The treasurer, who is required to devote three or four hours a week to the business of the organization, usually receives a salary of about \$50 a year. The credit union thus becomes primarily a mutual society of borrowers and depositors operating under State law.

THINGS THAT DON'T PAY.

It doesn't pay to lose the services of a good man.

It doesn't pay to leave implements and harness out in the rain and sun. It doesn't pay to buy fertilizers and allow the farm-made manure to go to waste.

It doesn't pay to have fences out of order and disorder around the home and sheds.

It doesn't pay to turn cattle into corrals or fields where there is no shade.

It doesn't pay to feed poor stock. It doesn't pay to let good stock go short of feed.

It doesn't pay to have the home so short of proper equipment that wife and daughters have to slave to do the work.

It doesn't pay to subscribe to the Pacific Rural Press and not give thought and attention to the ideas it suggests.

CLAREMONT HERD GUERNSEYS

Represent the best blood lines of the breed. They combine big production and show type.

See them at the State Fair.

L. DEE SMITH, Proprietor

R. R. BERKELEY,

CALIFORNIA

START WITH GUERNSEYS

This is the breed to take up if you want to make the greatest possible profit from dairying. The Guernsey is noted for the most economical production of milk and butterfat, as well as the best flavored and highest natural colored products. In all impartial trials the Guernsey has shown greater returns for each dollar invested in feed than any other breed.

BEGIN WITH THE BEST

We believe that our herd cannot be surpassed anywhere in uniformity of type, health, breeding and production. Heretofore most of our cows have been held above price, but now, because of the rapid increase of our business along other lines, we are compelled to disperse this entire Guernsey herd.

100 HEAD AT PRIVATE SALE

Everything goes; not an animal reserved. There are 83 females of great production and promise; 17 males that are real herd headers. Twenty-one of the cows have Advanced Registry Official yearly records of from 500 to 800 pounds butterfat, and several more are now on test.

If you want show quality as well as heavy production, you will find them here. The herd includes the grand champion cow and the junior champion bull at the last San Francisco Show, and many young animals fit to win in the hottest competition. Will sell separately or in lots.

FEMALES OF GREAT PROMISE

While a good share of the mature females have been given records, they have not been forced, and there is not a cow in the herd that has shown her limit of production. Also many of the untested cows give promise of making even better records than the ones already tested.

BULLS FOR BREEDING UP

Guernsey bulls quickly build up grade herds. They are so prepotent that they stamp the breed characteristics upon their offspring to a marked degree, and soon you have profitable producers of quality products. We offer some royally bred young bulls that will quickly double the profits from your herd.

Your Opportunity—Act Quickly

The sales list is completed and we are ready to sell. Breeders know how difficult it has been to secure good Guernsey stock, and will jump at this chance. Don't put the matter off. If you want foundation stock for a registered herd, new blood for an established herd, exhibition stock for the fall shows, or a bull to breed up a grade herd, come at once and make your selection. If you can't call, write your wants fully. But don't delay.

Write for Price List. DO IT TODAY.

What the Hog Furnishes Us

Written for Pacific Rural Press.

We often hear it said that packers use all of the hog but the squeal. But how many of us really know what all of the by-products are? The list is a long one, and it is interesting to know of the uses made of some of these products as told by Armour & Company in their booklet, "Progressive Hog Raising."

The packing business of fifty years ago was a very simple affair. Hogs were cheap. Pork, also, was cheap, but not so cheap as hogs, and the margin of profit was liberal. Hogs were slaughtered for carcass and lard, and the offal was thrown away. From that day to the present, however, by-products have been utilized in ever-growing proportions, and today packer's profits are almost wholly derived from the parts formerly thrown away.

Approximately 17 per cent of each carcass—exclusive of government condemnation—is lost in the form of moisture at various stages of dressing and by evaporation in processing and curing. About 60 per cent goes into the cuts.

Among the edible by-products of the hog may be mentioned pepsin, derived from hog stomachs; livers used in the manufacture of liver sausage; and neutral, a specially prepared lard, largely used as an ingredient of oleomargarine.

Lard proper is not commonly considered a by-product. It is one of the primary products. Nearly 15 per cent of the average hog goes into lard. Part of this lard is further processed into lard oil and lard stearin. The lard oil is used for illuminating purposes and as a lubricant. Stearin enters into the manufacture of chewing gum and soft candles.

Brains are produced in enormous quantities. They are the most perishable of all the by-products, but by artificial refrigeration they are saved in summer as well as in winter, packed in cans, frozen, and sold in all parts of the country.

Tongues lend themselves to the making of high-grade canned or pickled meats. Hearts are a valuable ingredient in sausage making. Tails, snouts and ears are rich in gelatin, or glue, and also are sold for boiling with kraut and other vegetables.

Kidneys are distributed in a canned or frozen condition. Milts, or spleen, are sold to the government and other agencies for maintaining fish hatcheries, and serve as a feed for growing

fishes. The "black" or curly intestines of the hog are carefully cleaned, processed, and made into chitterlings, an inexpensive food to be fried like oysters, much favored by colored people.

Stomachs are used as sausage containers, the lining being first removed and used as a sort of pepsin.

Something like 7 per cent of the weight of the hog is represented in inedible by-products in the raw state which are afterward manufactured into glue, soap, glycerine, blood meal, tankage, curled hair, and fertilizer material. In the finished state these products represent only about 4½ per cent of the weight of the hog.

Glycerine, a by-product of soap making, was in great demand during the war as an ingredient of nitroglycerine and other explosives. Glycerine itself possesses no explosive properties, but serves as a medium for powerful nitrates in much the same way as cotton serves in the manufacturing of gun-cotton.

Even the rinds from skinned hams and bacon, as well as the back skin of the hog, are utilized, pig skin leather being made from them.

Blood is used in small quantities in blood pudding. Some of it is dried and ground into blood meal, a valuable feed for poultry and livestock. Calves fed on skim-milk without blood meal are subject to scours. The great outlet for hog blood, however, is an ingredient of fertilizer.

Tankage, a bone and fiber residue from the rendering tanks, is valued chiefly as a hog and poultry feed, and finds a ready market.

The hair is curled for upholstering purposes. Hoofs are ground into hoof meal, a quick-acting fertilizer for florists, grape growers and others.

Every part of the hog is handled or processed in such a way as to bring a maximum of value. Even the waste waters from the packing plant are evaporated into a thick brown wax, known as "stick" because of its adhesive properties, and used in fertilizer for its high nitrogen content. The bone meal left after the extraction of glue from feet, tails, ears and miscellaneous bones, goes into fertilizer. It is also used in making phosphates for baking powders and other compounds. Bone ash is used in making crucibles for glass making, metal refining, etc. Bones are also burned to a charcoal for use in the purification of syrups in the manufacture of sugar.

Pig Tails with the Right Curl

Written for Pacific Rural Press.

Just as soon as pigs are strong enough to follow their mother get them out on pasture, if possible. Following the sow in the open is one of the safest treatments ever given pigs, and a sure preventative of thumps.

Begin feeding the pigs as soon as they will eat, giving them a little slop daily to supplement the sow's milk.

It is better to carry pigs looking a little thin, but lively and hungry, than to scour them by getting them over-fat, but if they have plenty of exercise there is little danger. They will eat heavily, but if properly fed the feed will go to make bone and muscle instead of fat. The pig that is a good grower is necessarily a good eater.

Keep pigs of one size together. If you don't, the smallest will not thrive. Push them all they will stand, and make them show good growth every day.

Feed at a regular time morning and evening. Pigs know when meal time comes, and are on hand at the established hour. If they have to wait too long they become impatient, lose their temper, and worry off a few pounds of flesh at your expense.

Educate yourself to know whether or not they are doing well. See that they are active, eating regularly, and gaining properly. If they do not clean up their feed promptly they are being over-fed, thus wasting feed and upsetting their digestion.

If pigs are trained to eat slop before they are weaned there will be no setback at weaning time, and they will develop into big pigs at an early age.

Never let yourself think that the weaned pig is raised. He still needs lots of attention besides proper feeding. Give him minerals, worm treatment, crude oil for lice—a fair chance to make a hog of himself.

Only a few breeders wait until after weaning to castrate cull boar pigs. Better do it a week or two before the sow and pigs are separated; then there won't be too much of a setback at one time.

The most profitable gains are made by the young pigs, and they should never be forced to live on pasture without grain. Give them at least two pounds of grain for each 100 pounds of body weight. It will pay.

Look out for wet bedding. It causes scours and other ailments, and a waste of feed and a loss of pigs is the result.

One of the cheapest necessities for the growth and development of the pigs is water. They should have access to it at all times. They need a great deal during the hot months. Plenty of water and pasture cheapens the feed cost.

If the hogs are on soft ground, watch their feet and trim them if the toes grow out too long, or you will have them down on their pasterns when there is no need of it.

Look Out

LIVE OAK,

R. F. D. 1,

Sutter Co., Cal.

In the Swine Word

Written for Pacific Rural Press.

H. C. Shinn of Tulare has a great young Poland-China boar pig by Bidges' Bob Wonder that already measures 26 inches high and 42 inches long.

H. D. McCune, Lemoore, has sold 2 Poland-China bred gilts to L. J. Woodhead of Stratford; also a daughter of Massive Orange bred to McCune's Buster. Mr. McCune has a litter out of Surprise Prospect that certainly is great. One of the boars weighed 70 pounds when 82 days old.

E. D. Elliott of Strathmore has made fine start in the purebred Duroc business by securing two bred gilts from R. C. Sturgeon of Tulare. At the same time he took home one of Sturgeon's fine young Holstein bulls.

E. S. Myers of Riverdale is mourning over the loss of his herd boar President Jr., who died recently from heat. To take his place Mr. Myers has purchased from John Bernstein the young Eastern Poland-China boar, Big Square Jumbo's Equal, from the famous Meharry herd of Tonolo, Ill. We all know what Big Square Jumbo is doing for Meharry and Mr. Myers expects this young boar to do as much for him.

Until 2 months ago R. C. Sturgeon of Tulare was in the habit of feeding rolled barley dry to his hogs, but after this it is always to be fed moist. He says that it did not take long for the smaller pigs to show that they liked the change and although the grown hogs may not show any difference, the moistened barley is evidently better for them too. If the small pigs continue to show the benefits of the change of feed until they are mature they will be wonders, because their parents are top stuff as it is. The barley for evening feeding is put to soak at noon, that for the morning feeding in the evening. Then after milking, the separated milk from the registered Holstein herd is mixed with the moistened barley and the whole thing fed as a slop.

Hog shipments from Kings county have amounted to more than 400 car-

loads during the last year and recent prices have reached the same figures as those paid in Chicago on the same dates. The 30,150 hogs shipped during the year brought the breeders approximately \$1,005,000, and the amounts received for registered animals would swell this figure greatly. The one shipment of 1,200 head made from Hanford still remains the largest ever made at one time by any county in the State. Kings county certainly has a secure place on the map as the swine county of the State.

HOW PIGS ARE LOST.

That the heaviest losses of young pigs are largely preventable by proper housing arrangements and care of the sow before farrowing, is proved by the list of percentages in the following table, which is the summary of data secured from 192 farms in Illinois.

	Per Cent.
Overlaid by sows	29.13
Farrowed weak	22.34
Farrowed dead	15.88
Killed	10.09
Eaten by sows	4.59
Aborted	4.55
Scours	3.43
Thumps	1.78
Necrobacillosis	1.56
Cholera	1.01
Miscellaneous	5.64

Have you put up guard rails in your farrowing pens? If not, better get busy. No need of your losing 29 per cent of your pigs when 2x4 scantlings placed 8 inches from the floor and 6 or 8 inches from the walls will almost entirely prevent over-laying.

For fencing off a portion of a field in pasturing hogs temporarily, use 32-inch or 36-inch woven wire stretched and tacked to stakes driven in the ground. Well-fed hogs are easily kept in place, but underfed ones will require more substantial fencing.

Pino Vista Durocs

Easy keepers, quick developers, large litters. The best blood lines in our herd. Bred sows and gilts, and weanlings of both sexes for sale.

Satisfaction guaranteed.

Glenn County for Durocs

Showings of Swine

Written for Pacific Rural Press.

A. D. McCarty of San Francisco, who used to make such a cleanup with his Yorkshires from Riverina Farm, Modesto, will show Poland-Chinas for the first time this year and will have a great herd of 21 head filling nearly all classes. This will include his great senior yearling boar, King Jones Over.

Shinn & Elliott of Tulare have a great lot of Poland-Chinas, and they should make a very successful round of the fall shows. They have some excellent Eastern stock, as well as California bred stuff, that cannot help but attract attention.

Another one of the young breeders who has "shed his hat into the ring" this fall is J. H. Cook of Paradise. He has been interested in the registered hog business for a long while and has some dandies. So look out for the "pigs from Paradise."

Langhorst Bros. of Lodi are among the new breeders who will enter Poland-Chinas for exhibition at the State Fair this year. Their herd sire, Golden State King, is a great breeder and many of his get will be shown at the fall shows both east and west.

Eugene Miner of Lodi is keeping his herd strictly fashionable in type and breeding. His senior herd sire is now to be followed by California Big Bone Bob, a great junior yearling. These boars, with such sows as Molly Giantess and a number of younger sows of equal merit, cannot help but produce what breeders are looking for these days.

N. K. Horan of Lockeford will show a few Poland-Chinas of great substance and quality. This herd is strong in the blood of Big Bone Bob and Major Hadley Wonder, two of the great sires of this breed in California.

Among the veteran Poland-China breeders of California who can always be counted upon for an exhibit at the State Fair is W. A. Young of Lodi, and this year is no exception, as he expects to be there early with 37 head. From boars down to junior pigs he will have representatives in nearly all classes. If we judge the future by the past Mr. Young's entries will be formidable competitors, and it will be found that Mr. Young has not been "asleep at the switch" when the judge inspects the Poland-China classes.

With a bunch of 14 classy tops from his Poland-China herd, J. F. Lehman of Lodi will be at the State Fair this year. Among the young boars that he will show will be several full brothers of the "Big 10 Litter" shown by Mr. Lehman last year that caused so much favorable comment.

J. W. Wakefield of Acampo has entered 19 from his Poland-China herd that well might be termed Wakefield's Wonders, they are so good from the viewpoints of size and quality. One of the young boars that Mr. Wakefield will show, sired by Big Bone Bob, is a very smooth youngster and weighed 180 pounds at 5 months and 6 days old.

Rancho Del Sur of Lancaster, Donald Graham, proprietor, is coming up from the south with his great herd boar Orion King Gano and a lot of females just as good to make a bid for first honors at the State Fair. Mr. Graham has an excellent herd and will no doubt take his share of the ribbons back with him.

DUROC GILTS

Orion, Long Wonder and Volunteer Breeding.

Also young pigs by a son of Johnson's Defender. For prices and particulars write

GUY H. MILLER

E. 1., Modesto, Calif.

DUROC JERSEY BOARS

Rancho Del Sur offers 15 good fall boars sired by Orion's King Gano and California Orion Cherry King. I guarantee these boars to please you. Those bought on mail order may be returned if not satisfactory.

DONALD H. GRAHAM.

P. O. Box 177, Lancaster, Cal.

Harvey M. Berglund, Duroc-Jersey breeder of Dixon, will be in the ring with 18 of his red beauties that are bred, fed and finished just about right from the fashionable viewpoint. Mr. Berglund recently purchased the entire herd of Fred M. Johnson of Napa, which gives him a larger number of tops to draw on for exhibition and breeding purposes.

Gardiner Ranch of Sacramento will make a small showing of 6 head, but they will make up in quality what they lack in numbers and surely will be heard from.

The Winsor ranch herd of Durocs, Bonita, will be shown at Sacramento, San Diego, Riverside and Los Angeles this fall and will prove one of the attractions of the swine exhibits.

W. F. Sandercock of Sacramento will be the largest exhibitor of Berkshires, having entered 26 head, most of which are daughters of Baron Duke 201st. Mr. Sandercock has his stock in fine shape and expects to win his share of the awards.

It does not seem to make much difference what age the Chester Whites bred by C. B. Cunningham of Mills may be; they may rightly be termed Billiken boosters, for the blood of this great boar shows very strong in the herd and with their strains have almost made a new Chester White that finishes at any age and still retains its prolificacy and constitution. Mr. Cunningham will have a large showing at the State Fair.

When you get tired of looking at hogs take a walk over to the Calco Farm exhibit of the California Corrugated Culvert Company and see some up-to-date metal hog troughs, watering tanks and automatic grain feeders. They are time and money savers.

WINSOR RANCH MAKES LARGE DUROC IMPORTATION.

The Winsor Ranch, Bonita, has just made one of the largest importations of registered Duroc-Jersey hogs ever brought to the Pacific Coast. R. K. Walker has spent the last six weeks in the East and traveled over ten thousand miles hunting for the finest specimens of the breed. The fact that he paid as high as \$800 for sows and \$2,000 for one under-year boar speaks well for the class of stock he secured.

The purchase includes 85 sows and gilts and two boars. Eighty of the gilts—real brood sow prospects in both breeding and individuality—will be bred to three Winsor Ranch herd boars, Great Model, Great Sensation 3rd, and Winsor Giant Orion. The latter, one of the new boars just purchased, is the sort the Duroc breeders have been trying to produce—of tremendous size, but absolutely smooth, deep and showing exceptional feeding qualities. He is 82 inches long, 40 inches high, and weighs 965 pounds. Great Sensation 3rd, a fall boar, has a 9-inch bone, and is 65 inches long and 36 inches high already. He is by Great Sensation, out of the \$5,000 Uneeda Lady. Some swell breeding.

BOAR DON'TS.

Don't let boar pigs run with gilts after they are four months.

Don't grow a boar for a herd header with a lot of others. He'll not get the individual care he should have.

Don't stuff a boar pig at any time. Give him good feed, but make him clean it up at once—not any time before the next meal.

Don't let him gain over a pound and a half a day. And make this growth, not fat. Plenty of protein will do the trick.

Don't let him rant. A fence walker never makes a good herd boar.

Don't get in the habit of scratching the boar's back. He likes it and he humbly lowers his back as a petition for more rubbing. The first thing you know he has formed this habit of dropping his back, which spoils his looks and lowers his value in the eyes of a pure-bred breeder. It disqualifies him for the best hog society, arched back."

PLAN TO ATTEND THE LOS ANGELES LIVESTOCK SHOW.

In presenting the premium list of the Second Annual Livestock Show to be held in Southern California, the directors of this enterprise wish to assure exhibitors, breeders and the public that no effort has been spared to make the display one that shall reflect the best in every phase of the farm stock industry. While Southern California offers various advantages in breeding, it has not been until recent years that systematic, coordinated effort has been made to bring its herds to the high standards set by the older communities of the Nation. It is believed that the second annual show will demonstrate conclusively that a wonderful beginning has been made toward bringing Southern California stock to the highest class—to make it rank with the horticultural and agricultural products of this section.

Our shows are co-operative enterprises, designated to stimulate breeders to better efforts and to educate the people at large to the full meaning conveyed by the word "thoroughbred." We trust that exhibitors and the public will meet us in the same spirit and with equal enthusiasm for the cause.

Board of Directors, Los Angeles Livestock Show,
C. R. THOMAS, Manager.

New Light on Worms in Pigs

Recent researches into the life history of the common round worm in pigs has brought to light knowledge which should be of great interest not only to hogmen, but to people generally. Wallace's Farmer. It seems that the round worm which infests pigs may also infest children, and that rats sometimes act as carriers. More astounding yet, it appears that pneumonia, thumps and similar lung troubles in young pigs, and possibly oftentimes in children as well, may be due to this parasite.

For most up to date information is to B. H. Ransom, of the U. S. Department of Agriculture. He has the worm eggs as they are excreted in large numbers in hog manure, to rats, mice, guinea pigs, rabbits, pigs and lambs. In every case except that of the older hogs, the eggs seemed to hatch in the intestines into microscopic worms less than one twenty-fifth of an inch in length, and these minute worms then follow their way through the intestinal tract soon reaching the lungs and causing pneumonia. In pigs the symptoms often seem to be identical with those of thumps. At this stage of the disease, many of the animals were killed and carefully examined. The microscopic worms were found in large numbers not only in the lungs but also in the trachea, esophagus and stomach. Further study indicated that in rats, mice, guinea pigs and rabbits these microscopic worms passed from the lungs back into the intestines again and out with the manure. In the case of pigs, sheep and human beings, however, these microscopic worms go from the lungs to the intestines and grow into typical worms several inches in length. At this stage they lay more eggs, which pass out with the manure. The eggs are extremely long lived.

Ransom states that in laboratory experiments they have been stored for years and still have retained their vitality to cause infection. The microscopic worms, which may be given off in the manure of rats, mice, etc., do retain their vitality very long, and it is thought that ordinarily the infection is by way of worm eggs passed out with the pig manure rather than with microscopic worms passing with rat or mouse manure.

It is not definitely known that all pneumonia and thumps in pigs is caused by the microscopic form of the round worm when it migrates to the lungs, but preliminary investigation indicates that a great many cases are due to this cause. It is interesting to know that young pigs are very susceptible to infection, whereas older pigs are practically immune. It is believed that the young pigs are particularly infected by the dirt clinging to the sow's udder. It seems to be a fact, therefore, to keep the nursing sows as clean as possible, and to have clean pasture free from holes or in buildings with cement floors that can be cleaned out frequently and thoroughly.

Another point to be kept in mind is that the worm eggs may live for a number of years, standing winter cold and summer drouth. The mere fact of hogs having been on the place one time is no insurance against infection unless the premises

have been very thoroughly cleaned and the lot deeply plowed.

After the round worms reach their adult form in the intestines, the stage with which most of us are familiar, they may be dislodged by any one of a number of proprietary worm remedies. The standard home-made preparation is calomel and santonin, at the rate of 5 grains of calomel and 7 grains of santonin per hundred pounds of pig weight. In view of the fact that the lung trouble so often caused by the microscopic, immature worms is fully as serious as the intestinal trouble caused by the adult worms, it would seem the part of wisdom not to rely altogether on curative measures, but to take sanitary steps to reduce the number of worm eggs around the lots, buildings and hog wallows. Precautions of this sort would seem to be doubly worth while in view of the fact that this parasite may also infect children.

BURY DEAD ANIMALS.

The carcasses of animals which have succumbed to infectious diseases like anthrax, hog cholera, blackleg, tuberculosis, etc., are charged with myriads of virulent disease germs, and just as long as they remain where animal scavengers can reach them and portions of them can be carried away promiscuously, they are a dangerous menace. Even carcasses of animals which have died from other causes than infectious diseases, unless they are disposed of in a proper way, are a source of danger. Left on the surface of the ground, their odor soon invites scavengers to congregate and to bring with them the infectious material with which they may have become contaminated by eating carion elsewhere.

Dead animals on the farm should be buried deep enough to prevent them from being dug up again, or they should be burned. To burn large carcasses like those of dead horses and cattle is difficult and laborious and requires a large quantity of fuel. In most instances it is most economical to bury them. All animals which have died from infectious diseases and are buried should be covered with a heavy layer of lime before the graves are closed.

Everywhere farmers not only should attend to the safe disposal of their own animals which unfortunately die, but they should insist on the proper disposal of the bodies of all animals which die anywhere in the regions in which their farms are located.

The healthy, vigorous pig is armed to defend himself against attack of disease and repulse it. Therefore keep him in vigorous health for profitable growth and to escape disease.

Rural Press Takes Place of Farm Advisor.

Enclosed find check to renew our subscription for three years. I am comparatively new at the farming game and cannot succeed without the Rural Press. It is very helpful. We have no farm advisor in our county at present, but your paper takes the place of one.—H. G. Merrill, Paso Robles.

MONTELENA HERD —OF LARGE— YORKSHIRES

LAKE PARK KING 25211

Grand Champion Boar—California State Fair, 1917.

Due to the ever-increasing popularity of the breed, Yorkshire breeders are almost entirely sold out, and it would behoove the prospective purchaser to place his order soon.

We are only able to offer at the present time a very exceptional lot of fall pigs, some sired by "Lake Park King," others by "Montelena Prince 2d." They are out of such sows as "Deer Creek Nena 8th," present Grand Champion sow of the State, who has averaged a fraction over 17 pigs per litter for nine consecutive litters; "Riverina Nena 9th," one of her best daughters, and "Lake Park Lady Frost 291st," the top sow at the Thomas H. Canfield sale last year.

We solicit your correspondence.

A. L. TUBBS CO.
CALISTOGA CALIFORNIA

LLOYTON HERD REGISTERED YORKSHIRES

DO YOU KNOW

That the Yorkshire Hog produces more pounds of growth for feed consumed than any other? That the Yorkshire is more prolific, hardy, and prepotent than our native breeds?

We have some choice gilts, open and bred.

GREAT MONEY-MAKERS.

LLOYD & TOINTON,

R. F. D. No. 1, Box 402, SANTA ROSA, CALIFORNIA
San Francisco Address: P. O. Box 2250

Hampshire Swine

We are offering three fine boars, whose direct ancestors were of such correct conformation that they won Grand Championship honors. These three boars are long, deep, with well-arched backs and strong, heavy bone—they are a credit to the grand champion blood that produced them.

GENERAL ALLEN'S COUNTERPART 64733. Sire General Allen 1061 (the undefeated Grand Champion). Dam, a daughter of High Roller 5279 (a Grand Champion boar). General Allen is now dead, so this is probably the last opportunity to get one of his sons.

DRAPER LADDO 69927. His sire Draper Lad, both grand sires and all four of his great grandsires were grand champions. In this boar is combined the blood of Hawkeye Lad (the greatest son of Cherokee Lad). General Tipton (Grand Champion from New York to Missouri) and Lookout (the \$5000 son of Blythedale Jim).

TIPTON SENATOR. Sired by Young Senator (Grand Champion), who was by The Senator (Grand Champion). His dam was Tipton's Missle (Grand Champion), she by General Tipton (Grand Champion).

A few big roomy arch-backed sows and gilts of choice breeding for sale. They are bred for October and November litters.

Weanling pigs of Good Type and Richly Bred.

For full information, in regard to these animals, write to

THOMAS T. DINSMORE, Manager.

Better yet, visit the ranch and see the animals themselves.

Along the California Livestock Trail

[Written for Pacific Rural Press by Thos. F. McConnell.]

Charnock Feeding Methods.

Some successful swine raisers say that they can't grow hogs well unless they slop them, but Chas. H. Tyler, manager of Charnock Ranch at Hemet, is a firm believer in dry feed and all of the Duroc-Jerseys at this ranch receive concentrates in dry form. Plenty of clean, fresh water is accessible at all times in covered troughs with only drinking space open. Cement feeding floors are used so that waste of feed is reduced to the minimum.

There are dirt floors in the farrowing pens and Mr. Tyler claims that if a sow is taken with milk fever the removing of the old earth and replacing it with fresh wet earth so as to form a mud bath, will quickly cure such a case. The pens are cleaned regularly and the dirt floors are sprinkled lightly with crude oil on the top of which bedding is used.

At present the ranch is carrying 700 head of Durocs, but registration is kept up on only the best of the females, and only a very few of the males escape the knife. From the senior herd sire, Cherry Friend, down to the smallest suckling pig, great size and excellent quality predominate.

Cook Had to be Shown.

It is interesting to know that very many of our breeders of registered livestock have first thought that grade animals were "just as good" and that the registered stuff was a fad to be indulged in by a few who wanted a hobby to ride.

Among such is J. H. Cook, the Poland-China breeder of Paradise, who first started as a boy in a small way with a cheap pig or two at a time of no particular breed. After a rather long feeding period the pig or pigs would be sold and a margin of profit was made possible by the low first cost. However, Mr. Cook, being a reader of the Pacific Rural Press, had noticed an advertisement of a local breeder of Poland-Chinas and mentioned his longings to his mother, who, being a lady of unusual foresight, encouraged her son so much that he commissioned her to buy him two pigs at this breeder's on her next trip to Chico. So upon Mrs. Cook's return she brought two weanling Poland-Chinas, but when the price of \$45 for the two was mentioned the young breeder, who had been paying from \$2 to \$3 apiece for grade pigs, was in the depths of despair by this load of debt.

After thinking it over, however, he concluded to try them out and put them in a pen with a few grade pigs. Much to his surprise and gratification the pure-bred pigs rapidly left the grades behind in growth. The difference was so marked that he thought the pure-breeds must be robbing the others and separated them, but the difference still existed; in fact, was more marked after separation than before.

Mr. Cook gives the Pacific Rural Press credit for getting him started on the right road in the pig game, both through its reading columns and its

SWINELAND FARMS

Tamworths and Durocs

The two great breeds of swine. Tamworths are the greatest bacon hog in the world today. They are the largest breed, combining great length and depth with exceptionally strong backs. The best gleaners and grazers of grain fields. The hams and bacon have a very large percentage of lean, juicy, sweet-flavored meat and bring a premium over the same meats of other breeds.

W. O. PEARSON,
Woodland, Calif.

Ranch 2 miles west and south of Yolo.

advertisements of high-class stock.

Polands at Peake's.

The last of the grade Poland-Chinas at the ranch of H. B. Peake, near Riverside, have been sold to make room for the increase of registered stock. The blood lines of these animals represent the best herds of California and the corn belt, and included in the pedigrees are found the names of Blue Valley, I. B. A. Wonder, Superba and Big Orange.

Three herd sires of the popular big type indicate progress. The senior sire, Greenfield's Special, shows his Superba breeding in size, vigor and prepotency. Peake's Blue Valley Model, who is just coming into service, ought to leave a good lot of stock, and H. B. Superior Giant, a line-bred boar sired by Superba, promises to become a corker. Mr. Peake will show at the Riverside Fair and has a litter from Greenfield's Big Sis 2nd that will furnish lively competition in the futurity classes.

Durocs at McMillan's.

Ray McMillan of Ethanac certainly has some dandy good Durocs and lots of them. The herd sire is Crescent Prince by Great Pathfinder, out of a Prince Albert sow.

Mr. McMillan feeds his hogs alfalfa and grain, and supplements the grain ration with a small amount of prepared buttermilk which he likes very much. Mr. McMillan is new in this State. He has raised Durocs for years back in Iowa and he brought his herd with him, so we really have a whole Eastern herd transplanted to California.

Durocs' Delight.

The above ought to be the name of the ranch of F. D. Burr Co., located at Orland, for Mr. Burr and his herdsman, Mr. Jerome, aim to make things as comfortable and sanitary for their hogs as possible. The latest addition is a cement-lined irrigation ditch that forms the division between the alfalfa pasture and the various feed lots. It certainly is a plunge de luxe for the happy Durocs. This ditch is large enough for all of the 300 hogs and pigs to bathe at once. Fresh water is passed through the ditch at least once every 4 days and it is so built that about 10 inches of water remains in the bottom for wallowing when the water is not running.

Mr. Burr purchased a gilt at the last Tulare Duroc-Jersey sale, bred by Joe Chinoweth of Visalia, that is a beauty and is of the type that gives excellent results for the feed consumed. However, she is not the only good one in the herd, as there are 250 spring pigs that are a great lot of youngsters, hard to beat as a whole or individually.

Hollingshead Herd Headers.

With the exception of tankage, Hollingshead & Sons of Orland raise all the feed for their Duroc-Jerseys. Ground barley and milo maize, with alfalfa pasture, make an ideal ration in combination with a small amount of tankage. In order to make up for the lack of alfalfa at present they are trying cow pea pasture in a small way. The grain is fed in the form of a slop twice a day, with plenty of water to drink.

Their senior herd boar, Sammy King's Col., traces back to King's Col. and Golden Model on the sire's side, and to Cherry King Orion on the dam's side. He is fully as good an individual as his breeding warrants and gets fine pigs. Along with this boar is a line-bred Defender boar that will be a year old in September and promises great things as a sire if he reproduces himself reasonably well.

Hog Husbandry at Rancho Del Sur.

Donald Graham, proprietor of the above named ranch at Lancaster, likes to use a self-feeder for certain phases of his swine business, but he found that the wind and birds get more of the feed than the hogs. In order to overcome this he had the students of the manual training department of the Lancaster High School make a self-feeder after a design of his own that is a pronounced success. This feeder

The Hampshire Hog

The Hampshire has become America's most popular hog by sheer force of merit. At the 1918 International he won Grand Championship over all other breeds, and sold for \$2.25 per hundred above his nearest competitor. And when it comes to high dressing percentages the Hampshire is in a class by himself. The picture below tells the story.

Chilled Fat.
300 POUNDS.

Chilled Lean
129 1/2 POUNDS.

Chilled Bone
29 1/2 POUNDS.

IDEAL FOR CALIFORNIA CONDITIONS

The Hampshire is a natural foraging, green feed hog, and thrives particularly well on California's alfalfa and other succulent grasses, therefore requiring less grain than other breeds. Send for free information about the progress of the breed and its adaptability to California conditions.

has the ordinary arrangement of hopper with adjustable feed slot at bottom opening into a shallow tray or trough that extends horizontally, so as to meet a perpendicular line dropped from the upper outward edge of the feed hopper. From this edge are hung on hinges and opening inward a system of doors extending from one end to the other of the feeder. When the hogs are not feeding these doors rest at the bottom against the outer

prevent litter, wind or birds from disturbing the contents of the feeder. When the hog wishes to eat he comes up and simply pushes in on the lower end of the swinging door and at once has full access to the feed.

If you are dehorning any calves or cattle this season, be sure you do not allow the flies to deposit their eggs in the wound. Use a protection of some kind—either a covering or a

Keep the Hogs Cool

Written for Pacific Rural Press.

Every time a hog gets too hot he pants away a good lot of meat. And a hog gets hot very easily. During the summer special care should be taken to have the hog quarters well shaded. If no natural shade is available a very good shelter can be made of boughs placed about 4 feet high, or if there are no trees from which boughs can be cut, make a framework and cover it with straw. If there are several fields in a row such a framework can be built over a dividing fence, using the fence for a center prop and having half of the shelter on one side of the fence and half on the other, thus protecting the hogs in two fields with one shelter.

All hog raisers know the value of fresh, clean water for their animals to drink during the hot weather, but here is a difference of opinion as to the value of wallows. Some breeders have concrete wallows, others merely provide shade and fresh water to drink and claim that wallows are not necessary. Experiments are being carried out at the experiment farm of the Department of Agriculture at Beltsville, Md., to determine whether or not a good "swimmin' hole" reduces feed bills. At present there is no concrete wallow with a covered frame from which it provides shade. It has been noticed that during the heat of the day the hogs do not get in the water, but prefer to lie around the edge of the pool in the shade. Another pool has just been built in an adjacent hog lot, but the shade will be provided several yards away. Hogs are to be kept in both lots and it will be noted whether they prefer to get in the water or lie in the shade during the heated part of the day. Weights will be kept to see which lot of animals makes the most economical gains.

Probably the majority of California breeders favor wallows, but wallows should not be allowed unless they are

kept sanitary. A permanent mud wallow with stagnant water is a great breeding place for disease germs and will do more harm than good. Better no wallow at all than a filthy one.

SUCCESS SECRETS FOR SWINEMEN.

Cultivate an interest in your hogs and give them more than passing attention.

Careless methods cause failure even though royal blooded stock is selected. In fact, blood lines mean nothing without good care.

Kind treatment causes contented, gentle, docile hogs. The hogs are responsive, and return your kindness in like kind.

The breeder who cares for five brood sows in the best shape with right feed and exercise, will make more money than the one with ten brood sows neglected or improperly handled and fed. The man who is a poor feeder can never become a successful breeder.

Pure-bred breeders have had it proved that immunizing against cholera not only saves the herd, but adds many dollars to the selling value of the hogs. Buyers for hogs not immunized are limited nowadays.

HAMPSHIRE BREEDERS ORGANIZE.

The Hampshire breeders of this State are determined to put their hogs to the front in a big way and are willing to pay the price. This was proved at the get-together meeting held at the Underhill sale at Santa Barbara, August 6, when it was proposed to make the dues of the California Hampshire Swine Breeders' Association \$1 per year. The plan was ridiculed; the fee was set at \$5, and the way the money was shelled out by the dozens of breeders who joined shows what may be expected when the funds are used along promotion lines.

The officers elected were: F. V. Gordon, Los Angeles, president; Francis T. Underhill of Santa Barbara, L. A. Denker of Sangus, H. Braly of Los Angeles, W. S. Morton of Gardena, and F. J. Costello of Los Altos, vice-presidents, and C. J. Gilbert of Lancaster, secretary-treasurer. These officers will form the executive committee.

It was decided to hold a banquet at Los Angeles October 20 during the Livestock Show, and to have a special show of Hampshire hogs on the 21st. Keep your eyes on this live bunch. Or, perhaps, we should say, keep your lamps on the Hamps.

POLAND-CHINA BREEDERS—GET BUSY!

Here is a chance to develop foreign trade. The acting director of agriculture at Manila, Philippine Islands, sends to the Poland-China Journal a list of swine breeders in the Philippine Islands who are prospective purchasers. But why should they buy from corn-belt breeders when they can secure just as good stock here in California and save the cost of expressage half-way across the continent? California breeders should get after these prospects with some forceful business-bringing letters. The list is as follows: W. C. Hart, Camp Stotsbug Angeles, Pampanga, P. I.; Alfonso Tuason, Bureau of Agriculture, Manila, P. I.; Charles Mitschek, Trinidad Stock Farm, Baguido, Mt. Province, P. I.; Carlos X. Burgos, Alabang Stock Farm, Alabang, Rizal, P. I.; Dr. Vincente Ferriols, Bureau of Agriculture, Manila, P. I.; Dr. Frank C. Gearhart, Sta. Mesa Dairy Farm, Manila, P. I.

To drive hogs, use a piece of garden hose eighteen inches long, mounted on a twelve-inch length of broom handle. This smarts when applied, makes a noise, does not bruise or injure the hogs, and is much better than a whip or stick.

OAK KNOLL Chester Whites

The Breed Progressive Farmers Want

Large Litters--Quick Maturity Easy Feeders--Top Prices

AT the Chicago International, 1918, this breed again won over all breeds on carcass tests. Either straight bred or crosses, the Chester White has for six years proven superior to all other breeds in Open Competition at these Internationals.

Doings in the Swine World

Written for Pacific Rural Press.

Poland-China prices are again skyrocketing. Wm. Wrigley, Jr., of Lake Geneva, Wis., the millionaire chewing gum man, recently purchased from Silver Brook Farm, Muncie Ind., for \$15,000, the sensational boar, The Mansman. This was a record price for the breed, but it held for only a few days, as on August 8 at the Halard-Hassler sale at Manning Ia., the boar Mabel's Jumbo was purchased by H. W. Hey for \$18,000. What will be the limit be?

W. S. Morton, the veteran Hampshire breeder of Gardena, has an attractive sign out in front of his ranch with suitable wording on it and a picture of a Hampshire hog. He says that it brings him lots of business. How many pure-bred hog breeders are making this simple means of letting assessors know about their stock?

El Dorado county Durocs are replacing gold mines. There is a live Duroc breeder's association and just as many a Duroc pig club. Twenty-five pig club members began their work with an investment of \$650 and in the year they have sold \$650 worth of Durocs for cash, have on hand \$1,200 worth of young stock and the original sows which they now value at \$600. Not many producing mines excel that record.

Swine breeders in the Newlands irrigation project, Nevada, are making co-operative shipments of hogs to San Francisco. A representative of the U. S. Department of Agriculture arranges with the farmers to deliver their surplus porkers on a certain date, so that the animals can be shipped in carload lots. The total shipping and marketing expenses range

from 1 1/4 to 1 1/2 cents per pound, so the producers realize a much greater net income than when selling hogs locally.

Young & Clark of Lodi have a pig sired by Golden State King and out of Bob's Smooth Model that gained 22 pounds in 7 days. This is a very promising April gilt and she looks as though she will continue to make very rapid gains.

J. E. Steely of Clements is one of the new Poland-China breeders who has recently gotten into the game, but does not expect to show this year. He will have 3 young boars in the coming sale at Lodi, Sept. 19th.

Geo. V. Beckman & Sons of Lakeside Stock Farm, Lodi, have recently made some additions to their herd that will materially strengthen an already strong herd. Their young boar, Lakeside Defender, is a crackerjack and will have to be reckoned with in the show ring this fall.

Loma Rica Ranch near Grass Valley has sold 2 classy Berkshire hogs to the Gossard Breeding Estates, Indiana, according to a report. The animals were Loma Rica Leader and Loma Rica Belle, both raised on the ranch. Representatives from the East came out to pass on the animals and bought them at high prices.

W. O. Pearson raises a large number of market hogs in addition to his registered Durocs and Tamworths. He has 1,600 at his Maxwell ranch and 1,600 at the Orland ranch. It is a pretty good proof that his registered hogs are money makers when he can make a good profit from those sold for market hogs.

J. E. Thorp of Lockeford will show 14 head of Durocs, including a junior yearling boar that is a crackerjack, 2 aged sows, a junior yearling sow, 9 futurity pigs and a senior sow pig.

Tagus Ranch, Tulare, will show 7 head of Durocs sired by California Defender.

Henry Cummins, Visalia, will exhibit a Duroc-Jersey junior yearling and a senior sow pig on which he is willing to bank his last dollar.

Hale I. Marsh of Modesto, who is always one of the big winners with his Poland-Chinas, will show 10 head, including a senior yearling boar by Model Major and a half sister to the grand champion sow of 1917.

Mark Bassett, the veteran Poland-China breeder of Hanford, will show his usual large herd. This will consist of 35 head, including a futurity litter by Kings Timm out of a Model Fellow sow, and the senior yearling boar Kings Gerstdale Jones. Most of the stock will be sired by Model Fellow. Mr. Bassett has also entered 6 very fine barrows to compete against all breeds.

John M. Bernstein of Hanford, whose boar President has made him famous, will have a fine show herd of 11 head of Poland-Chinas, including the outstanding junior yearling sow, Carrie Hadley.

C. A. Vaughan of Hanford has entered 12 head of Poland-Chinas and expects to do well on his first appearance in the State Fair show ring.

H. D. McCune of Lemoore will show a great herd of Poland-Chinas headed by Kings Massive Orange. It will include a futurity litter by this boar; also an October boar pig, McCune's Buster, by the great Eastern boar, Giant Buster.

W. L. Haag & Son of Lendorris Ranch, Hanford, will show 12 head of Poland-Chinas. The great sire Long Jumbo will be shown again; also a futurity litter sired by him and out of Lorraine B. The sensational Eastern boar, Lendorris Liberty Bond, will also be shown and ought to prove the center of attraction.

W. T. Dice of Hanford will show a great Poland-China futurity litter of late March pigs by Dice's Orphan. He will also exhibit a junior sow pig, a junior yearling sow and 2 March

pigs out of a litter of 16 sired by Big Knox Boy. He is making a great hit with his "Right-Type" Polands.

Elmer Lamb of Ceres has reduced his herd considerably during the last year, but has kept up the quality and will show a small herd of very high-class Durocs.

Cross Brothers of Merced will show what good breeding can do in a Poland-China futurity litter by President out of Long Letty, and 2 Rosebud gilts by Long Jumbo.

Jack Borge of Dos Palos will show 16 head of Durocs featuring the get of his great sire Russell Orion Boy. If you want to see big, high-backed hogs, be sure to look over this exhibit.

A. Buckland & Sons, Fresno, will be out with a great Poland-China show herd this year consisting of 15 head, including their two great herd boars, Blue Valley King and California Jumbo Buster. They will also show a futurity litter by Jumbo Buster.

J. Francis O'Connor of Castleview Ranch, Santa Rosa, who probably has more world champion Berkshires in his herd than any other coast breeder, will have a great herd at the State Fair this year and expects to win his share of the blues.

Greenwood Farm, Live Oak, will prove the breeding ability of their great Duroc sire, Johnson's Defender Jr., by showing at the State Fair some of the finest pigs ever exhibited. Be sure to look them up.

To merely say that A. B. Humphrey of Grape Wild Farm will be on hand with his Berkshires is the same as saying that he will win a good share of the ribbons, for Mr. Humphrey's Berkshires are known throughout the country and he always gets his share of the awards. The younger entries this year will be sired by Big Leader, the greatest son of Grand Leader 2nd.

Geo. V. Beckman & Sons of Lakeside Farm, Lodi, will be out with a great show herd this year and expect to capture a big lot of ribbons, especially in the younger classes.

Diamond Bar Ranch, Spadra, will have a great show herd out this fall, and will make all of the shows, starting at the State Fair. Walter T. Gatton, superintendent, says that they may possibly send a few head back to the National Swine Show at Des Moines. A great bred sow sale will be held at the Diamond Bar Ranch in January.

Poland-Chinas lead in the number of entries this year at the State Fair, there being 295 head entered.

The Boys' Pig Club will exhibit a large number of registered hogs this year, and the entries on the whole are double those of any previous year.

STATE FAIR JUDGES.

The list of judges in the livestock division this year includes some of the leading men in the United States. The judges are: John C. Burns, College Station, Texas, draft horses and beef cattle; E. A. Trowbridge, Columbia, Mo., horse show; Hugh Van Pelt, Waterloo, Iowa, dairy cattle; James F. Wilson, University Farm, Davis, sheep and goats; Guy C. Putnam of Tecumseh, Neb., Thos. A. Shattuck of Hastings, Neb., Wynan Lovejoy of Roscoe, Ill., and Prof. J. I. Thompson of University Farm, Davis, hogs; R. V. Moore of Oakland and W. S. Russell of Concord, poultry.

ELDERSLY FARM BIG TYPE POLAND CHINAS

Possessing wonderful length, splendid depth of body, high-arched backs, good feet and worlds of quality. The kind that will put quality into your herd and convert high-priced feed into profit.

BLACK BIG BONE WONDER, our senior herd boar, is a great individual with the most wonderful back you ever saw. He has the blood of grand champions from both sire and dam. In **JUMBO BUSTER**, a young boar of much promise, he has an able assistant.

Remember this Herd when you buy Polands.

EL PROFITO HERD

Big Type Poland Chinas

They have the size, bone, stretch, spring of ribs, heavy quarters, smoothness and mellowness found in easy-feeding, money-making hogs.

EL PROFITO, our great herd boar, stamps his offspring with his superior qualities. To make the right start get one of his pigs.

Inspection or correspondence invited.

VIOLA L. RENWICK,

Santa Barbara, Cal.

Why Not Stallion Associations?

Written for Pacific Rural Press.

For some time the Government has been recommending co-operative bull associations for dairymen who would like to use pure-bred bulls to improve their herds, but who cannot afford to purchase such animals alone. Considerable literature has been issued on the subject, and Government agents have even been instrumental in forming such associations.

But why not a similar association for farmers who want to breed up their horses? And why not Government or State aid? Valuable suggestions along this and other lines were made by President White at the last annual meeting of the Percheron Society of America.

He referred to the horse situation in Europe where, according to information he has recently received from members of the Agricultural Commission sent to Europe to study the situation respecting livestock and farm products, there is a great shortage of work horses, the balance of which cannot be restored except by the shipment of large numbers of horses from this country. He cautioned breeders, however, not to expect too sudden a response in values on account of the fact that ship space will not be available for ready exportation of horses before spring, and even if there was available space at the present time it would not be advisable because of the lack of grains and forage for horses over there.

The need for intelligent action on the part of individual breeders in eliminating unsound horses and those of faulty conformation was specially dealt with. Breeders were urged to weed out rigorously and castrate the inferior stallions and to sell the mares of inferior character as grades to the end that the standard of the breed might be steadily improved. The President emphasized the fact that in America the Government cannot do

the thinking for individual breeders and that it would be undesirable if this were to be attempted, as it would merely tend to hamper the initiative and study of livestock breeding now characteristic of our American breeders. Not every farmer or stockman is competent to become the breeder of pure bred livestock. Those who do should first become cognizant of the desired types of animals they expect to breed and familiarize themselves with soundness and blood lines. Those who fail to safeguard themselves with this preliminary preparation are certain to suffer financial loss early in their career as breeders of purebred livestock.

State aid in the form of subsidies to a limited number of high-class stallions, to be approved by the stallion boards, was urged. The need for this grows out of the fact that no one farmer owns enough mares to justify keeping a stallion for his own use, and farmers are too busy to stand stallions for public service. A good sire worth using should have the mares from at least twelve or fifteen farms and this requires that some State aid be given to men who are to purchase and stand such stallions for public service in order that the attention of the farmers may be sufficiently concentrated on these particular good sires to make certain their general use. Mr. White says ample justification for State aid is found in the fact that when any particular State produces a surplus of high-class horses the wealth accruing to the farmer who produces and sells such horses is distributed in the form of purchases to merchants, wholesalers, and so on throughout the entire State.

Should we have State aid here in California?

Ewe's milk is much richer in fat and casein than cow's milk and contains 7 per cent less water.

WAIT FOR THE TREWHITT-VAUGHAN SALE

Of Registered, Big-Type

Poland - Chinas

Wise farmers will wait for this great opportunity to get breed improvers at their own prices. We will drive into the sales-ring the greatest lot of Poland-Chinas ever offered in California. There will be foundation sows and gilts sired by the breed's most noted boars, and bred to boars of the same caliber. Also some outstanding herd boar prospects.

52 Bred Sows and Gilts---a Few Boars

Trehwitt Consignment

Vaughan Consignment

W. D. Trehwitt will sell 40 of the finest sows and gilts he has ever offered, purchased on his recent trip to the Corn Sired by Big Ben, Jumbo Equal and MyBelt. The Poland-China Journal said that Choice, and out of Jumbo Nell, Queen Wonder 2nd, Miss Jumbo Wonder, Anona Wonder and Jumbo Dairy. Bred to Model Jones, the great Missouri boar of Gerstale Jones breeding, and Iowa Wonder, the Iowa boar by Big Long Wonder.

C. A. Vaughan will offer 12 bred gilts purchased on his recent trip to the Corn Sired by Big Ben, Jumbo Equal and MyBelt. The Poland-China Journal said that Choice, and out of Jumbo Nell, Queen and bought only the very best, and that there were many future prize winners in the lot. They combine extreme size and quality and represent the last word in Corn Belt breeding.

Special Livestock Market Report

Written for Pacific Rural Press.

San Francisco, Aug. 20, 1919

CATTLE—There is a feeling of nervousness and uncertainty in the livestock market both here and in the East, though in the latter markets the feeling is more pronounced and has resulted in the development of a most erratic market. This abnormal situation is induced by the Government's drastic action in investigating the "high cost of living," accentuated by its seizure of meats in cold storage. The strike troubles in the packing houses and on the railroads are also a complicating factor. Buyers are therefore marking time, and taking on supplies for immediate needs only. Of course, this has a bearish effect on the market and the trend of prices is downward. Cattle are plentiful, except as to the choice grades. Calves are scarce. Quotation follows:

GRASS STEERS—
No. 1, weighing 950 to 1100 lbs. 10@10 1/4 c
No. 1, weighing 1100 to 1300 9 1/2 @ 10 c
Second quality 8 @ 8 1/2 c
Thin 6 @ 7
Cows & Heifers, No. 1 8 @ 8 1/2 c
Second quality 6 1/2 @ 7 1/2 c
Common to thin 4 @ 5 1/2 c
Bulls & Stags Good 5 @ 6
Fair 4 @ 5
Thin 3 1/2 @ 4

CALVES—
Lightweight 12 1/2 @ 13 1/2 c
Medium 12 @ 12 1/2 c
Heavy 10 1/2 @ 11 1/2 c

SHEEP—The mutton sheep market is on a healthy basis, although a slight decline in local quotations is noted. Quietness in the wool market and the feeling in wool circles that the price wave has reached the crest, prompts growers to show less indifference about parting with stock. Even in the sheep trade buyers are in a waiting attitude.

LAMBS—
Yearlings 10
Milk 12 @ 13 c
Sheep Wethers 8 1/2 @ 9 c
Sheep, Ewes 6 1/2 @ 7 c

HOGS—While the hog market has manifested a decidedly erratic tendency in the Eastern markets from the same causes, affecting in some measure other lines of livestock, locally the market has eased off a little during the week and a decline of \$1 a hundred is announced by packers. The highest price paid for prime, grain-fed hogs weighing from 150 to 250 pounds, is now \$19.50 per cwt.

Hard, Grain fed 100 to 150 19
Hard, Grain fed 150 to 250 19 1/2 c
Hard, Grain fed 250 to 300 19 c
Hard, Grain fed 300 to 400 18 1/2 c

DRESSED MEATS—
Steers No. 1 14 @ 15 c
Second quality 13 @ 14 c
Cows & Heifers 11 1/2 @ 14 c
Calves as to size etc. 21 @ 25 c
Lambs, Suckling 22 @ 23 c
Lambs, yearling 20
Sheep, Wethers 16 @ 18 c
Sheep, Ewes 14 @ 15 c

BUTTER.
All grades of butter showed a remarkable steadiness during the past week. Since Monday week there has been a change of only a half cent in extra butter, while prime firsts and firsts show no fluctuation during that period. While all the local dealers proclaim that the "H. C. L." investigation cannot touch the local butter market, there is certainly not the demand or interest in butter that is usually shown. The local storage movement showed an excess of 70,000 pounds in the movement out of storage over the movement in. The large Eastern centers showed that the movement of butter into storage had not stopped, as the reports show an excess of a million and a half pounds over the reports of a week ago.

Th. Fri. Sat. M. Tu. Wed.
Extras 53 52 1/2 52 1/2 53 52 1/2 52 1/2
Prime firsts 52 1/2 51 1/2 51 1/2 51 1/2 51 1/2 51 1/2
Firsts 52 50 1/2 50 1/2 50 1/2 50 1/2 50 1/2

WOOL.
The local wool market is quiet, as is usual at this season of the year, though the price situation is strong and the small lots traded are held at extreme prices by sellers.

Humboldt 52 1/2 @ 60 c
Mendocino 50 @ 57 1/2 c
Sacramento 45 @ 47 1/2 c
San Joaquin 42 1/2 @ 47 1/2 c

HIDES.
The hide market is somewhat unsettled following the rapid advance in prices of the past weeks. Country hides are in active demand at good figures.

Wet Salted:
Steers 37 @ 42 1/2 c
Cows 35 @ 37 1/2 c
Kips (15 to 30 lbs.) 60 @ 70 c
Bulls 20 @ 25 c
Horse Hides:
Large 7.50 @ 10.00

Small 6.50 @ 7.50
Medium 5.50 @ 6.50
Colts .75 @ 1.25

CHEESE.
The market was dull, with very little change in prices. Almost no Oregon product was traded in and the volume of trade in California was not enough to affect prices. The demand was somewhat lighter than the previous week. Fancy California, flats per lb. 32c
do, Firsts 30 1/2 c
Oregon Triplets 32c
Oregon Y. A. 33c
Monterey cheese 24 @ 25c

HAY.
Receipts of hay for the past week were 2818 tons compared with 2727 the previous week. Most of this hay is coming in by boat and arrivals by rail are lighter than they have been for years. Cars have been very difficult to obtain in most sections and box cars are practically unobtainable for hay. Alfalfa is the leader in the market, and commands the best price of any hay. With better shipping facilities it might command even a better price. Several large lots of alfalfa changed hands during the week at prices in excess of quotations. There is no demand for straw, with large offerings.
No. 1 Wheat, per ton \$15.00 @ 18.00
No. 2 Wheat, per ton 12.00 @ 15.00
Choice Tame Oat, per ton 15.00 @ 18.00
Wild Oat, per ton 10.00 @ 14.00
Barley, Hay, per ton 12.00 @ 16.00
Alfalfa, per ton 17.00 @ 22.00
do, new, 1st cutting 9.00 @ 12.00
Stock Hay, per ton 9.00 @ 12.00
Barley Straw, per bale .50 @ .80

FEEDSTUFFS.
The market was very dull with a marked falling off in demand earlier in the week.
Bran Not being marketed
Shorts Not being marketed
Cracked corn \$79.00 @ \$1.00
Rolled barley \$68.00 @ \$7.00
Rolled oats \$64.00 @ \$6.00
Alfalfa meal \$36.00 @ \$7.00
Cocoanut meal \$48.00
Oil cake meal \$72.00 @ \$7.00
Millmex \$59.00 @ \$6.00
Millrun \$49.00 @ \$5.00

Los Angeles, Aug. 19, 1919.

CATTLE.
Per cwt. f. o. b. Los Angeles:
Beef, steers 1000 @ 1100 lbs. \$11.50 @ 12.00
Prime cows and heifers 9.50 @ 10.00
Good cows and heifers 9.00 @ 9.50
Canners 4.00 @ 9.50
Per cwt. f. o. b. Los Angeles:
Heavy av. 270 @ 350 lbs. \$16.00 @ 17.00
Heavy av. 225 @ 275 lbs. 17.50 @ 18.00
Light 19.00 @ 20.00
Rough docked 20 lbs piggy sows 40 per cent

SHEEP.
Prime wethers \$8.50 @ 9.50
Prime ewes 8.00 @ 8.50
Yearlings 8.50 @ 9.50
Lambs 13.00 @ 15.00

ALFALFA HAY.
The Alfalfa Growers of California, Inc. 525 Central building, Los Angeles, furnish the following quotations on alfalfa hay which are selling prices to purchasers of carload lots, f. o. b. Los Angeles.
The grower to arrive at his selling prices f. o. b., his station should deduct the carload rate of freight from quotations below:
No. 1 dairy \$27.00 @ 28.00
Standard dairy 24.00 @ 26.00
Standard alfalfa 21.00 @ 23.00
Stock alfalfa 17.00 @ 19.00

BUTTER.
Creamery extra. Produce Exchange price, 56c lb.; price to retail merchants, in 1-lb. squares, 62 @ 64c.
CHEESE.
California 34c; Wisconsin dairies 42c; Wisconsin twins 36c; Wisconsin long horn drums 40 @ 42c singles, 36c; Tillamook triplets, 41c; Coos Bay triplets, 39c; limburger 33 @ 35c; cream bricks, 42c; block Swiss, 45c; wheel Swiss 55c.

Portland, Ore., Aug. 19, 1919

CATTLE—Steers, best, \$11.25 @ 11.75, good to choice 10.00 @ 11.00; medium to good, 9.00 @ 10.00; fair to good, 7.50 @ 8.50; common to fair, 7.00 @ 7.50; good to choice cows and heifers 8.00 @ 9.00; medium to good, 7.50 @ 8.00; fair to medium 6.00 @ 7.00; canners, 4.00 @ 5.50; bulls 6.25 @ 8.00; calves, 10 @ 15.
HOGS—Hogs steady; receipts none. Prime mixed, 20.00 @ 20.50; medium, 19.50 @ 20.00; rough heavy, 19.00 @ 19.50; pigs, 18.50 @ 19.00.
SHEEP—Sheep steady; no receipts; East Oregon lambs 12.00 @ 12.50; valley, 11.00 @ 11.50 fair to medium, 9.00 @ 10.00; yearlings 7.00 @ 8.50.

"In the grease" denotes the fleece as it comes from the sheep's back. A hundred-ounce fleece will contain about 17 ounces earth and sand, 8 ounces manure and dirt, 14 ounces fat, 13 ounces water, 5 ounces potash, 8 ounces sheep oil, and 35 ounces pure wool fibre.

BUY BERKSHIRES

Our Anchorage Farm Berkshires are money-makers. They are strong in the blood of our world's reserve champion, Star Leader, and have size, type, quality, vigor and easy-feeding qualities.

BRED GILTS WILL START YOU RIGHT

We offer a choice lot of gilts, like those shown above, bred to the great Star Leader, to his splendid son, Anchorage Leader 2nd, and to our new boar Champion Value 10th, from the E. J. Barker herd at Thorntown, Ind.

These gilts have good bone, well-sprung ribs, strong backs and heavy hams. They are right in every way, and all ready to go ahead and make money for you. Order quickly. If you want further information, send for free illustrated booklet.

calco products

Model 100

Calco Automatic Drainage Gate

A sensitive, reliable, water-tight Cast Iron Drainage Gate, automatically controlled. It will convert your flooded land into fertile fields. Diameters from 8 to 84 inches. Write for price lists.

Model 252

Calco Automatic Hog Watering Fountain

Constant fresh water, without overflow. Connects to water supply pipe—works automatically. Built of Armco galvanized iron and cast iron. Specifications and prices on price list. Write for one.

Model 150

Armco Iron Lateral Headgates

Easily operated, durable metal gates—diameters from 8 to 36 inches. Hand or screw lift provided with either type of bulkhead. For heads of water up to 6 feet.

Model 153

Model 101

Calco Slide Headgate

Water-tight, Cast Iron Gate for reservoir or levee work. For use under heads of water up to 20 feet. Diameters from 8 to 72 inches—gate frame any height required.

Model 161

Armco Iron Irrigation Gate

An inexpensive, reliable metal irrigation gate. Diameters from 8 to 15 inches. Furnished with or without bulkhead. Write for price list.

Model 244

Calco Hog Troughs

Calco Hog Troughs help you raise healthy hogs. They are sanitary, strong and durable. Built of Armco galvanized iron with cast iron ends. Lengths from 24 to 120 inches. Get our price list

Model 251

Calco Hog Watering Tank

Gives the same service as the Calco Automatic Watering Fountain, where water must be carried or hauled. Easily moved about for your convenience. Strong, durable, sanitary. Get capacities, weights and prices from our price list.

Model 250

Calco Automatic Grain Feeder

Gives plenty of feed—without waste. Clean and sanitary. Bin of galvanized iron, trough of cast iron. Capacities from 2 to 10 bushels. Write for price list.

We manufacture a complete line of irrigation gates and hog specialties. All gates are supplied with any length of Armco Corrugated pipe, when required.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

AUGUST 30, 1919

LOS ANGELES

Experts Discuss Best Type of Big Prune

Written for Pacific Rural Press.

MOST IMPORTANT gathering for improved cultural methods as applied to the California prune industry was held at Leonard Coates' home at Morganhill, August 21. It was that of a committee named by the Nurserymen at the Riverside Convention for the purpose of investigating bud-selection for the best types of prunes in regard primarily to size, quality and consistent maximum yield.

The committee served its function well in many ways. The interest shown in the matter was evinced by the presence of a large number of uninvited growers at the field conference; searching questions were presented; and the insistence of the representative of one whole county that a start be made forthwith was an earnest of the strength of growers' demands.

The chairman of the committee, Leonard Coates, Nurseryman of Morganhill, was supported by the following members of the committee: H. A. Hyde, of Watsonville; J. W. Gandy of Modesto; George C. Roeding of Fresno; A. J. Elmer of San Jose, and William T. Kirkman was represented. All these are nurserymen. Other members of the committee were Dr. J. C. Whitten, Professors E. B. Babcock and W. L. Howard, repre-

Dr. J. C. Whitten, as head of the University delegation, offered the suggestion that growers must select types and determine what they want, though the nurserymen should lead the movement.

Henry C. Holden, chairman of the Growers' Committee of the Napa County Farm Bureau, advanced definite suggestions and named a selection of desirable and undesirable prunes for consideration. He knew exactly what his growers wanted and made those wants known in a very clear and unmistakable manner. "This thing must start some time and now is the time to start—not some-day," he said.

George C. Roeding, President of the Board of Agriculture, agreed with Mr. Holden that the most highly improved types of prunes were desirable, but pointed out many pitfalls and difficulties encountered by those who would willingly carry out Mr. Holden's suggestions—the supply of just the right budwood, the willingness of growers to part with it, the men to cut it, and, above all, the records of tree performance (of those selected) carried over a period of years. This will take time.

J. W. Gandy delivered a message from Wm. T. Kirkman, President of the Nurserymen's Association, unavoidably absent, that the matter of bud-

This shows one of the groups of growers discussing the relative merits of selective types of prunes in one of Leonard Coates' experimental orchards. The inset is an illuminating comparison between an average 50 prune and a Giant French selected from a bud sport. courtesy of M. H. Gray of San Jose.

It looks like an Imperial, but it is a true French. This picture is published by the

sending the University of California; R. H. Taylor, representing the State Board of Agriculture, H. A. Dunlap, representing the Prune and Apricot Growers' Association (and who was chosen chairman for the day.) A number of non-member nurserymen were present, as well as representatives of the San Jose Chamber of Commerce and business men, and an unexpectedly large number of growers. Professor Shamel sent regrets that he could not be present, as did Professor E. J. Wickson of the Pacific Rural Press, who was, however, represented.

The questions at issue were: (1) Is the demand on the part of the growers sufficiently wide and insistent to demand special concerted action by the Nurserymen? (2) If so, how can it be met and carried out? Nothing had been definitely outlined by the nurserymen, the growers, or the scientists, but the field conference which followed a field examination of selected types of prunes, provided data and left room for a definite line of action to be pursued by these three separate bodies. The nurserymen, the growers and the scientists will doubtless each of them outline a list of suggestions and recommendations to be presented to the Fruit Growers' Convention at Chico next November from which a workable plan can be evolved.

selection will be taken up at the November Convention at Chico, and that he himself would like to see "certified buds."

Wm. Howard suggested that a group of nurserymen undertaking such work would need some safeguard on the part of the growers by growing contracts and otherwise.

Professor Babcock said nurserymen must decide if it is going to pay to propagate trees of all varieties from performance records. There must be, for this, close co-operation between the nurserymen, the Agricultural Commission and the Experiment Station.

The University of California Agricultural Experiment Station, in accordance with former suggestions, may be asked to perform all the work necessary to obtain data on tree performance on trees selected, etc.

The outcome of this meeting gives us these positive facts. The prune grower wants selected prune wood for propagation—extent of demand unknown; the nurserymen must attend to and supply that demand; it is only practicable in any degree with the aid and co-operation of trained men connected with the Deciduous Fruit Experiment Station in charge of the University of California.

EDITORIAL.

WHY WE ARE IN FOR LIVESTOCK.

OUR LAST issue was largely given to the State Fair in anticipation; our next issue will naturally be largely given to the State Fair in realization. In both these undertakings of this journal to seize the passing moment for efficient description and exhortation the animal industries figure largely, not because they are our greatest industrial activities, though they truly are now very great and will be much greater in the future, but because they are more picturesque and powerful in their expository materials and suggestiveness. An agricultural fair without ample live stock exhibits and parades of them is a very quiet and subdued affair—flowers, fruits, fine sewing, snowy bread and flaky pie-crust. Such a fair appeals to us as feminine—refined, exquisite, beautiful beyond words, except as a man may pass the descriptive task from his head and heart to his stomach, that last court of masculine resort, and declares not only the creation but the creatrix herself to be “nice enough to eat.” Quite otherwise is the attitude of a man towards a fair which is rich in animal displays. Unless he is molly-coddle, he feels all his creative endowment of power and passion rising within him as he gazes upon the lordly beasts of every kind passing before him and is apt to exclaim “They are all proud enough to fight!” And we have read in books that the feminine aspect of the case differs only in one detail, to wit, that she covers her eyes and thinks of three words to be added to the formula: “proud enough to fight for his mate!”—three words not to be spoken to save her life, but still to be thought with a thrill unknown to man. And therefore it came about that the columns of our last issue were pawed and bellowed, kicked, snorted and grunted, plunged, butted and charged and in general was made to resound with the battle-cries of all the beasts of industry. And therefore it will come to pass that our next and following issues will contain the lists of the victors in the great contests for supremacy which the fairs provide. Later still will come the propaganda for the two great special live stock shows in Los Angeles, October 18 to 25 and in San Francisco, November 1 to 8, and the achievements at these two great events. And while all these things are transpiring during the coming months, if a man does not regularly read the Pacific Rural Press he will not get the news nor the interpretations thereof which will keep him abreast of the actions and thoughts which are essential to his success with California live stock and the industries which are builded upon the animals and their functions in this State.

CALIFORNIA FRUIT INDUSTRIES.

But while this journal is laboring with its staff of expert observers and writers to adequately set forth the significance to the State and to individual producers of our live stock activities we never for a moment lose sight of the fact that our fruit industries lead all the rest and are still greatest in our outlook for fuller development, population and in every way for a richer statehood, as fruit pro-

duction has always been since it entered upon its great and confident forward movement, about forty years ago. It began to go forward seventy years ago, of course, but required about thirty years to strike its gait which has never since been slowed down except to catch new breath, now and then. This fact has been deeply impressed upon this writer, for during nearly a year past he has expended all available time upon the revision and freshening up to date of our book: “California Fruits and How to Grow Them.” As the manuscript for the Eighth Edition is now in the printer's hands and the work thereupon well advanced so that it will appear on October 1 as already announced, it may be timely to mention a few things which the fact suggests. The actual writing for the first edition began in 1885 and the book appeared in 1889. The actual start in 1885 was preceded by a decade of observation and of research to determine what had been done by pioneer growers, and the four years of actual preparation of the first edition were given to revision of all preceding operations in the light of what was currently being done and how it was being done by those, who from 1885 to 1889, transformed the experiments of the pioneers into the foundations of the superstructures of the fruit industry as we now see them in their wonderful breadth and height. But the up-building of these superstructures required much modification and extension of the foundations as well as modification of the superstructures themselves from their original plans and purposes. The California fruit industries have always gone forward though they have made many changes in points of view in methods and in products. Gains unforeseen have always exceeded losses which were not anticipated. Even the greatest producing upset, the loss of the wine and brandy product, will not change the plus sign of the grape, though it will be a sad loss and hardship to many growers of it. And thus, while always advancing, the fruit industries have been always plastic, extending into new opportunities, employing new methods, conceiving new purposes, multiplying products and developing new commercial forms and demands for them. These changes have required that our book should be seven times “thrown in and re-set” before the eighth revision and re-statement, to which we have referred, was undertaken. And the always-forward march loses no speed by advancing but is an example of wonderfully accelerated movement. Take for instance, the commercial value of the combined fruit products, which we have carefully estimated, for the year which preceded each new edition of this book for two decades, viz., 1898, thirty millions; 1906, sixty millions; 1908, sixty-nine millions; 1910, seventy-four millions; 1914, one hundred millions; 1918, two hundred and thirty-five millions. If it is realized that each of the foregoing progressive steps is not merely the measure of an annual commercial achievement but is also an exponent of the human interest involved, the time and money permanently invested, the lands, waters, systems, structures, machinery, labor, transportation and trade facilities, etc., one may calculate for himself the permanent productive and taxable wealth the fruit industries have created for the State. Such a one may calculate also what it is reasonable to estimate as the future of a going concern of such output and outfit working under natural conditions which have no rivals in America and moving toward opportunities of which even the nearest boundaries have probably not yet been approached.

FRUIT OUR GREATEST STATE BUILDER.

Five years ago when we estimated the annual commercial value of our fruit products at one hundred millions, the war had just broken out, our European outlet for cured fruits was encumbered by embargoes; buyers did not hesitate to prophesy worthlessness because of unsaleability and growers were naturally alarmed because they had to recognize at least uncertainty. But the progress of the war demonstrated that California fruits in their marketable forms are not luxuries to be rejected but staples to be built upon—a good, wholesome, nutritive foundation upon which a threatened world could work, worry and fight upon to the victory which was attained. This was demonstrable because of the inherent virtues of the products and the available volumes of them and state develop-

ment value was assured because growers, rallying to co-operative organizations which they already had and establishing newer ones as required, secured for themselves returns much nearer to their real share in values produced than would have otherwise been possible. In fact if it had not been for the growers' co-operative handling of their own products the trade-gamblers would probably have found better profiteering in prunes, peaches and raisins than in more explosive munitions and would have ruined the growers in their greed. The result has been that four years later, in the year of the armistice, our fruit products are reasonably estimated to have reached a value more than 230% greater than four years before—in spite of the fact that our oranges and prunes were both less than half the normal production.

The effect of this fortunate consummation is now visible on every hand. Fruit properties have notably advanced in value. There has arisen practically a new basis for valuation of them which buyers seem ready enough to recognize. A new interest in planting has been awakened. Improvement and planting of lands, for later subdivision into small farms of bearing trees, is being taken up in large tracts in various places. All our old stand-bys among the fruits are rated A 1—a few of them having risen from the dumps to places of honor because the growers protected themselves in the way we have cited. Other fruits which have always been of high hopes but rather of small account are now the basis of confident planting for direct profit and for land development through colonization. In fact in more ways and for more reasons than we have space to enumerate, the present enthusiasm for fruit growing as the greatest single factor in our State development because our fruit products are distinctively our own and beyond the natural powers of other American commonwealths to either successfully imitate or equal, reminds us of the enthusiasm of forty years ago. And it is surely a more reasonable enthusiasm now than then, for we are building now upon a realization of nearly a quarter of a billion annual output, while then not a full trainload of any kind of fresh or cured fruit had ever been shipped from the State! To such realization as may come upon so good a foundation as we now have, we are very glad to make our little contribution in the forthcoming Eighth Edition of “California Fruits and How to Grow Them.”

THE LIFE OF THE CALIFORNIA FRUIT GROWER.

It seems better that a disinterested observer should picture the opportunity in California fruit growing than that an admiring resident should try to film it. We find in an exchange a floating paragraph as “from a Britisher indulging in his national sport of writing to the London Times.” And this is the complimentary peal which “The Thunderer” puts forth:

“As the result of my extensive tour, and after countless interviews with Canadian and American ladies, officers, and men, and with Canadian and American bankers, doctors, lawyers, merchants, officials, tradesmen and others, and also with numerous persons engaged in California in the various branches of the fruit industry, I have no hesitation in saying to the Briton who is willing to live under a foreign flag: ‘For health, prosperity and happiness go to California and become a fruit farmer.’ California is the empire of enrichment, the land of boundless opportunity. With its diversity of resources, infinite varieties of soil, endless water supply, cheap and efficient transportation and good markets—not to mention its shooting, fishing, golf, tennis and other sports, and its pleasure resorts—California is without a peer.”

When California was new the pioneers laid many plans to secure publicity in distant journals of facts about California and the opportunity California offered to capable persons to invest capital and effort in building up enterprises which would yield profit and joy in living. We of this generation are realizing the fruits of their public-spirited efforts, for the time has come when California conditions and attainments are speaking for themselves!

ANOTHER SHY AT THE WHITE HOUSE.

We hope it will not be looked upon as a part of our lemon shipments, but nevertheless we propose to put forth as candidates for election to the presidency of the United States all the Californians who can get through the submarine zones of the local

political managers. Some weeks ago we expressed the belief that California would forego her satisfaction over her senatorial representation by Ex-Governor Johnson if he should be needed in the White House. And now, just as we are writing, there comes a cable from Paris that "Herbert S. Hoover, head of the interallied food commission, is receiving hundreds of letters from friends in the United States asking him to consent to be a candidate for the Presidency on the Republican ticket." The cable then proceeds to say:

Mr. Hoover has replied that he "preferred" not to be a candidate for office, as he has given more than five years to public life and had intended to return to California in September with his family and retire. Mr. Hoover also said that he "disliked the idea of going into politics, because he feared political life would require him to abandon certain of his principles and that he could never consent to do." The cable writer continues that certain well-informed persons, familiar with the contents of the letter, declare it is not a refusal to become a candidate, however, and that if Mr. Hoover receives assurances from the G. O. P. that he will be able to maintain his ideals and principles as a political candidate he very likely will decide to run.

That does not look so bad. Senator Johnson is reasonably busy setting forth his "ideals and principles" and we see no reason why Mr. Hoover should not also make his known. Both of the old parties are considerably shifty and Mr. Hoover might come as near being an "old line" Republican as Mr. Wilson can measure to an "all-wool" Democrat. This country ought to have a Californian for President—with or without reservations as the national convention may decide. The chief thing now is to have candidates enough and we shall not be surprised if we have a chance to endorse several other Californians, and we may be able to improve the chances of the Democratic party a little.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Not Poisonous to Sheep.

To the Editor: I am enclosing leaves of two different bushes. Will you kindly inform me as to what they are and whether or not they are poisonous to sheep.—Subscriber, Columbia.

The specimens are not adequate for identification. They can however be seen to be woody shrubs or brush and we know of no plant of that class which sheep will eat that will poison them.

Peaches on Japanese Plums.

To the Editor: I have some Burbank and Wickson plum trees which I wish to work over. Would cling peaches be all right on them, or what would you advise outside of the plum line and when?—M. W. B., San Fernando.

We should not hesitate to try a few trees for we think they would take, but we would not risk a commercial acreage of peaches because even the best results you could get would not be so good as the uniform peach orchard which you can get so quickly by starting over with good yearling trees on peach or almond roots. You can put buds in now on this year's shoots or cut back and graft next winter, wherever buds do not promise to start.

Walnut Grafts at a Stand-still.

To the Editor: I understand grafting, but have no success in top working the English walnut. I made the grafts with dormant scions, as the buds were swelling on the stock. The scions have remained green for several months, but act as though there was not sufficient sap pressure to force the buds. The trees are young and vigorous. Others experienced in grafting fail with the English walnut. Can you suggest what might be the trouble.—C. H. H., Watsonville.

We cannot do much more than guess at it without seeing the things you describe. We guess that you took scions with "blind buds"—that is with buds so undeveloped that they might not have started even in the place where they grew. You must have made a pretty good graft or else the scions would have darkened, dried and come loose long ago. Walnut scions should have buds which seem just ready to pop.

Manure-Spreader on a Rainfall Farm.

To the Editor: Does it pay to own a manure-spreader from a labor-saving and crop-benefitting point of view? I have been advised that manure is of no benefit in dry grain farming. I farm 400 acres at Linden with mules, and also have 200 head of sheep, and considerable manure accumulates

each year. The land is a heavy loam—neither sand, sediment nor adobe.—H. R. L., Linden.

You have had poor advice. We are not ready to say that there might not be land so light and rainfall so slight that one could not get manure decomposed and a crop grown with one year's rainfall. In such a case, however, all the manure a man can get ought to be worked in the summer fallow year. Farming in Linden is not dry farming, for you get a good rainfall and enough in the winter to rot fall-spread manure and keep a crop growing on it also. Get a spreader and spread every accumulation you now have in your corrals on the land you will crop next, while you have spare time this fall. After that keep the spreader handy, clean the stalls into it and start it to whizzing over the summer fallow land every time you get a load all winter.

Making Plums into Prunes.

To the Editor: Please give me a recipe to cure about 50 lbs. of plums for prunes. Would it be necessary to dry them in a dryer, or do you think the weather conditions good enough for that purpose around the bay on the north side of Redwood City? I would prefer to dry them out-of-doors.—M. E. F., Redwood City.

It is not possible to make a good sweet prune out of any kind of a plum. A plum must have as much as 15% of sugar in its juice to dry with the pit in place without souring. Plums with less sugar than that must be cut in halves and made into "dried plums," not into "prunes," and some plums have so little sugar that they do not make even decent "dried plums." If you have a plum which can be handled as a prune, dip the fruit for a few seconds only in a boiling solution of concentrated lye—two tablespoonfuls to a gallon of water. Then dip in fresh water to remove the lye and put out the fruit (in a single layer on a board tray) in the best sun you have. It ought to dry well enough in a few days. If the weather is dark or foggy cover with paper or boards until the sun returns.

A Sterile Elder.

To the Editor: After dreaming for two years about elderberry pies, I have the bush with great clusters of blossoms and no fruit! Two years ago I got from an Eastern dealer a root of the Eastern black elderberry (*Sambucus Canadensis*) and planted it well. Last year's growth was not much to brag about, but this year it made huge, strong shoots and such blossoms! But there is no fruit. Now, then, what is the matter and who has the plants that fruit? I have heard that there is an improved variety—if so what name has it? This California climate ought to do the trick and I think it will if the root is right.—J. A. S., Stockton.

We do not know just what is the matter with your elder. If you secured the plant from the Northeastern States they would send you of course one of their varieties, improved by selection in the way of bearing great masses of flowers for ornamental purposes. No one in our old time back there would grow elderberries for pies, for anyone could go out along the roadside or any old back lot and get buckets full of them. But we have understood that their selected, big-blooming plants also fruit freely—therefore we do not know what is the matter with yours. It is possible your plant will fruit when it gets over growing so rankly. Meantime you had better enjoy your posies and buy your elderberries in a can at the grocery. The botany of your plant is all right; the big-flowering kinds are varieties of the species *Canadensis*.

Red Spider's Ground Connections.

To the Editor: Red spider has done some harm to our prunes this year, but I cannot find any spiders in our prune trees. I have been informed they are in the ground now. If so, when will they come up into the tree again and at what time of year? Do they lay their eggs in the trees? If we should put a band of tangle-foot around the trunks of the trees would it keep them down if done soon enough?—D. J. R., Gilroy.

There is no such connection between the red spider, the ground and the tree as you have been told. There are often so many spiders on the ground that the clouds seem to be alive with them, but the tree is not dependent upon their ground connections for a supply of the pests. They lay their eggs on the tree until the bark becomes almost crusted with them, the eggs stay there all winter and the young spiders hatch out when it becomes warm enough in the spring. The eggs are so small that you can hardly see clearly the shape of them as round, ruby-colored bodies, without a magnifying glass, and the spiders are also

IS THIS YOUR PROBLEM?

Are you feeling the pinch of the continued high cost of living? Food and clothing still high, but earnings no greater, and not enough coming in to cover all expenses.

We can solve the problem for you. Take up our circulation work. It is a free, independent life in the out-of-doors, attending to our renewals and securing new subscriptions. You will like it, and will find just the opportunity you have been looking for.

Straight salary; permanent work. No investment necessary except that you must have an automobile. Write at once, telling us about your qualifications and experience. Full particulars will come back and you will be glad you investigated.

so small that it requires a magnifier to see them clearly. No matter how many you may keep on the ground by banding the trunk, the tree will have plenty from its own stock—therefore you cannot get ahead of the spider that way.

California Crop Rotations.

To the Editor: Please advise me as to the best book dealing with the subject of rotation of crops applicable to California conditions.—C. B. R., Santa Barbara.

There is no book which treats of the availability and desirability of specific rotations in California. Our possible crops are so many and our regional (and in fact small district) adaptations so many and diverse that to get anything closer than mere generalizations, each of them should have a book of its own adaptations and profitabilities. Until there shall arise a group of men wiser than any we now have, the best way for inquiring land-handlers to proceed is to inform themselves as fully as possible, by observation and by careful reading of our agricultural journals, books and station publications, about the characters and relations of crops and fit them as closely as possible to their own natural and commercial conditions and requirements. Every serious man should always study what he reads about the success or failure of crops from the point of view of its adaptability to his own growing and use or sale conditions and should try various things in a limited way to demonstrate the accuracy of his conceptions. In this way he may learn rotation for his own location and become wise—for it is really a very wise man who knows how to turn around right on his own ranch.

Overflowed Land Pasturage.

To the Editor: We have slough land on which the water stands too long to produce natural grass. What kind of grass do you suggest that would not drown out and the best time of the year to plant it? The ground is clear of water at this time of the year, but after it rains much it could not be planted. The water stands on it from an inch to four feet. It has been planted to beans the last seven years, but the water had to be pumped off in order to plant the beans in time. The renters have become tired of that since the beans dropped in price. If the grass would be good for pasture it would suit me the best; otherwise I would have to make hay of it.—J. E., Elk Grove.

The best plants we know of to grow on wet land and to stand overflow are rye grass and red clover. They have been grown in the Stockton district for many years. We were told once that red clover which went under on one of the islands, when the levee broke and the reclamation was abandoned, was the first plant to show green when the land was reclaimed again several years later! We do not pretend to say how it came back. Our informant believed it was a submarine and simply waited on the bottom. We believed that the seed might have done the waiting. But that does not matter. The plant did come back when the land showed up again. Rye grass will go under all right also, but we do not know how long it will wait. Rye grass will also hold on through any summer drying you are likely to get on wet land. Red clover will not go through so much drouth but will hold on pretty hard if the soil is retentive.

Shall We Plant Barley or Wheat?

Written for Pacific Rural Press by R. E. Hodges.

WHERE IT IS REASONABLE to expect either wheat or barley to mature a good crop, which shall we plant for the harvest of 1920? We will plant whichever seems to us likely to make the most money per acre. If our farms are wet and likely to rust wheat, we can't count on a good crop. If they are dry or subject to the summer northwinds, we may choose barley because it matures earlier than old-established varieties of wheat and consequently stands a better chance of maturing the crop.

If one kind of grain has been grown on the same land year after year, there is a much better chance next season for the other to make a good yield, because the soil may have become pretty well saturated with substances and diseases injurious to the old crop. But these and others are local questions largely having to do with the possibility of getting a good crop, which is assumed in our opening paragraph.

This paper is to discuss local and world markets, the demand and supply which pretty largely determine prices on such staple, easily-shipped, easily-graded products as grain.

The best figures extant on world crops are those compiled by the International Institute of Agriculture and accepted more or less completely by the U. S. Department of Agriculture. They are incomplete and not entirely reliable, but the best obtainable. For American crops, the Department of Agriculture's "guesstimates" are based on such numerous, representative and reliable reports that the commercial world depends chiefly on them and they are good enough for our purpose.

World Wheat Crops.

The 1918 figures on the world wheat crop are in most cases accepted as final estimates. Countries which harvested over 100,000,000 bushels are named below to show their relative importance when we mention the condition of their crops and their exportable surplus. Striking an approximate average between estimates, the total world crop in 1918 was about 3,885,000,000 bushels.

WORLD WHEAT PRODUCTION AND ACREAGE.

COUNTRY	1919 BUSHELS	1918 BUSHELS	1919 ACRES*	1918 ACRES
United States	940,000,000	917,100,000	71,526,000	59,110,000
Russia and Siberia* ..	721,106,000	721,106,000		
British India	278,021,000	379,829,000	23,403,000	35,497,000
France	233,781,000	11,779,000	10,850,000	
Argentina	184,268,000	219,431,000	16,976,000	17,875,000
Austria-Hungary	199,220,000			
Canada	189,075,000	16,958,000	17,354,000	
Italy	176,368,000	10,502,000	10,798,000	
Spain	138,396,000	135,709,000	10,228,000	
Australia	80,835,000	114,866,000	8,648,000	9,678,000

*1917 Estimates.

In the countries for which we have both 1918 and 1919 production figures the production this year will be 145,415,000 bushels less than in 1918. This is a decrease of 8.2 per cent. These countries produced over 45 per cent of the total world's crop in 1918. The countries for which we have both 1918 and 1919 acreage figures produced over 57 per cent of the world's crop in 1918. Their combined acreage in 1919 was reduced 1,570,000.

Condition of Wheat Crops.

Crop prospects in the United States dropped 221,000,000 bushels during July, 1919, bringing the estimated figures down nearly to those of 1918. Russian, Roumanian, and Austro-Hungarian prospects are hardly to be guessed at. The yield in India is expected to be over 100,000,000 bushels short of last year; in Argentina, it is expected to be 35,000,000 bushels less than last year; the acreage in Canada is smaller, but the latest report (May 31) indicated slightly better condition than last year, so the yield may be about the same. The French acreage was increased about 1,000,000, according to one set of figures, while another shows a decrease in total

WHEAT IS A BETTER BET THAN BARLEY FOR 1920 MARKETS.

The world will be at the line of wheat emptiness when the crop of 1920 is harvested. Our wheat will sell at prices made on the basis of short world supply and insistent demand. Foreign countries will not buy our barley except for brewing. If we raise as much barley in 1920 as we have this year, and if we ourselves consume the average amount of 13,000,000 bushels, we will have to sell outside of the State about 17,500,000 bushels. But the demand in California and America has already slumped and the demand from Europe will slump as soon as Europeans can grow their own barley. Hog feed is to be our principal barley market in 1920 if reasonable world conditions prevail—but hog feed will not take our surplus unless we reduce our acreage. Wheat planting this fall is a better bet than barley where wheat may reasonably be expected to make half as many sacks per acre.

acreage. Its condition May 1 (latest report) was 63 per cent. of normal as against 74 per cent a year ago, so the French crop will be shorter than last year. The Italian acreage decreased slightly and the condition was "average" at last report, so we may expect a decreased crop here. The Spanish crop at last estimates was expected to be over 3,000,000 bushels better than in 1918. Australian acreage decreased over a million and crop prospects indicate a decrease of about 34,000,000 bushels.

The 1918 crop itself for the whole world was about 36,000,000 bushels less than the average for the three years 1911, 1912, and 1913.

Exportable Surplus.

Each country aims first to feed itself and then export the surplus. More important than the amount produced is the amount available for shipment to countries which have not produced enough for themselves. Their demand and the price they will pay for the surplus, however small that is, will determine the price on the whole crop.

Russia, Siberia, Roumania, and India used to be large exporters of wheat, but they have none for export this year. India, instead of exporting 35,000,000 bushels as she did last year, will import 50,000,000 bushels, thus reducing the amount on the world's market 85,000,000 bushels less than last year in the case of that country alone.

Before the summer drouth reduced

World Will Be Wheat-Empty.

The world is going to be at the line of wheat emptiness by the time the 1920 harvest is ready for distribution and the world will eat wheat at whatever price it must pay. It would be cheap in comparison with many other staple foods if its price should double. There is every reason to expect the price to strengthen when supply and demand are permitted fuller play than at present.

World Barley Crops.

Barley crop figures are less complete, but are enough to give a fair indication of world conditions. The countries which produced over a million acres of barley in 1918 are in order of their acreage importance: United States, Spain, Germany, Canada, Japan, Algeria, Morocco, United Kingdom, France, and Tunis.

Figures for 1919 are available on the countries which produced considerably more than half of the world's tonnage in 1919. Their combined acreage this year has fallen off 8.2 per cent from their combined acreage in 1918. These countries do not include Germany or the United Kingdom, which may have increased enough to wipe out the 8.2 per cent and make the world acreage equal that of last year.

World Barley Markets.

Three uses of barley affect the commercial marketing of the crop. For human food, Americans have learned decisively that it cannot compete in any way with wheat except in price. Europeans like it but little if any better than we do.

For brewery purposes there will be practically no demand in the United States. Certain European countries may indulge in brewery products a little more on the 1919 crop than they did on the 1918 crop, but despite all that the brewery interests would say, beer drinking in Europe is on the decline if looked at in terms of years. Our recent barley inflation was caused by the opening of European countries to barley imports; but even with that, if exports from America are any criterion, Europe has imported far less barley of the 1918 crop than she did of the 1917 crop and she is likely to raise a larger percentage of her own requirements hereafter.

It seems true that Japan is increasing the use of barley for brewing, but it is also true that her 1919 acreage is greater than her 1918 acreage, and we have shipped practically none of our crop to Japan.

No Export Barley for Feed.

But our barley export business is a little peculiar in that the barley varies greatly in quality, and only a small proportion is of high enough

quality as a rule to ship.

The terms "shipping barley" and "brewing barley" are synonymous in California because the only barley we ordinarily ship is that which is most fit for brewing. But on the other side of the water this is separated into malting barley and feed barley, the latter grade often comprising more than half. This still further militates against any expectation of shipping barley to Europe for feed.

A great proportion of this year's crop has been bought up for shipment, but not a great proportion has been shipped yet and prices for future delivery are weakening daily. It seems inevitable that the barley market should get weaker month by month and year by year, occasionally taking a spurt as it has in the past few weeks, but forming no justification for permanent cropping to as great an acreage as in the past.

With barley, our California home consuming power has for years averaged around 13,000,000 bushels. The 1919 crop is 31,536,000 bushels as last reported. So we must export from the State about 17,500,000 bushels. Can we do it?

Barley Chiefly into Hogs.

For livestock feed, there is no doubt that barley is as good as corn in pork-making and finds corn its chief competitor in this field. The U. S. grows four times as much corn as the rest of the world combined. The U. S. corn crop promises to be two or three hundred million bushels greater than last year, and recent rains in the cornbelt have improved prospects since the estimate was given. This corn moves freely to Europe, in quantities many times greater than our barley exports, and is a determining factor in export prices. With so much more than usual of corn to export during the coming year, prices will not be likely to rise. Practically no barley is shipped to Europe primarily for feed.

For poultry feed great quantities of wheat are used and barley is fed to chickens only under protest when wheat is not available. We can scarcely hope to develop a market in this direction.

For horsefeed, all that anyone needs to say is that everybody admits a rapidly decreasing demand in this direction with no hope of revival.

For cattle feed there may be developed an increased demand in California and neighboring States for the California crop.

Hog feed seems the most promising market for barley and the man who would be hopeful to sell his 1920 barley may well look into the hog situation in the Western States as affected by local and Eastern conditions and base most of his hope on what he finds in this possible consuming agency.

Figure for Yourself.

Wherever there is reasonable assurance that either wheat or barley will make good crops, next year's biggest dollars will come from wheat. One interested party figures out the relative profits on the following basis, which may be altered to suit the probable yield on each man's own farm. This party believes that 1920 wheat will go around \$4 per cental, and barley will be not over \$2.25. Assuming that the barley will yield twice as many sacks per acre and that sacks will cost 20 cents:

RELATIVE PROFITS PER ACRE FROM BARLEY OR WHEAT IN 1920.

Reasonable Income Per Acre.	Cost of Harvest.	Net Profit Per Acre.
Wheat: 10 sacks at 130 lbs. total 1300 lbs. at \$4, bringing\$52	Ten bags at 20c.....\$2 Threshing\$3 Total\$5	Wheat. \$52 — \$5 equals \$47 net per acre
Barley: 20 sacks at 100 lbs., total 2,000 lbs. at \$2.25, bringing\$45	Twenty bags at 20c ..\$4 Threshing\$3 Total\$7	Barley \$45 — \$7 equals \$38 net per acre

Concluding a run of 20 days, the longest run on Tuscan cling peaches in the history of the California Packing Corporation, the plant at Yuba City has finished 67,000 cases of the fruit.

Control of Anthracnose on Loganberries.

Written by Prof. H. I. Schnabel, Agricultural Director, Union High School, Sebastopol.

Spraying for the control of anthracnose on loganberries was begun in August of 1917, on the farm of H. A. Chinnook. After the old canes had been removed a 4-4-50 Bordeaux spray was applied. A second spray was applied March 4th, and a third on April 25th. The same strength spray was used in each case. The results obtained were as follows:

Check row—no spray applied—contained only.....	14% good vines.
Row which received 1 spray (Fall) contained	28% good vines
Row which received 2 sprays (Fall and Spring)	35% good vines

The above results do not show very good control. However, the yield on the sprayed parts was 3 or 4 times as good as on the unsprayed part.

Results on the F. P. Doyle Ranch.

This field of logans was almost dead in the Fall of 1918. It contains about 5 acres. Many ranchers told Mr. Morgan, the tenant, that it would not pay him to put up the canes. However, he was very anxious to get something out of them, if possible. He inquired about a spray and wanted to know if it would help the crop the first year. This was expecting a great deal from such a poor field, but we thought best to give it a trial. The first spray was applied, to about one-half of the field,

just before growth started in the spring of 1919. A second spray was applied when the new shoots were about 6 inches high. Lime-sulfur was used for both sprays. Two and one-half gallons to 50 gallons of water were used for the first spray, and 1½ gallons to 50 for the second. Two rows received no spray at all, 54 rows one spray, and 43 rows two sprays. The total cost for spray material was about \$5 per acre, and was considered a prudent expenditure.

Results of Spraying Logans.

(a) Average no spray row produced	60 lbs. of berries
Average one spray row produced	123 lbs. of berries
Average two spray row produced	155 lbs. of berries

The total production was 13,400 pounds. This is a low yield, but it must be remembered that this season (1919) has been a very poor one. The

total amount of berries shipped this year by the Berry Growers, Inc., was at least 50 per cent short of last year. Considering the poor season and the

very poor condition of the vines when the first spray was applied, the yield was much more than the owner expected.

Average check row (no spray)	40% diseased.
Average one spray row	18% diseased
Average two spray rows	15% diseased
Average three spray rows	11% diseased

The presence of diseased new canes was noted on July 29, 1919.

Control of Disease on the New Canes.

From these figures it appears that one spray is almost as good as two. However, the comparison is not exactly fair, because the vines were more diseased at the start where the two sprays were applied than where only one was applied. If it had not been for this fact there might have been better control where two and three sprays were applied. When the sprayed rows are compared with the check row it is very evident that the spray checked the disease. Another year of spraying should bring the disease under control and the vines in good condition.

Conclusions.

The experiment certainly convinced the owner and tenant that it pays to spray. In fact Mr. Morgan believed in it so much that he came very near not leaving any check rows. The adverse weather conditions make it impossible to make any positive statements, but it does appear that Lime-Sulfur will not only control the disease but increase the yield as well. On very bad fields two sprays are recommended.

- 1st. Prune out the old canes early in the Fall and burn.
- 2nd. Spray with Lime-Sulfur, 2½ gal. to 50 of water in the Spring before growth starts.
- 3rd. Spray again, using 1½ gal. to 50, when new shoots are 6 inches high.

In the left-hand picture, the vines to the left of the lady have been sprayed and the ones to the right are unsprayed. The right-hand picture is self-explanatory—the vines to the left having been sprayed and those to the right unsprayed.

and the ones on the right are unsprayed. The right-hand picture is self-explanatory—the vines to the left having been sprayed and those to the right unsprayed.

A Block of Black San Pedro Figs

The market for fresh figs is yet limited and easily supplied. Winters and Newcastle have a good trade and with good luck in weather these fresh figs generally pay well as they do from the South. The Black Mission shipped so largely from Northern California is the oldest fig in the State and because it does so well under such varying conditions of soil and climate, is so prolific and grows to such magnificent and symmetrical proportions it is a universal favorite. But fresh figs have to be handled and packed as if they were eggs, only in smaller containers, and are therefore likely to remain in the luxury class, while the dried figs and the canned or processed figs are likely to become staples.

A friend recently told us of a block of Black San Pedros, and we went to the Honora Realty Company's orchards at Lemon Cove, Tulare county, to see them. The manager, C. E. Goodale, was away, but we had a talk with the foreman about the Black San Pedro figs on the place. It is only a small side line here, for this company has 200 acres of Valencia oranges—from newly planted trees to those six years old; also 300 acres of Washington Navels and 100 acres of Lisbon lemons. In reply to our questions the foreman told us of their manner of handling the Black San Pedro, which

is believed to be the largest fig grown—white, black, or brown, and a very fine fruit for fresh table use. The company picks and ships all of these figs green, the first crop being ready about June 15. After this has been cleared there is an interval of two or three weeks, after which there is more or less continuous picking right up to frost. The figs which drop to the ground are gathered up twice a week and dried. Last year from this small lot of trees 4,000 eight-pound crates were shipped in addition to which four tons of dried figs were sold. The fresh figs were said to have brought from \$1.25 to \$1.50 per crate on the Eastern market.

We asked the foreman how they dried as compared with the Black Mission. He said they dried well and were of good flavor—no souring in that locality. The only drawback to the fruit as a shipper was that owing to its exceedingly short stem, this was likely to break off from the fruit unless great care were exercised in picking and then the fruit might shrivel a little in the crate. Though this does not injure the flavor of the fruit it takes away from its attractive appearance. This fig is a purplish black with a green neck and a smooth skin. We spoke afterwards to a packer about these figs and he said, "Yes, it is a very good fig, but was somehow never propagated on a large

scale because we had the Mission, which is a good old standby and has been in vogue ever since it was brought here by the Mission Fathers and is hard to beat. I did not know there were as many as 11 acres of Black San Pedros in the State."

This whole place, which is irrigated once a month, is kept in the best state of cultivation with four Samson tractors and six teams—for over 600 acres of fruit.

From the statement of facts about the Black San Pedro it will be evident that this young orchard creates no record. Plenty of Missions have done as well and perhaps better. It is a simple statement of what we gathered of this interesting variety.

Concerning the Importance of Sulphur

(Written for Pacific Rural Press.)

Sulphur is one of the seven mineral elements in the soil which are believed to be absolutely indispensable to plant growth. As pointed out in a previous article, the teachings of the past fifty years, due largely to Liebig and his followers, have emphasized the importance only of nitrogen, phosphorus, and potassium on the assumption that those are the only three of the seven elements mentioned which were ever deficient in ordinary soils. These teachings have formed the basis of the fertilizer practice which has been in use for fifty years or more and which is still in use, perhaps more widely and intensively than ever.

How Sulphur Was Overlooked.

The development of scientific investigation and the critical attitude among some soil investigators in the last ten years has called in question many of the old assumptions and among them the idea that the addition of chemicals to soils for their improvement shall be limited to those containing any one or more of the well known three elements—nitrogen, phosphorus and potassium. The result has been that among the other essential elements sulphur received considerable attention at the hands of investigators. Hart and others at the Wisconsin Agricultural Experiment Station have shown in the first place that the analytical method for sulphur in plants, prior to their work, had been such as to volatilize much sulphur and, therefore, to give very low figures for the sulphur content of plants. In the second place, those investigators have shown that an addition of sulphur or sulphur containing materials to soils may be productive of considerable increases in plant growth on those soils. This has been confirmed by experiments at the Kentucky, Oregon, and other agricultural experiment stations. The increases in crop yields noted are not necessarily to be accounted for, as all of these investigators have assumed, by the hypothesis that sufficient sulphur as an indispensable element for plant growth was lacking in available form in the soils in question. Such increases in plant growth may have been induced by certain chemical reactions in the soil solution which result not necessarily in making more sulphur available to the plants but of making larger quantities of other essential elements available in a properly balanced form with the other elements.

How Can Sulphur be Applied.

Assuming, however, that sulphur applications to many soils may result in considerable crop increases, regardless of the mechanism or theory involved, the practical question is how it may be best applied to soils. Many of the materials now used as fertilizers contain sulphur which has not been commercially valued to date. For example, sulphate of ammonia, sulphate of potash, the gypsum present in acid phosphate, and the magnesium sulphate present in some of the german potash salts. For supplying sulphur to soils, however, we have other relatively cheap materials which make unnecessary the use of the substances just named. Thus, we may employ flowers of sulphur, gypsum as such, sodium sulphate, possibly sulphuric acid, and possibly also sulphide ores. On soils on which we are convinced that sulphur gives undoubted increases in crop growth, fifty pounds of sulphur

per acre may be used. Its practical equivalents in the other forms named would require about three hundred fifty pounds per acre of gypsum, and one hundred fifty pounds per acre of sodium sulphate. The other two materials need not ordinarily be considered since sulphuric acid is difficult to handle, and sulphide ores are usually difficult to obtain. Aside from these considerations, the cost of material should always be the final determinant of the choice of the material and the amount to apply.

How Sulphur Acts in the Soil.

It may assist perhaps to understand the fate of sulphur when applied as such to soil. There are bacteria in the soil of a specific group which oxidize sulphur to sulphuric acid. The latter reacts with the minerals of the soil and renders them more soluble and in that reaction forms sulphates with the bases of the minerals attacked. These sulphates furnish such sulphur as the plant needs for its uses but are also active in maintaining further reactions. Such reactions would, of course, be induced directly by the gypsum sodium sulphate or any other metallic sulphate application like ferrous sulphate or copper sulphate and partake of the following nature. They are practically the same as the reactions induced by sulphate of potash which I have endeavored to explain in a previous communication. Thus, the metallic sulphate in solution dissociates into the metal and the acid combines with the dissociated water. This results in the production of more active solvents than the ordinary soil water, and hence, the resulting increased concentration of the soil solution and the addition thereto of increased amounts of specific acids and bases theretofore not present. This indicates clearly that the addition of either sulphur or a sulphate to a soil may accomplish many reactions in the interests of plants and among its many missions, the supply of available sulphur to plants is only one.

All of these considerations make it appear that we shall be obliged to accord to sulphur a much more important place than it has heretofore received in the theory and practice of soil chemistry, and a place which, in my opinion, should be that of a distinct and unequivocal parity with phosphorus, with potassium and with calcium.

Owing to the cool ripening season it is possible that prunes may not weigh up to grade. Growers generally are keeping the first pick separate until they are thoroughly dried. A good many people throw the muddy colored ones out entirely—a good plan, for they are poor stuff even when dried out.

WILL SOME ONE PLEASE DEFINE PROFITEERING?

(Written for Pacific Rural Press.)

The following is taken from the letter of a small prune grower. It came to the office August 23: "I don't quite like the outlook for our fruit associations. I see in today's paper that a California Fruit Growers' Exchange man in Ohio has been arrested for profiteering and that Attorney-General Palmer has made representations to Congress that penalties should be imposed for profiteering on producers' organizations conducted for a profit. Are we supposed to conduct them for our health? Labor fixes the price of what it has to sell to us; are we to suffer them to fix the price of what we have to sell, too, though our greatest overhead cost is labor in some form? We do not hoard—our produce is marketed and we have to spend most of the money directly the crop is harvested. If consumers are held up by hoarded and dribbled-out supplies, the producer is not to blame. Is not the profiteer the man who exploits our products for unwarrantable profits? We have many lean years and dead losses to make up and when a year arrives that this becomes possible, the farmer is jumped on even though the price is based on supply and demand. Does Attorney-General Palmer want to hand our producers' selling-organizations back to the tender mercy of the few professional packers again? If so, why?"

HORTICULTURAL JOTTINGS

Fruit growers of Sutter county are paying grape pickers \$3.25 a ton, and 12½ cents a box for picking prunes.

Shipping of Tokay grapes has commenced in the San Joaquin district. The fruit seems to be ripening nicely.

Some sales have been made to the trade of this year's crop of almonds at 35 cents a pound for Nonpareils, it is reported.

Elmer Betteton and Oscar Lane of College City (Colusa County) sold their Muscatel grapes for \$225 a ton, the highest price ever received here.

A Japanese strawberry grower in the Santa Clara Valley is said to have sold \$45,000 worth of fruit from 15 acres—an average of \$3000 an acre, or 200 chests at the present price of \$15 a chest.

Around Clovis a very heavy crop of peaches is being cut and dried, and fig picking is starting. The Indians are coming in from the hills to pick the raisins and to date there has been no shortage of labor.

Geo. McWilliams, a local representative in Cleveland, Ohio., of the California Fruit Growers' Exchange, was charged last week with violation of Ohio's Anti-Trust law by the grand jury investigating food price profiteering.

George Hudson, acting for the Department of Justice, has obtained evidence of alleged profiteering on raisins by a Fresno jobber. The California Associated Raisin Co. was relieved of all responsibility for high prices in a report made to the Dept. of Justice.

It is estimated that about 1500 carload of table grapes will be shipped from the district between Etiwanda and Ontario (Riverside Co.) this season. The grapes will not be ready much before Sept. 10. Last year picking started Aug. 27.

Seventeen thousand dollars was paid for labor on the Apricot crop and the amount paid for labor on peaches will be several times greater according to Paul C. McAbee of the Porterville Canning Company speaking of this company's activities.

Catalogue of Harness, Saddlery, Trunks and Traveling Bags sent free on request.

One ton of dried peaches to the acre is expected by Mrs. F. W. Weeks and Son on their 50 acres of Elbertas, Muirs and Lovels at Red Bluff and Los Molinos (Tehama County). Next year they intend to have a tractor to keep their orchard in good cultivation.

In the Colfax pear region this year the crop is very light. Last year was a dry year in this mountain district and a 70 per cent crop resulted. This year the crop is only from 50 per cent to 60 per cent on most ranches but the size is good. They run from 135 to 150 the box.

Eighteen to twenty tons of peaches to the acre are not unusual in Sutter county this season. E. T. Barrett showed three mid-summer peaches in Yuba City weighing three pounds, five ounces. He expects over 18 tons to the acre. Many growers are realizing \$1,000 to \$1,500 an acre.

The fastest peach cutter of the State is employed in Sacramento canneries. Miss Etta Corey is averaging \$15 a day with Tuscan clings and expects to average with Phillip clings which are larger from \$20 to \$22 a day. Her record for this season is 82 boxes in nine hours, which at 20 cents a box, netted \$16.40.

Owing to the depreciation in English currency and the fixed maximum prices that are set for apples imported into the United Kingdom some slight check of business has resulted. The par value of a 38-pound box of apples at the set price being \$4.80, the exchange value is only \$4.31—the pound sterling having depreciated that much.

"A light truck, either new or converted from an old outomobile is the best thing yet," said a grower from the Auburn district—J. A. Teagarden. "There is no bruising of the fruit in transit, no ripping of trees or running away on the part of horses, and you can make half a dozen trips where you only do one with a team. We are all getting them now."

The Woman's Land Service has opened an office at 333 Kearny street, San Francisco for recruiting women for grape-picking in the Lodi section. The wage scale is 35 cents an hour and overtime. A nine-hour day at \$3.25 is guaranteed. The camp has been laid out by the Immigration and Housing Commission. The crop is large and picking will continue for two months.

A gross return of \$1,150 per acre, or \$7,000 on six acres of Bartlett pears and apricots is the return that A. B. Harden on Stanislaus river bottom land near Oakdale received this season. From one hundred and sixty 20 year-old-Bartlett pear trees 38 tons of green fruit sold for \$3000. A second picking was sold green. The apricots from less than four acres sold to the canner green for \$3,004.

According to J. L. Nagle, manager of the California Fruit Exchange there will be a big demand for wine grapes for shipment next month, provided the government rescinds war time prohibition. He states that he can secure orders for 1000 car loads to be shipped at prices ranging from \$50 to \$55 per ton lugs extra. In case wine can not be made, many of the grapes will be dried, for which a price of 10 cents per pound will be paid.

The Banks Evaporator (W. A. Banks, San Jose) reports among a number of recent sales that the following places have been furnished plants for fruit drying. Orchardists and orchard companies, at Hollister, Campbell, Cupertino, Woodbridge, Cucamonga, Mt. Diablo, Canada, Honolulu and the Australian government. At the present price of trays it is claimed that the expense of sun-drying 250 tons of prunes would about equal the cost of installing an Evaporator.

The Elk Grove Vineyard Association Growers have signed three-year contracts for the sale of their crops to the Virginia Fruit Products Co. of Oakland. The price paid for this year's crops of wine grapes is \$30 a ton, the two succeeding years at market price. The grapes are to be crushed at the Elk Grove Winery and

will be made into a non-alcoholic beverage. The crop will amount to about 3,000 tons from 1,000 acres of black grape vines.

A Wise Investment

EVERY time Biddy cackles you are three cents ahead. Invest that three cents in kerosene with which to operate a 1½-H. P. International kerosene engine and you have the power of twelve men under your direction for an hour—all for the price of an egg. To get useful power at a reasonable cost buy an

International Kerosene Engine

This sturdy, dependable engine will pay for itself over again during a year. Let it pump water, saw wood, run the sheller, washing machine, feed cutter, in fact do all the odd chores about the farm. Its shoulders are stronger and broader than yours and it does not get tired.

All three sizes of International kerosene engines, 1½, 3 and 6-H. P., operate successfully and economically on kerosene (coal oil) or gasoline. This means that the engine is properly designed, that the mixer, ignition system, oiling system, air and gas system are all made right.

See an International dealer. There is one located near you, or write the address below and get full information.

Here and There in the Fruit Business

An Elderly Vineyard.

A little vineyard near Clements (San Joaquin County) that was planted by Edward Putnam in 1859 from imported grape cuttings is still alive and is yielding profitable crops of grapes. It was submerged in the flood of 1862-63 but came up uninjured after several weeks of immersion. After 60 years of usefulness a fair crop is to be garnered from the veteran vineyard this year.

Uncle Sam in the Show Game.

The U. S. Department of Agriculture has gone into the show game. It has recently issued films showing all the phases of the fruit-growing industry in California. These 'movies' will prove of great educational value all over the world as they set forth all operations of growing, harvesting processing and packing the fruits. Peaches, apricots, prunes and cherries are the chief fruits shown. The peach growers have sent out very complete movies of their own, while the raisin and citrus industries have also had wide publicity.

Mount Vernon Packing "Bee."

The Mt. Vernon Community Packing house at Auburn closed last week after a record breaking run. The solution of their labor problem was solved by their own Women's Club assuming the duties. All the members (150) were thus able to get their fruit packed by practised hands at a minimum of cost as J. A. Teagarden superintended the management and growers were released to devote their entire attention to harvesting. As time goes on it is expected that the system will be enlarged and perfected.

Treating Crown Gall Successfully.

F. B. Smith of Saratoga, some of whose apricot trees were badly affected with Crown Gall, dug down and chopped off the affected portions clean, even chopping off some of the roots. The wounds were well bluestoned and the trees have recovered and healed over the wounds very nicely. Mr. Smith is well pleased with the work for his trees look healthy and bore large crops of fruit this year.

Pruning Course at Davis.

A two weeks horticultural short course will be given at the University Farm, Davis from Dec. 8 to 20. The principles and practice of pruning both young and bearing trees and advantages of some pruning in early summer will be expounded that fruit growers may become familiar with the new method employed. A number of growers will take advantage of this special course.

Going After Business.

By co-operation we are able to find new markets for our produce and our people are doing this. But we are not the only ones. See what British traders are doing: "The newly organized Federation of British Industries including in its membership about 17,000 manufacturers and other producers of Great Britain, is behind the scheme to send British trade commissioners to every part of the world and to establish a most far-reaching and effective service of information. It is designed to have this organization render service both to the members of the Federation in Great Britain and to their customers in the various fields throughout the world."

Heavy Bearing Raisins.

The 1919 crop of Thompson seedless grapes on the Bassett property at Terra Bella will amount to four or five tons to the acre according to an estimate in the Terra Bella News.

The vines were planted four years ago and the following year Mr. Bassett sold his crop of one ton to the acre at \$140 a ton. A portion of the crop this year has been sold at 9c. a pound fresh. Some crop!

July Crop Estimate.

The Fruit crop estimate based upon conditions July 1st, and made by J. E. Richards of the Bureau of Crop Estimates of the United States Department of Agriculture is condensed as

follows: "All crops combined show a condition of 102 per cent, counting a ten year average as 100." Following are conditions of various crops as reported July 1 on such average.

Prunes	131.6
Apricots	127.5
Peaches	126.5
Walnuts	126.5
Pears	115.4
Apples	112.7
Grapes	109.8
Lemons	107.2
Hops	105.5
Watermelons	104.5
Olives	78.8
Oranges	92.8
Blackberries	97.8
Blackberries	100.0
Cantaloupes	101.1

Breach of Peach Contract.

Suit has been filed at Modesto by the Pratt-Lowe Preserving Co. against Dr. C. W. Evans asking \$534,000 damages, charging that defendant has repudiated his contract to sell all peaches grown on his land near Modesto for the season 1919-1920 at prices up to \$25 a ton. Dr. Evans recently sold these peach orchards on which there is said to be a 1000 ton crop.

Quick Turn On Apples.

J. P. McDonnell of Sebastopol bought a 21 acre apple orchard near Graton this summer. Eleven acres of which are Gravensteins and the rest late stuff. The purchase price of the orchard was said to be \$22,000 and the Gravenstein crop has brought him \$12,000 with the late apples yet to sell; another instance of where seller and buyer both make money.

Cantaloupes in Imperial Valley.

Horticultural Commissioner Waite says of Imperial Valley:

"This season there were 14,088 acres of cantaloupes, and up to July 18, 7800 carloads had been shipped. Last year there were 10,942 acres and 4405 cars were shipped. The largest number of cars shipped previous to this year was in 1917 when 5080 were shipped. "With the acreage and shipments as stated for this year, making an average of about 175 crates to the acre, there seems to be little cause for alarm. Estimates for a next year's crop runs as high as 25,000 acres. If the acreage is anything like the estimate, it might be a benefit to have root knot or some other pest to reduce the shipments."

Two Strings to One's Bow.

"It is a fine thing to have two different ways a man can handle a crop. An Exeter man arranged to ship his Elbertas green and the shipper impressed upon him the necessity of picking them green enough. He followed instructions and they culled out a whole lot of his fruit because it was too green, so he just naturally quit picking; let his fruit ripen and dried it.

Manufacturing Syrup on Shares.

Levi Lunquist of Lake County has a small plant at Middletown for reducing grape juice to syrup. A ton of grapes produces about 32 gallons of syrup for black grapes and 40 gallons from the Golden Chasselas. In crushing grapes for neighbors, he makes the syrup for half the product giving the grape grower 16 to 20 gallons per ton of grapes. He does not go into details but says he has applied for patents for his process.

A Goodly Stand of Trees.

Geo. W. Brown near Dairyville, (Tehama County) has 12 acres of young prunes in their fourth year of growth that run 16 feet high. A fifth year almond tree measures a foot through at the butt. A deep sediment soil, plenty of water and good cultivation does the trick.

Don't Waste Peach Culls.

Although clings are strictly a canning peach it should be remembered in a year of high prices like this that culls are worth far more dried than wasted. Not only can small fruit be saved, but large, ripe fruit that falls to the ground and becomes unfit for canning can be dried nicely.

Fairbanks-Morse
"Z" Engine with
Bosch Magneto

Greater Engine Value

OVER 250,000 farmers bought the "Z" engine. They know it is powerful, dependable, and practically fool-proof—truly a great engine. But now we announce the one addition which could possibly improve the "Z" performance—Bosch high tension, oscillating magneto ignition. So let the "Z" dealer near you show you in detail this greater engine value. Over 200 Bosch Service Stations combine with "Z" dealers to give every farmer buyer a remarkably complete engine service. Prices—1½ H. P. \$75.00—3 H. P. \$125.00—6 H. P. \$200.00—All F.O.B. Factory.

Varying Results in Blasting in Orchard

(Written for Pacific Rural Press.)

We recently called on Harry L. Bell of Napa to see a young orchard of No. 1 prunes he set out three years ago. We had occasion to inspect these trees when they were bought. There are several No. 1 prunes on the market and they are all good. One of them has all the characteristics of the Imperial and the curing quality of the French. Mr. Bell, who has forty acres of prunes—young and old—is a strong believer in the importance of bud-selection, as are most men who have given the matter thought. We found he had a very even stand throughout except a few adjacent to some large oaks, and the young trees are in shape to start producing in a small way next year. This by the way.

What Do You Know About Blasting?

"Come over here and I'll show you some trees I blasted for," said Mr. Bell. "Now, you see that bare space with 'misses' and replants in it. I blasted into the clay there and that is what I got by it. I know if you blast in wet clay you simply make a pot hole. But I blasted that dry and I have a pot hole anyway at each tree." We then told Mr. Bell some of our own observations on blasting. Where clay is within two feet of the surface and the clay is dense and impenetrable, not only is it useless to blast but it is no place for trees. For over that kind of dry clay no tree will ever make a very large size. A good quality of moist clay at that depth is often kindly to apples and pears if the water table is not too high and surface drainage is decent. Stone fruits except some plums don't want it. Two miles to the north of Mr. Bell's we know of a hard-pan land where blasting has excellent results. The hard-pan is from a few inches to perhaps 18 inches thick with a sandy soil beneath. Blasting makes this mediocre grain land into very fair tree land. In the Sacramento and San Joaquin valleys where the cemented hard-pan and clay make a bottom impervious to water, blasting "makes" the ground. The holes should however be cleared out of clay and hard chunks and be refilled with surface soil after the operator has assured himself that the hard-pan has been penetrated. If it has not, another shot must be put in or only a pot-hole like Mr. Bell's has been formed.

Adobe Shooting.

Adobe land should be blasted while it is dry and not planted thereafter till the holes have been well settled

by the winter rains and capillarity restored to some degree. Even at that it pays to tank trees planted on adobe soil the first season as this granular soil easily lets air to the roots of young trees while they are young and near the surface. Two tankings is generally enough if they are well hoed afterwards as soon as ever the ground is fit. Where the adobe is underlaid with a chalky clay marl, a shot from the surface can be put in and it does splendid work if properly carried out. In sections where the adobe is underlaid with clay, the shooting must be done when it is dry and the clay thoroughly cleaned out if trees are to be planted. It is better to do this if drainage for surface crops only is sought. We know of good wheat land in Sonoma County where there is a stratum of clay at a depth of about two feet which is not too thick to handle with a blast. This land never carried even a good grain crop of a very wet year—the soil remains too wet and cold, for the layer beneath is genuine 'gumbo.'

Hard Pan Land.

There are plenty of orchards planted out on good hard pan land that could be perhaps doubled in their productive value by blasting some good drainage holes out in the middles of the rows. But the practicability of the work would have to be investigated first to be sure that its value will be unquestioned. One reason why some men are disappointed and their young trees dry out on some soils is that the ground has not settled back again sufficiently after the blasting to convey moisture. Then without an irrigation their trees may dry out more or less until perhaps the following season. Hard pan land cannot be condemned off hand because of the hard pan. The majority of our valley land has substratum of hard pan in many fruitful sections. Some of the most profitable figland is hard pan land according to the late Henry Markarian. But judgment is needed in handling it, and that would be difficult without explosives.

CARRYING AND RIPENING FRUIT IN STORAGE.

(Written for Pacific Rural Press.)

In the experimental cold storage plant at the University plant, many interesting discoveries were made in the holding and ripening of fruit. Last year pears were late after a hot dry summer. They were put in storage when picked at the usual stage and were found to ripen best at a temperature of 70 degrees to 80 degrees. At a temperature above that, the ripening was retarded so that at 100 degrees say, it would take six weeks for them to ripen. It is also known that apple tissue turns brownish under cold storage as now practised. This can be overcome by storing apples at 38 degrees instead of 32 degrees. The fruit also sweetens better—the starch is turned into sugar and this improves the keeping qualities.

Fruit that is ripe keeps longer, carries better and is more palatable and nutritious than is unripe fruit in storage kept at a degree which prevents chemical changes and which comes out of storage at the same degree of unripeness at which it went in.

Cherries evaporate water through their leaves stems and wood. It cannot be evaporated through the skin of the fruit which is sealed but it can through the stem.

Thus, if cherries are picked unripe, the stem will remain green because it draws sap from the fruit. And the stem will remain green till the fruit is shrivelled. But if the cherry is dead ripe the starch is turned to sugar and then the fruit draws the sap from the stem and remains plump after the stem has become brown and dry. Dr. Whitten also told us that in shipping grapes, any mould found on the stems on opening

The **FARMER** says—
"for stumping
genuine **GIANT**
has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

the package may denote that the fruit was unripe when picked. Dead-ripe grapes would absorb the sap in the stem, which would gradually become withered and dry, leaving the grapes plump and full.

ASSOCIATED RAISIN COMPANY SETS PRICES.

Opening prices on this year's crop have been announced by the California Associated Raisin Growers, Inc., as follows: Sun Maid (seeded, fancy), 15 cents a pound; Fancy seeded, 15 cents; 12-ounce seeded, 11½ cents; Choice seeded, 14½ cents; Bakers' seeded, 13½ cents; Fancy bulk seeded, 14½ cents; 1-crown loose Muscatel, 13½ cents; 2-crown loose Muscatel, 13½ cents; 3-crown loose Muscatel, 14½ cents; 4-crown loose Muscatel, 14½ cents; Thompson seedless in 25-pound boxes, 14½ cents, and Sultanas in 25-pound boxes, 14½ cents.

Layers.—3-crown trade pack, per 20-pound box, \$3.10; 4-crown trade pack, 20-pound box, \$3.20; 6-crown trade pack, per 20-pound box, \$4.05.

The higher prices this year will help to reimburse some of the losses of raisin growers in the past, including last year, when untimely rains resulted in heavy destruction. A large portion of the crop has already been sold. According to Wylie M. Giffen, President of the Association, the price to the grower, reduced to a sweat-box basis, will amount to about ten cents for Muscats, eleven cents for Sultanas, and 11½ cents for Thompsons, if all the crop goes to consumption. These prices have been fixed in accordance with relative value of other products in so far as estimation of the purchasing value of the dollar in these fluctuating and inflated currency can be computed.

"The price of raisins must necessarily be determined both by the law of supply and demand and by the general level of other commodities of life at the time the price is made."

Harvesting and Processing Walnuts

(Written for Pacific Rural Press.)

To the Editor: Will you please send me the latest bulletin on walnut curing, etc., or kindly give directions in the Rural Press for same. I am an old subscriber and have a large crop. Also best way to prop the trees.—V. H., Blocksburg.

Ninety per cent of the growers in Southern California belong to the California Walnut Growers' Association. The hulled nuts are sent into their local packing house or to Los Angeles and washed, graded, bleached and dried and marketed as described in our issue of March 15. The machinery for processing walnuts in a large way is rather expensive. The washing is done in large revolving cylinders of wire netting or perforated iron which slowly revolve and the nuts scrub themselves clean in jets of water or in water.

You may have to make something of the kind or else a "shaker" which, however, would have to be used carefully so as not to break the shells. In bleaching the nuts the sulphuring process has been abandoned as spoiling the flavor of the nut.

You can make a dipping box with heavy mesh bottom. To make your dipping solution the following formula was given out by the University of California Experiment Station: "Six pounds of chloride of lime, twelve pounds of sal soda and 50 gallons of water. Dissolve the bleaching powder in four gallons of water and the sal soda separately in four gallons more. Add the two solutions together and stir well. Let the carbonate of lime settle to the bottom and draw off the clear liquid adding enough water to make up 50 gallons. Put the nuts

in the dipping box or crate and immerse in the fluid and then add 1½ pounds of 50% sulphuric acid and agitate by raising and lowering the dipping box. The bleach is reached in five to ten seconds and the nuts are then washed in water and put out to dry. The same liquor can be used with new batches of nuts so long as the proper effect is produced and small additions of acid will prolong the efficiency of the liquor." This process was first protected from commercial use by patent. Graders with spraying (bleach) devices attached are put out by manufacturers of prune graders. In grading the nuts, No. Ones are those which will not pass through a one-inch square mesh screen. They should also be hand-picked on the trays to eliminate anything that spoils the sample. In your climate, artificial drying may be necessary for a large quantity or they should be spread thin on the slatted trays and stocked at night to prevent their becoming mouldy or discolored by damp or wet weather. In drying, they may be occasionally stirred on the trays so as to dry them out as rapidly as possible. Where they have too long an exposure to the sun they may split open a little. You may dry them by storing (after the wetness has been evaporated) in slatted bins, well off the ground in a dry shed or barn and with plenty of ventilation. If these bins are made V-shaped you can draw off your nuts from a chute at the bottom and settling of dampness is avoided.

Chas. J. Kuhn, walnut grower of San Jose, referring to walnut bleach says: "We are using the Anderson-Barngrover formula (the one referred to above) excepting that instead of immersing the nuts in the solution, we spray it on to them while they are passing through an enclosed prune shaker. The process is not simpler but the results are much better as we get no walnuts soaked full of the solution."

With regard to your last question, propping of walnut trees is rarely necessary. If they are young and pulling apart too much by weight of foliage, lighten them up a little by pruning back to leaders or else wire them in to staples from inside the tree as suggested with prune trees.

LABOR RATES AND THE FRUIT HARVEST.

The game is on! We are right into the fruit harvest—pears, late peaches and table grapes are flooding the packing sheds, factories and railroads with fruit. Seedless raisins are coming right along and the prune picking has commenced in earnest. The high prices obtained for fruit have enabled growers to be generous in regard to wages. Day wages by the hour range from 45 to 50 cents per hour. Forty-five cents is being paid in the prune orchards for all work and from \$6 to \$9 a ton, according to the quality and quantity of the fruit and orchard conditions. Apple and pear pickers are getting the same, or \$3.50 and found. Grape pickers are getting

Saves a Team on the Binder

Cushman Binder Engine

The Cushman 4 H. P. is the one Successful Binder Engine. Thousands are in use every harvest. Fits any binder. Engine drives sickle and all machinery. Since horses have only to pull machine, two horses will easily handle 8-ft. binder in heavy grain. In a wet harvest Cushman Engine saves the crop, as it keeps sickle going when bull wheel slips.

Very important—The weight of the engine on the rear of the binder, only 167 lbs., is balanced by the simple cone water cooler on the front of the binder. This balancing, and the water cooling, to prevent overheating on all day runs, are necessary to successful work in a hot field.

After harvest Cushman engine does all other work. Very light weight and easy to move around, yet runs more steadily than most heavy engines, because of Throttle Governor and perfect balance. 4 H. P. weighs only 190 lbs.; when stripped for binder only 167 lbs. 8 H. P. only 320 lbs. Also 15 and 20 H. P. sizes.

SAME ENGINE FITS

Corn Binders, Mowers, Reapers, Manure Spreaders, Potato Diggers, etc.

LIMA BEAN CROP SHORTER THAN WE SAID.

To the Editor: In an article in the July 12 issue of Pacific Rural Press it is stated that the Lima Bean crop is 59 per cent of the normal crop, the reasons for the shortage being lack of moisture at planting time and a fungus disease causing more or less wilt. About the crop average, I am sure your informant was wrong. I will volunteer to cut that estimate right in two and I am willing to back my judgment in a substantial manner. The best fields under irrigation are not going to produce more than your estimate of July 12; and the unirrigated acreage which largely predominates will not produce over a 20 per cent crop.—C. L. Chrisman, Ventura.

[Thank you, Mr. Chrisman. If growers would more generally criticize the material in this paper, as you have done, it would be a still better paper. What our readers write is frequently better material than what our writers write, and we are always glad to hear from our readers on any farm subjects. We will not print names, if requested not to do so.—Ed.]

KING BARTLETT OF LAKE COUNTY.

[Written for the Pacific Rural Press by D. L. Kieffer.]

Eighty-five dollars a ton is the contract price paid Lake County pear growers this year by their local buyers and packers. The average sales were made at \$70, though a few contracts for \$90 a ton have been let on the last orchards bought. These contracts are for straight orchard run. Picking boxes are furnished free by the packer. The crop is of the finest quality they have ever known.

The pear is Lake County's chief claim to agricultural fame. The crop this year is estimated at 4,700 tons, and there are only 500 acres now in bearing. Five thousand acres more are either just planted or will come into bearing in the next few years. Four and five year old Bartlett pear orchards in the Kelseyville district, which is the main pear section, are selling for \$1,000 an acre and little acreage is being offered.

The packing houses all over the county opened on August 15th. Practically every pear in the county is sold to be dried. The shrinkage and drying loss of these pears is about 4 or 5 to 1. The sugar per cent is said to be 6 to 8 points higher than in pears grown in other parts of the state. The Lake County grower has another advantage. Because his fruit is dried, he can allow it to grow longer on the tree and obtain about one-fourth more weight than can growers whose pears go either for canning or eastern shipments. A pear 2½ inches in diameter is of a size best suited commercially for any other purpose than drying. Pear's intended for evaporation are left on the trees till they are of full size and will run up to about 3 inches when they are picked, and cut for drying as soon as they mature to a ripe condition in the pile.

Great care is taken in packing the dried fruit. It is put up in fancy retail boxes right in the county all ready for the consumer. Then it is hauled by truck to the nearest shipping point, which at present is either Hopland or Ukiah. As soon as the state highway is built to Sacramento, nearly all shipments will be made that way. This will constitute a great saving in time because the main markets for this product are found in the east. Canada and the United States take nearly the entire crop each year, very little going abroad. The chief buyers are Chicago and New York. Jobbers throughout the eastern states advertise the fruit under the name of "Lake County Pears."

The packer plays an important part in bringing credit to the pear of Lake County. The pears are cut, sulphured, dried in the sun for one day, left out for one night, then evaporated in the stack till completed. They are then graded into the classes of fancy, extra fancy and jumbo and last of all they are carefully hand packed.

So far all this labor has come from the local people. This summer 400 of them will be employed in the packing houses of the California Packing Corporation. This company has four plants in the county, and expects to pay out \$100,000 for help this season. Their largest dry yard, at Kelseyville, is said to be the largest drying plant in the world. It has been enlarged this year to take care of 3,500 of the 4,000 tons they have contracted in the county. Their pear contracts amount

to \$350,000 this season, according to Manager Renfro.

TIME TO PLANT CAULIFLOWER SEED.

August is the month to plant cauliflower. This delightful vegetable is particular about the temperature when it is heading. Too much warm weather will make the heads open up and toughen. Planting seed now and transplanting not later than October will put heading time during the cooler months.

Shipments of green pears to points outside the State to Aug. 5 were 2382

cars, compared with 1677 cars to the same date last year, according to E. E. Kaufman of the Bureau of Crop Estimates.

It's a John Deere Plow

FOR many years farmers everywhere have associated the name "John Deere Plow" with special plow quality—with better and longer plow service. Getting this quality is especially important when you buy a tractor plow. A tractor plow does work on a big scale—the quality of the work counts in proportion. A tractor plow must stand heavy strains—its ability to keep on doing good work year after year counts strongly in making plow profits. Remember, you get this special quality when you buy a

JOHN DEERE TRACTOR PLOW

Don't Forget

Good plowing is what you are after when you operate your tractor plowing outfit, and good plowing depends upon the plow. That's why it pays—always—to get the best plow you can buy. No matter what standard tractor you buy and no matter what type of soil you have to contend with, you can get a John Deere Plow, suited to your tractor and your soil, and thus make sure of good plowing year after year.

Sizes

Two-Bottom
Three-Bottom
Four-Bottom

Equipped With Genuine John Deere Bottoms—The kind that have an established world-wide reputation for long wear, good scouring and thorough seed-bed making. You can get the shape and type suited to your soil.

Holds to Its Work at Uniform Depth—It is locked into the ground at plowing depth through the action of the power lift. The land wheel is set back, balancing the weight of the plow over all three wheels, just as on your sulky or gang plow. Makes plow run steady and assures plowing at uniform depth in uneven ground.

Quick Detachable Shares—Strong and close-fitting. Loosen one nut to remove the share. Tighten the same nut and the share is on tight. It stays tight.

Extra Strong Construction—Extra heavy beams of special John Deere steel. We

guarantee them not to bend or break. Heavy beam braces, long, lapped and securely joined to beam with heavy bolts and lock washers.

High and Level Power Lift—Lifting mechanism is simple, strong and positive. Parts move only when plow is being lifted or lowered—practically no wear.

Three Sizes—Two-bottom, three-bottom and four-bottom. One of the sizes suits your tractor. And, remember, the adjustable hitch adapts the plow for use with any standard tractor.

Farmers Everywhere are making sure of continued good plow service behind their tractor by getting John Deere Tractor Plows. Your John Deere dealer is ready to furnish you with one. We will be glad to send you a folder describing the John Deere Tractor Plow. Ask for Folder TP-25 Write today for full information.

DEALERS GIVE BOTH

Corrugated Rollers for Firm Seedbeds.

(Written for Pacific Rural Press by P. G. Cunningham of the Dunham Co.)

One of numerous conditions that must be met by the farmers of California is the preparation of the ground to receive seed after dry-plowing or plowing done before seasonable rains have come, or in other words, the producing of a finished seed bed.

The methods used to convert dry-plowed land into a finished seed bed are many, as may suit the idea of each individual farmer.

All will agree that the necessary things to be accomplished in order to produce a finished seed bed are: (1) the eliminating or packing out of the air spaces or voids left by turning over the furrow; (2) the mashing up and pulverizing of the clods; (3) leveling the ground; and (4) leaving the top in a finely pulverized or mulched condition.

When these four things have been properly accomplished the soil condition gives better opportunity to distribute seed more evenly and cover more uniformly thereby, insuring a better stand and crop.

The packing out of voids or spaces left by turning of furrow and bringing plowed ground or seed bed back into close contact with bottom of furrow or sub-soil, provides the opportunity for attraction of moisture from below as well as conservation of moisture supplied from above.

Clods Worse Than Unproductive.

The elimination of clods is a most

essential thing in seed-bed preparation. A clod on a seed-bed when dried out, loses all of its productiveness.

In walking over growing fields left in a cloddy condition before sowing, one at times sees a clod with a plant growing out from under the side and on removing the clod discovers other germinated seed that had been smothered under this same clod. So it must mean that to whatever percentage of that seed bed this condition existed, so had the productiveness been reduced.

The leveling is necessary in all seed-bed preparation and more so when moisture is supplied by irrigation.

Leaving the top of seed bed mulched or pulverized is the best condition for conserving moisture as well as cultivation of growing crops.

The tools used for producing such ideal conditions are many, as best suits each individual's ideas, but the ones used most and in use longest are the disc harrow, spring-tooth harrow, spike or peg-tooth harrow, as well as various designs of drags, rollers, pulverizers, etc. In recent years these are becoming more popular with progressive farmers. Each season various styles of pulverizers and clod-crushers, the most popular of which is the double corrugated roller. This machine is made in various sizes to meet different requirements and works the ground to a space of every two inches. When used in connection with any of the other tools

named above, it produces a more perfect finished condition of seed bed than any other tool or combination of tools will do.

The double corrugated roller is built strong enough to carry any additional weight to meet extreme conditions.

The writer recommends the use of disc harrow, followed by the double corrugated roller, as being the best combination, used separately as horse-drawn tools and in combination when tractor drawn.

While there are exceptional conditions, this combination will apply to practically all conditions and localities and will greatly increase both efficiency and capacity for preparing a seed bed.

Agricultural colleges strongly recommend the use of the double corrugated roller in seed-bed preparation as well as on growing crops of many varieties.

A very interesting booklet, entitled, "Soil Sense," which treats on the many uses of the double corrugated roller as well as on general soil culture, can be obtained free of charge on request at any local implement dealer's place of business, or from Pacific Rural Press.

A San Francisco Grain Trade Association bulletin shows that 52,566 tons of California barley were shipped to Gulf ports by rail in June and 68,306 tons in July. Shipments to the same ports by water were 20,410 tons in June and 20,892 tons in July. Thus during June and July 162,174 tons of our barley went to Gulf ports.

ARMOUR IN CO-OPERATIVE CLOTHES?

(Written for Pacific Rural Press.)

That Armour & Co of Chicago have been masquerading in co-operative clothes by initiating and financing so-called co-operative concerns in order to tie up farm crops for Armour's profit is charged in proceedings recently instituted by the "Fruit Growers of California, Inc.," asking the Federal Trade Commission to institute proceedings against Armour & Co. and the California Co-operative Canneries of San Jose.

It will be remembered that only this summer Armour & Co. were found guilty of violating the Federal Trade Commission Act by controlling the so-called "Farmers' Co-operative Fertilizer Co." of Kansas City. Now it is charged that the Armour people own most of the California Co-operative Canneries, authorized \$500,000 capital stock, and that they control the crops which local co-operative associations bind themselves to sell to this outfit for a term of years at prices to be determined by its directors, who are chosen by trustees favorable to Armour interests. It is also charged that Armour has been given an option on 60 per cent or more of the output of the California Co-operative Canneries for ten years at prices also to be named by the same directors.

The complaint covers over thirteen long typewritten pages, going into great detail and naming Vernon Campbell, Ralph Crary, and James Madison (formerly manager of the California Associated Raisin Co.) as the three leading agents of Armour in carrying out the plan in the Santa Clara Valley.

This litigation will cost the Fruit Growers of California nothing, as their attorney, Aaron Sapiro, is donating his services. Mr. Sapiro is attorney for several other real co-operative organizations and in his work for them he has collected much evidence which will be used in the present case.

All the expense of prosecution will be borne by the Federal Trade Commission after the present complaint has been formally brought to their attention.

Co-operation in California has been so successful that it seems to have been used as sheep's clothing for other animals. Such masquerading must be stopped abruptly or the whole cause of farmers' co-operation will fall under suspicion and will be unable to hold the necessary farmers' support. Members of farmers' co-operative organizations should be especially watchful and should report all evidence of wolves in the flock.

Firestone

RED PARA TUBE

THE FIRESTONE TIRE & RUBBER CO. AKRON, OHIO.

PREFERRED and recommended by all tire dealers, Firestone Red Inner Tubes are best for most miles per dollar.

These Tubes are made by the antimony cure process. This gives them remarkable heat-resisting qualities, assures longer life to both tube and casing and gives the kind of service which is a real economy.

- Look for the name on the Tube—indication of the best of rubber and workmanship.

Suggestive Agricultural Pointers

(Written for the Pacific Rural Press.)

Barley and Malt from New York.

Barley and malt shipped out of New York City during the week ending Aug. 2 totaled 937,223 bushels of barley and 654,344 bushels of malt. South America took 243,875 bushels of malt. The United Kingdom took 444,501 bushels of barley and the Netherlands took 410,569 bushels.

Want Cheaper Farm Tools.

Duty on United States farm tools to Canada will be lifted if the Western provinces win their fight against the manufacturers of Quebec and Toronto. They wish the cheaper American product, but manufacturers do not want to compete without a tariff.

New Alfalfa Association Officials.

G. H. Emery has recently been elected manager of the Cal. Alfalfa Growers Inc. with offices at 525 Central Bldg., Los Angeles, according to Pres't H. R. Moses, who was re-elected to that office. Geo. Morgan, who has had great experience marketing for the Globe Milling Co., is now the Association's general sales manager.

Smut Treatment Made a Difference.

Three neighboring fields were seeded with wheat produced on one of them, which showed about eight per cent smut. The seed was treated before resowing on this field and this summer's crop is entirely free from smut. One of the neighboring fields was sod land. Seed for it was treated and the crop had no smut. The third field was across the road. Seed for it was not treated and the crop showed 25 per cent smut.

Stanislaus Aphis Control.

Aphids enjoy cool summer weather. If you have a spot infested when such weather starts, you had better burn it with straw or oil than to neglect it. Ladybirds and blackleaf 40 kill all the aphids they get at; but in a general infestation of cantaloupes, beans, and other garden truck the cost would be prohibitive. Tobacco-dust dry spray is being tried in Stanislaus county, where blackeyes, bush limas, melons, and cantaloupes became badly infested in the cool weather of late July. The natural check is some more hot weather.

Late-Sown Wheat on Early Plowing.

W. H. Gerlach of Dixon has 250 acres of Club wheat in the Rio Vista country that they finished sowing on the 20th of April last. It is now ready for harvest and promises a yield of 20 sacks per acre according to expert judges. The ground had been plowed early in the season, but was packed very hard by later rains. Instead of plowing again they merely made a surface seed bed and wheat broadcasted on this and harrowed in. The crop is excellent but it would have been enormous if there had been even an inch of rain after sowing. The crop as it is was grown without any rainfall after sowing whatever.

To Hay Sellers.

"You are invited to submit your offer by letter in triplicate, to arrive here not later than August 30, 1919, envelope to be marked 'Overseas Forage Bid, opening 11 A. M. Aug. 30, 1919,' such quantity as you desire to bid on up to 2725 tons of hay for Manila and 1250 tons for Honolulu. Hay will be preferred with mixture 1/2 alfalfa. Delivery to be f. o. b. cars or within reach of ship's tackle by bidders to be stated in bids, between date of award and Dec. 31, 1919, at Government's convenience."—C. A. Devol, Zone Supply Officer, Fort Mason, San Francisco.

Foreigners Trying to Buy Our Wheat.

Foreign wheat buyers have been exerting great pressure on Federal Wheat Director Julius Barnes to allow them to buy supplies enough at present prices to last them for months ahead. They seem unable to get supplies from other sources. But the Grain Corporation of which Mr. Barnes is the head is refusing all such business, until the corporation gets enough wheat to assure protection for our future home requirements. Most producers are selling to

mills and dealers, paying them the two per cent which they are allowed to charge, because of their greater advantages. The foreign demand seems to indicate that wheat is likely to go higher before it goes lower.

PACIFIC STATES POTATO ACREAGE.

Lack of punctuation in our potato article published August 16 makes us say that Oregon, Washington, and Idaho have a "combined acreage this year of only 45,000, or about 50 per cent greater than California." This should have read "combined acreage this year of only 45,000 (or about 50 per cent) greater than that of California. Acreages for these States are as follows: California, 88,000; Idaho, 30,000; Washington, 58,000; Oregon, 45,000.

MOLINE CHILLED PLOWS

See your Moline Dealer or write us for full information.

With a Money-Saving Guarantee

We will replace, free of charge, f. o. b. factory or branch house, on receipt of broken parts, any Moline Chilled Moldboard, or Moline Malleable Frog, broken in actual field use.

We can do this because Moline Moldboards have a soft, tough, grayback, which resists shocks and strains, yet the face of the Moldboard is glass hard and takes a high polish. No other chilled plows have such a guarantee.

You know this guarantee will save you money—insist on getting the better guaranteed Moline Chilled Plows.

Moline Plow Co.
Moline, Ill.

BOSCH

The Greatest Dual Farm Service

THERE is one combination that has stood supreme through years of Supreme Service—a properly designed gas engine and Bosch High Tension Magneto Ignition. Under the strain of farm service Magneto Ignition is a necessity. And no magneto can approach the performance record of the Bosch Magneto.

Rip Roaring Bosch Sparks on your tractor—gas engine—truck or automobile, will cut your operating costs, increase the dependability of your engine, and get more power from any fuel.

When you place your order for any piece of gas engine driven machinery be sure it's Bosch Magneto Equipt.

If your engine is not now Bosch Equipt, get in touch with the nearest Bosch Service Station, Distributor or Dealer. He has a Bosch Magneto ready for you now.

AGRICULTURAL NOTES

Byron alfalfa seed growers pay \$8.50 per ton of cleaned seed for cleaning and sacking it.

Rice fields of the Cottonwood-Anderson district of Shasta county are showing splendid growth and color.

The Hawaiian sugar crop is forecasted at a greater tonnage than ever before except the years 1914, 1915, and 1917.

The biggest crop of rice is predicted and the biggest prices are being offered of any in the history of rice growing in this State.

One hundred and eighteen sacks of "hull-less" oats are reported to have netted \$729 for C. W. Vannote of Butte county this summer.

Dried peas are reported to have yielded 4200 pounds per acre in the bag in Sacramento Valley. They sold at five or six cents a pound.

Tomatoes in the Ripon section are coming on. The crop is not as heavy as expected but the prices are so good that the same return to the farmer is made with less bulk to handle.

Sudan grass planted last September made good dairy feed for the herd of A. Schmitt in San Joaquin County. He is planting some in August this year.

The Oakdale and South San Joaquin Irrigation districts have agreed to share the expense of improving their joint works on the basis of 19 and 81 per cent respectively.

The Cantaloupe season is closing up. Growers are cleaning up their fields and shipping the last of the crop. The season has been a very successful one, growers being very satisfied with prices and conditions.

The State highway from San Diego to Yuma, via El Centro, is to be paved as decided by the California State Highway Commission recently. Bids are being called for the grading of part of it.

A stretch of State highway through the Adobe rice fields north of Biggs is to be built of six-inch concrete, reinforced with steel, all on top of a graveled subgrade. The pavement from the southern county line to Biggs has been completed.

The alfalfa seed crop of California is now ripening and will be unusually heavy. A considerable portion of the crop has already been bought for eastern shipment, at prices that will net growers better than 20c. per pound.

Sweet potatoes are beginning to come on the market in quantities at Turlock. There is a heavy acreage in the district and the crop is good, although winter rains were not heavy enough here and in Merced county in certain sections to prevent drying out of fields.

Hops at Wheatland have two harvests this year as the young vines planted by Durst Bros. and E. Clements Horst have matured later than the old vines and will not be ready for picking, until September 1. The first crop is practically harvested.

Immigration laws have been suspended to allow Mexicans free passage into U. S. to supply the prospective shortage of common labor and

cotton pickers. Arizona alone foresees a shortage of 8,000 cotton pickers. There is some surplus of common labor in Los Angeles.

About the only local effect of the U. S. food price investigation has been the drop of barley about \$8 a ton at Porterville. Barley selling for \$2.90 before investigations dropped to \$2.65. However ground barley and all mill fields have advanced to the highest prices known in California.

The Canadian government proposes to buy the entire wheat crop direct from farmers and sell it on the world markets. A cash payment will be made to farmers on delivery and the balance will be prorated to the producers after the expense of marketing is paid.

The Newlands project near Fallon, Nev., figures that the crops of the valley will approximate \$2,000,000 this year. This sum is set by figuring 100,000 tons of alfalfa hay at \$15 per ton and adding conservative estimates of the cereals, potatoes, fruit garden truck and stock that will come from the project farms.

Potato yield in Idaho last year was about 240 bushels per acre. The acreage is about eight per cent greater this year, but the average condition is but 71 per cent of normal as against 90 per cent a year ago. The crop will be considerably smaller than last year. Idaho potatoes compete strongly with the California crop.

Kern county is not growing the commercial castor bean this year, as successful farmers believe other crops to be more profitable on good land, and the poor land tried last year was not a success. The Castor Bean Association paid \$4.50 to \$5.90 per 46 pounds bushel last year, but the oil is no longer wanted in quantities for airplanes.

The Beaumont Land and Water Company has asked permission from the Railroad Commission to raise its rates of irrigation service from \$6 to \$14.40 per acre, and from 1½ cents per inch hour to 5 cents. The San Geronio Water company which obtains its water from the Beaumont company, has asked for the same increase. Both companies have been financially pressed since 1914.

Estimates of from 75,000 to 100,000 tons of alfalfa hay from Fallon, Nev., have been made. Large numbers of sales have been made at \$15 and \$16 per ton. Many farmers however are holding for better prices in the belief that the extraordinary range conditions throughout the inter-mountain states will result in further advances of hay prices. Many stockmen are looking to this section now for feed and the community is prosperous.

California bean crop will be 60 per cent of last year's decreasing 2,150,000 bags. The yield for the state is placed at 3,000,000 bags as against 5,150,000 bags in 1918. Decreased acreage amounting to over 25 per cent is given as the main cause. The Santa Maria district shows poorly but the Salinas district is fair. The remaining supply of 1918 beans in warehouses is estimated at a little over 1,000,000 bushels of which growers hold 85 per cent.

COTTON SUPPLY BIG—BUYERS GET RICH.

The total visible supply of cotton in the world July 18 as reported by the U. S. Dept. Agr. was 4,927,937 bales in 1919 as against 3,296,644 bales in 1918, 2,968,854 in 1917, and 3,484,791 in 1916. Of the total supply, 3,336,937 bales were American cotton in Europe and U. S. There were 1,180,985 bales in U. S. ports and 933,604 bales in U. S. interior towns. This report indicates the world supply of cotton to be over 1,500,000 bales greater than a year ago. This is nearly a 50 per cent increase in supply. Have you tried to buy any cotton goods lately? Are they cheaper than in previous years when the supply was less? Are our cotton growers getting any fair share of the outrageous prices of finished cotton goods? The U. S. Dept. Agr. Bureau of Markets recently investigated in North Carolina, South Carolina, and Georgia the difference between prices paid to farmers and prices paid by mills. Sales of about 200,000 bales were studied. It was found that "the mills paid an average of \$11.60 per bale more than the average price received by the farmers on the same date for cotton of the same grade and staple." It was figured that freight and other legitimate handling charges might average \$2.50 per bale. Middlemen were getting \$9.10 per bale for the trouble of buying and selling this cotton. The remedy is obvious to anyone whose penny is not plastered over his eye. With a big world supply now on hand, cotton buyers will hammer down the price to growers out of all proportion to what the growers are entitled—unless the growers market co-operatively.

Five Reasons Why

Farmers Buy AVERY Tractors

- 1st. They satisfy and stay sold.
- 2d. They cost less to operate and keep up.
- 3d. Their simplicity of design and construction appeals.
- 4th. They are now made in EIGHT sizes to meet the requirements of any size ranch, orchard or field.
- 5th. The AVERY Company backs its products with a reputation and experience of over FORTY YEARS' standing, and builds its machinery (motors and all) complete in their own big factories. THEY are not assembled.

THE PACIFIC PUMP & SUPPLY CO.

San Francisco

ALFALFA IN PEACH ORCHARDS.

(Written for Pacific Rural Press.)

In the Selma district the common idea about alfalfa in peach orchards is that it should not be there until the trees are about played out and the intention is to remove them in a couple of years. Around Exeter, on the other hand, quite a few peach growers have alfalfa in their orchards, and whether a heavier soil than in the Selma country is responsible for it or not is hard to say.

Some of the finest Lovels we have seen were growing on the trees of M. E. Ickus of Exeter; a heavy set of well thinned fruit was giving a heavy tonnage of beautiful peaches and Ickus claimed that yield and quality were both improved by the alfalfa, which, he said, took the water into the soil better than it would otherwise go. He finds that the alfalfa needs the water more than the peaches, and two irrigations per cutting keep the trees in perfect condition. Mowing is a good deal of trouble, and the scythe has to be used along the tree rows, but cultivation is saved and all the stock on the place is fed from the orchard, the alfalfa yield running from five to six tons per acre at an estimate. The alfalfa is not planted in strips, but

right up to the trunks of the trees. Irrigation is from a private pumping plant and plenty water is always available.

OLD RELIABLE PEACHES.

Peach trees are considered short-lived, owing to the way root and branch troubles injure many trees,

but given a good start and proper care they keep going nicely. The 10-acre Phillips and Elberta orchard two miles north of Selma, owned until a short time ago by S. C. Nielsen, proves that. Many orchards much younger are played out, the only misses in this orchard being where three young trees died years ago, others not succeeding in their place. The clings

were planted in 1902, the freestones a little later. Mr. Nielsen attributes their condition to healthy roots, grown from properly selected seeds, and to good care. The trees have always been sprayed twice a year and the rule in pruning has been to cut off all the new wood that the tree would stand and to have the new shoots remaining about 8 to 10 inches long. The normal crop of the clings has been from 50 to 65 tons from 480 trees, and the freestones have done nearly as well.

The fact that peach orchards in practice are rather short lived and that peaches cannot be always successfully re-established on such land causes the peach acreage in long settled localities to be limited, and gives the settler on new land a good chance at the market. The way that prices are and promise to be, this chance is a good one.

Because of intense neat in the Fresno section recently the Malaga grape crop was injured about 25 per cent. Eastern grape shipments will commence soon.

Thousands of acres, hitherto devoted to grain raising, are to be planted out to trees and vines in the San Joaquin and Sacramento valleys the coming season.

SPRAY OLIVES NOW FOR BLACK SCALES.

(Written for Pacific Rural Press.)

Now is the best time to kill the young black scale, just after they have hatched out. If miscible oil is used, it is safe to adhere strictly to the directions that come with them from any accredited manufacturer. Soap powders meet with good success. They are put up in barrels and are readily and easily mixed—about 40 pounds to the tank (200 gallons). If only needed for a tree or two in the yard, buy some Gold Dust Twins or any similar washing powder and use that. It is safe to apply. The emulsions need a good agitator to the pump to insure their not breaking up. If the trees are pretty smutty, they probably need spraying. No need for Butte County growers to worry that we have seen yet.

The following important details are published by E. O. Essig in his article on Olive Insects (University Bulletin IV:238): "In case of doubt as to strength of materials to use, spray a few trees to ascertain results before treating the entire orchard. Never spray when the orchard is in need of water, as severe burning of fruit and foliage may result. Irrigate first or wait till after the first rain. Do not spray during excessively hot weather or when hot winds are blowing. Do not spray within several weeks before picking if possible as spotting of the fruit may result."

WATER AND FEED

The question of water and feed is the farmer's greatest worry. Stock must have both. A hot day in summer without water, or a scarcity of feed for a few days in winter can easily wreck your dairy profits for the entire year.

Dairy cows will not give milk unless properly fed. The surest way to feed is from a silo. By putting your green crops into ensilage you have a feed that is more nourishing, goes farther, and is an insurance against shortage during the winter. It is the one logical way to feed a dairy and is the secret of dairy success.

The **IDEAL GREEN FEED SILO** is built to meet every requirement, give maximum service and yet be sold at a reasonable price. It is strong, serviceable, convenient, and will last a lifetime.

THE IDEAL GREEN FEED SILO

has been perfected after many years of experience. Practical knowledge of the needs of the farmer and stockman, as well as technical skill on the part of our engineers, is embodied in the features of this silo. Every piece of material that enters into its construction is selected for its lasting qualities.

Staves are of the finest grade California Redwood—a wood famous for its long life and resistance to fire and decay. They are tongued, grooved, bevelled and splined with the greatest accuracy by special machinery. Doors are like those of a refrigerator or safe, airtight and leakproof, with three points of contact instead of one. They come flush with inside surface of silo.

Other features are: Heavy round hoops of soft steel, with cold rolled upset threads; straight-pull malleable iron lugs; one-piece door frame; well-built ladder at one side of doors; self-supporting, conical roof and leak-proof foundation joint.

Send coupon for booklet containing full particulars and prices of **IDEAL** silos.

HOW ABOUT THAT WATER TANK?

Let the **PACIFIC TANK** take care of your needs. Put in a system and have water all the time and where you need it. Water for your stock, dairy, kitchen, bath and lawn. A life-saver in case of fire.

PACIFIC TANKS

are built of heavy Redwood and bound with large steel hoops. Strong and everlasting. Fitted with patent non-shrinking system. Cannot shrink, leak, or burst. Always tight.

Write us about our non-shrinking system. Find out why it is that a **PACIFIC** never leaks. Write today.

Pacific Machine-Banded Wood Stave Pipe is best for farm and irrigation purposes. Made in all sizes. Write for circular and prices.

Mechanical Power on the Farm

TRACTOR APPRECIATED ON DAIRY RANCH.

"Twas with a feeling almost of wonderment that we looked out across a plowed field in Contra Costa county recently and watched the 15-25 tractor reaching out like a race-horse, though not so fast, and followed by three rolling waves of thick alfalfa sod. The outfit seemed to be moving swiftly without hurry—seemed to be turning those furrow slices fourteen inches wide and all of six inches thick as easily as a race-horse pulls his pneumatic-tired cart.

Manager E. H. Fox of the Central Creamery Co. was showing it to us; and the machine was driven by Hans Larsen, who regards it almost as if it had a soul.

Works Better Than 21 Horses.

Six horses had tried to turn similar sod on this place in slices twelve inches wide. It would have taken 21 horses to turn the 42 inches width that the tractor was laying over as easily.

"Yes," said Mr. Fox, as we drew near, "but 21 horses doing as much work as that would have to rest at the end of every round, or oftener. And the tractor is running 2½ miles per hour, but the horses wouldn't step it off like that. Notice this black adobe, neither wet nor dry, and penetrated by tough alfalfa roots.

"The ranch includes 200 acres. We try to keep half of it in alfalfa all the time, but the land is low and the alfalfa short-lived. With so much to plow up each year we can't get it done. We would come far from getting it as nearly done if we depended on horses. We have to plow at this season. If we let it go until rains moisten the land, it would get too wet to turn over and work down right.

"You notice some of the chunks it has turned out here are nine inches thick. That would make rough traveling for horses at the grueling work of disking. But the tractor glides over them beautifully and pulverizes most of them."

Work Done at Low Cost.

The Central Creamery Co. has eleven strings of cows on this ranch; and it is a necessity that a great deal of feed be produced. The tractor has leveled a 25-acre bump for alfalfa and has prepared seed beds for a great deal of crop acreage in the year it has been at work. The only repair part they have had to pay for was a pinion recently replaced. The machine, according to Mr. Larsen, uses 20 to 21 gallons of distillate per ten-hour day and ten quarts of lubricating oil run it three days. After cleaning out the crank case, six quarts of heavy duty oil are put in. Next morning two quarts are added. Next morning two quarts more are added, and after that day's work all of the oil is taken out. Replacement of the oil is necessary, not because it gets dirty, for the outfit is dust-proof and has a centrifugal air cleaner which takes practically all of

the dust from air that goes into the cylinders. The oil simply wears out. It is designed and expected to take the wear that otherwise would reduce the steel to nothing. And fresh oil is cheaper than new steel.

SOUTHERN TRACTOR DEMONSTRATION.

The largest working exhibit of power farming machinery ever shown in California; and in addition, a tent 100x350 feet full of motor trucks, trailers, and accessories of all kinds will be staged at the fourth annual demonstration of the Traction Engine and Implement Dealers' Association of Southern California on the Rancho La Brea near Los Angeles, September 16 to 21, inclusive. Lower costs of producing farm products will be obtained by ranchers who visit this demonstration and put into practice what they learn. To save labor and do more work—that's the great value of power farming. Many a man will at this demonstration see the light which will lead him on to fun and fortune such as so many others have already found. Admission and parking space will be free.

Among the exhibitors will be the B. Hayman Company, who will enter a full line of Oliver Chilled Plow Works Implements, a complete line of Emerson, Brantingham, the E. W. Ross Feed Cutters, Planet Jr. Line Forkner Cultivators, and a new line of Roderick Lean Disc Harrows.

The International Harvester Company have listed the 10-20 Titan Tractor, the 8-16 and 15-30 International, and a most complete general line of International and P. & O. Implements.

E. P. Bosbyshell Company will exhibit two sizes of Heider Tractors, full line of Rock Island Plows, W. W. Alfalfa grinding mill, Clark Cut-Away Harrows, Sandwich Hay Press, Knapp Disc Harrows.

William L. Hughson Company will exhibit Fordson Tractors, special line of Oliver Plows for Fordson Tractor, special line of Roderick Lean Harrows; also the Amsco Drills.

F. T. Briles Company will display the Bates Steel Mule 15-20, Bernice Chisel and Subsoiler, Schmeiser's Land Levelers, F. T. B. Disc Harrows.

Wm. Gregory & Sons will display the Trundaar Tractor.

Motor Equipment will exhibit and demonstrate Beeman Tractor with complete line of Implements for same.

PUMP DRAINS ALFALFA FIELD.

(Written for Pacific Rural Press.)

You may have one of many fields in Western States which are so waterlogged that alfalfa cannot live long. It is some of your best land and is approximately level. It is quite likely that a creek nearby could carry the water off. Maybe the water level in the creek is as high or higher than the level of the field.

E. H. Fox of Contra Costa county has such a field and he has grown alfalfa on it. Ditches are dug, all leading to a pump at the levee, which keeps Sacramento river water from flooding his fields. But the alfalfa is short-lived because the ditches are not deep enough and the pump is too big. It throws 5600 gallons per minute and drains five miles of ditches in a hurry. But about the time enough water has been pumped out to begin to really drain land along the ditches, the pump has to shut down for lack of water to keep it going. Deeper ditches would give alfalfa enough root room, and a smaller pump run constantly or operated by an automatic starter and stopper would keep the water level low enough to get full advantage from this good land.

AIR-COOLED GAS ENGINE.

An air-cooled gas engine is on the market—quite a nifty, compact, upright, little single-cylinder machine of six horsepower. The cylinder has a honey-combed jacket. A sheet-iron hood covers the jacket except on one side and extends down over the fly-

wheel. Beside the flywheel is a fan which pulls air through the honey-combed jacket and the hood to keep the cylinder cool. The engine operates by magneto ignition.

P. E. Talbott of southern Monterey county has been denied permission to haul grain on the State Highways with a tractor and four steel-tired trailers.

Sandstrom Tractor Scraper

Operated by ONE MAN from Tractor Seat

CUT YOUR LEVELING EXPENSES IN HALF. THE SANDSTROM TRACTOR SCRAPER is a practical ONE MAN machine, for the leveling of fields, orchards and vineyards, and for the building of roads. It is a much-needed labor and money-saving device for the farmer's use, and solves the problem of hiring labor.

It is absolutely practical and proven by the satisfied owners who have used it in the past two years.

Note its construction. So simple, and so well made that no parts can get out of order. A compact ONE MAN machine, operated by the driver from the Tractor seat. It can do the work of 3 or 4 men with a 4-horse team **AND ALL DONE BY ONE MAN.**

Send **TODAY** for our **FREE ILLUSTRATED CIRCULAR** that fully describes what the Sandstrom Tractor Scraper will do for you, on your farm. A postcard will bring you full information.

MADE IN FOUR SIZES

BARNEY SANDSTROM

1822 Nason Street,

Alameda, Calif.

Pay For 12-20 Horsepower And Get Full 15-25

PUT the E-B 12-20, S. A. E. Rating, Model AA Tractor to work on your farm. Use it with the E-B 102 Tractor Plow. This is a combination that stands up to the hardest plowing with plenty of Power, Dependability, Economy, Ease of Handling, and E-B Service backed by capable, helpful dealers who know tractors.

Surplus Power—because the 12-20 rating on the S. A. E. basis is the most conservative known, 25% extra power.

Dependability through 67 years of implement manufacture and 12 years of tractor building. Enclosed gears, high-grade materials and equipment, such as Hyatt Roller Bearings, K-W Magneto, high-grade Radiator, etc.

Economy—25% greater power with less weight. Kerosene motor cuts fuel cost.

Ease of Handling—E-B Auto Control. Ask your dealer for complete facts.

Brock and Skidmore
Berkeley, Cal.
Farm Tractor and Imp. Co.
Portland, Ore.

THE E-B 102 TRACTOR PLOW
Plows More Acres Better With the Same Fuel
Easy to handle and easy to pull. E-B Quick Detachable Shares make furrows turn with less kerosene cost. Sharp shares plowing readily done when shares are so quickly applied and removed. Sharp shares keep channels of moisture circulation open—better soil conditions.

The King of Farm Implements

Here's another King of farm implements. It's the new light draft, roller-bearing Brilliance King Soil Pulverizer that's not only King in name but King for helping you raise bigger crops. With it you so crush every clod as to loosen up every plant food particle for quickest seed sprouting, growth and easier cultivation of young plant. Packs under soil for holding the

necessary moisture for quickest future growth, and greatest possible crop yield. Fine for early cultivation of all crops and packing wheat. Made for team or tractor. Price reasonable, light draft, strongly built. Get one **AT ALL JOHN DEERE DEALERS**

ELECTRIC POWER SHORTAGE.

(Written for Pacific Rural Press.)

There is an increasing demand for electric power in California which is boosted by the early seasonal failure of some irrigation systems. There is a decreasing supply of power due to the same water shortage which helped to bring the increased demand. Under such condition, if power companies were free to charge all that the traffic would bear, we might be paying all kinds of high rates and the man with the most pull might be getting the juice while the other fellow's crops dried up. Fortunately, our power rates are not based so much on supply and demand as upon the cost of production plus a reasonable profit as determined by our State Railroad Commission.

The short facilities for power production are largely due to lack of development during the war and to the increasing number of farmers who see that pumping for irrigation pays in added crops produced.

But the shortage is at hand, and something must be done quickly. The Railroad Commission is sending out parties of engineers to inspect existing fornia, and is asking full co-operation of the power companies without ne-plants in northern and central California of a formal investigation. It is hoped that the engineers will see opportunities for new construction and for strengthening of existent works that will make possible a comprehensive plan for extensive development of our natural power resources.

SURE PUMP IRRIGATION FROM RIVER.

(Written for Pacific Rural Press.)

The surest source of irrigation water is the best, as many ranchers have become convinced this year. Those ranchers located within a few miles of never-failing streams are lucky in this respect. A great many new irrigation districts have been formed to pump water out of the rivers in a wholesale way. One of these is "The West Side Irrigation District," which waters 11,000 acres of the Tracy plains by pumping water from a canal opening from the San Joaquin river, not far from Bethany.

Four pumps are operated by motors of 325 horsepower, each as stated by Chief Operator J. R. Lubeck, and three pumps are operated by 200 horsepower each. Each of the seven pumps throws about 7,000 gallons per minute and all of them are at the one station. Those using the greater horsepower force water 800 feet through 48-inch concrete pipe and about two miles through redwood stave pipe to a point at 105 feet greater elevation than the pumping station. There it emerges into ditches and is distributed by gravity. The pumps using 200 horsepower each force the water through about 800 feet of 44-inch concrete pipe and one-fourth of a mile through redwood pipe to an elevation 48 feet above the pumps.

Water first became available a year ago last spring, but most people could not get it and were not ready for it even this spring. Alfalfa, beans, and corn are the chief crops irrigated, but some ranchers plan to irrigate this season so they can plow early for grain.

UNIVERSITY FARM TRACTOR COURSE.

Over a dozen makes of tractors will be studied and operated by students at the University Farm Tractor Short Course at Davis September 16 to 25. The only charge is a registration fee of \$1. The course is limited to 180 students. Every minute of the time will be spent in hearing lectures and in practice work with the tractors. The principles of a gas engine, ignition, carburetion, valve grinding, forge work, etc., are just a few of the studies to be made. We personally know the intense interest taken by most students and the practical value given in the course, so we recommend every tractor driver or prospective tractor driver to try hard to be one of the 180.

POWER NOTES.

The motor trucks being distributed by the Federal Government for work on Federal Road Aid projects are not allowed to be used on other road work. County Boards of Supervisors have been asking for use of these trucks.

An Italian near Stockton, who had never operated a motor truck, paid cash for a one-ton truck a little over a year ago. He has had no serious troubles and has not even taken up the bearings, although he makes a practice of hauling two tons of farm produce per load.

When the International Harvester Co. bought the P. & O. line of steel plows last spring, they still lacked a line of chilled plows. This was added to their business June 1 by purchase of the Chattanooga Plow Co. The latter has been making chilled plows since the 70's, when Newell Sanders put up a building, which is still in use, but is nearly lost in the added buildings put up since then for the expanding business.

A ten-foot rice binder, mounted on the front of a Monarch tractor so the tractor may cut all grain instead of trampling down some of it on the first round of every check, is on exhibition at the Sacramento Valley Tractor Co.'s office in Sacramento.

Thirty motor trucks will replace about 4,000 camels and 1,000 men in transporting supplies from Tien-Tsin to agricultural colonies in Eastern Turkestan and in carrying farm products out. They will make the trips somewhat faster.

We recently found a man who is not managing his work in a way to get nearly what he ought out of his garden tractor. With a big flock of hens and irrigation for two or three

acres, he has absolutely no green stuff to feed. He uses the tractor a little every now and then. He leaves his plow caked up with dirt when he isn't using it. Such a man probably thinks the tractor doesn't pay.

Cletrac

TANK-TYPE TRACTOR

(Formerly known as the Cleveland Tractor)

Plows on the heels of the Harvest

The actual experience of farmers everywhere proves conclusively that wheat yields are increased from 5 to 8 bushels an acre by plowing immediately after harvest.

But this is usually the hottest and busiest season of the year when men and horses tire easily.

With the Cletrac Tank-Type Tractor you can actually plow right on the heels of the harvest—and do it so quickly that you will not interfere with cultivating, haying or other routine work.

Through the most extreme heat the Cletrac contentedly and steadily does a job that would kill a team. It will work all day and all night if necessary. You can drive it unmercifully—and in return get an increased yield of better quality, that will often pay the whole cost of the tractor in one season.

Prompt plowing after harvest enables your soil to soak up and store away moisture that would otherwise be lost.

But remember the Cletrac does far more than merely plow. That is only the beginning of its work. Its distinctive tank-type construction en-

ables it to go almost anywhere—particularly over soft plowed ground or moist or sandy soil where the average tractor would flounder or "dig itself in". All the power of the Cletrac is used to pull the implement. And because of its 600 square inches of traction surface it doesn't leave two packed down tracks of earth behind it.

The Cletrac is extremely economical to operate, using kerosene, distillate or gasoline. Most owners are using kerosene or distillate.

Send for our booklet "Selecting Your Tractor". It will be a real help in solving many of your most difficult problems. And order early as we cannot promise prompt delivery later on.

The Cleveland Tractor Co.

19079 Euclid Ave., Cleveland, Ohio

The Purebred Way Makes Livestock Pay

Written for Pacific Rural Press by R. H. Whitten.

The scrub sire has done more than drought or flood, more than insect pest, more than rodent and beast of prey, to reduce our agricultural wealth and to cut down the money returns of the individual farmer.

But the day of the scrub sire is drawing to its dusk. Preached against for generations, he is now to be actively crusaded against in every state, county and community in the United States. As already announced in our column the drive begins on the first of October. To be officially enrolled, one must own live stock, but not on a large scale. The owning of one animal of breeding age is sufficient. If a male, it must be purebred. If a female, it need not be purebred, but must be bred to a good purebred male. Therefore, the person who owns just one mongrel hen, mated with a quality cock representing a definite breed, is entitled to offi-

ever, show that there is a very marked improvement in the first generation. With some breeds the offspring of a purebred sire and mongrel dams are, in practical appearance, like purebred animals. A Hereford bull practically never fails to stamp his progeny with the characteristic white face of the breed. Chickens from a standard-bred Barred Rock cock and any kind of mongrel hens are nearly all Barred Rocks in appearance, and usually when mature they are at least two pounds heavier than mongrels.

Profitable Herds from Unprofitable Stock.

The external improvement may not be so marked in other breeds in the first generation, but the intrinsic improvement is undoubtedly just as great. However, the improvement in the two breeds cited is not merely in

Too much near-breeding has been raised. Too many near-bulls have been used. A registered bull of real quality will work wonders in a herd in one generation. Notice how much more closely this calf resembles its purebred sire than its scrub dam.

cial enrollment as a crusader for "Better Sires—Better Stock."

With all due respect to the cow-testing associations, breeders' associations and other agencies that have done a vast amount of good, this national better livestock crusade is the biggest thing that has ever been started to improve the livestock of this country. For years agricultural colleges and other agencies have been telling about the improvement that could be wrought by the use of pure blood. A few men believed the teachings and changed to registered sires, but the big majority of farmers continued in the unprogressive rut of mating animals irrespective of breed or blood lines.

Perhaps most of those who remained in the rut had an idea that the grading-up method required almost a lifetime. Actual results, how-

appearance. The Department of Agriculture proves that by the case of a 800-pound part Jersey cow bred to a Hereford bull. The calf, at a little over two years, weighed 1,650 pounds—more than twice as much as the cow. With practically any breed of cattle, swine, sheep, horses, goats or poultry, a scrub herd, headed by purebred sires for three generations, will show most of the individuals closely resembling purebreds, and practically as useful for food-production purposes.

The high-grade cow resulting from wise breeding produces more milk, richer in butterfat, than the ordinary cow. A circular just issued by the Nebraska Experiment Station cites the records of three sires used in the University dairy herd. In the first case the average increase of the production of the daughters over that of their dams was 42 per cent in both butterfat and milk. The second sire produced two daughters that showed a 100 per cent increase over their dams. The third had daughters that, during their first lactation periods, beat their mothers, even though the mothers were among the best-producing cows ever owned by the University.

Grade Herds Need Good Bulls.

Hall Brothers of Colorado, whose grade Holsteins brought such high prices a few months ago, started with grade cows and bought the best bulls they could afford. They built up a herd that was more productive than most purebred herds, and sold cows for higher prices than many purebred cows bring. They got rich on the idea that a grade herd needed even a better bull than a purebred herd, because in a grade herd the bull has a larger task to perform.

Then, too, when they wanted to add a few purebred heifers to the herd they had good enough bulls to breed them to. They reasoned that a bull that was good enough to use on a grade herd was certainly good enough to use on a purebred herd. Their success indicates that their reasoning was correct, and if so, many men reason backward when they say, "If I had purebred herd I would buy a high-priced bull, but I have only grades, so a cheaper bull will do just as well."

Dividends from Good Bulls.

The proper breeding of beef animals results in better and more uniform stock, maturing earlier, and having a greater percentage of desirable cuts of meat and a smaller quantity of bone, offal and inedible parts. Such stock, of course, commands much better prices at the markets. The

Shorthorn World says that only a few months ago three carloads of native southern scrub cattle, averaging a trifle under 560 pounds, were sold for 8 cents per pound at a Georgia market. At about the same time a similar number of grades, averaging 1,050 pounds, brought 12½ cents per pound. The droves came from neighboring sections. They were sold on the same kind of market and each shipment sold for its full value. Why did the grade lot sell for 4½ cents per pound more than the scrubs? The question is easily answered in two words—purebred bulls. The registered beef bulls had stamped their characteristics upon these grades, which gave them the low, blocky appearance of beef animals, for which packers are willing to pay good prices.

Quicker Route from Piggish to Pork.

In the same way, while a hog is a hog in the general sense of the world, still all hogs do not look alike to the packer. He seeks those that show the maximum of quality, and a purebred top on the hogs means that he will pay a better price. This is because he has learned that a purebred boar is a guarantee of good quality and uniformity. The packer is always seeking hogs of the best quality, for they dress out the best and prove the most profitable in the end. The better meat yield cuts down the purchase price, and that is why he is willing to pay a premium for hogs that show the stamp of a purebred boar.

Scrub Stock Must Go.

Has anyone ever seen a really successful farmer who used scrub sires? No, impossible! No one can be really successful as long as he uses a scrub bull. If you have one on your farm get rid of him quickly. He is a slacker, a boarder, a loser, and every day he stays on your farm means another day before you can start on the road to success.

How this "Better Sire" campaign may be expected to work out can be judged from the results of a drive in Webster county, Missouri, where a bull association was started in June, 1918. Before the association was organized the 18 bulls in the community were valued at \$1,355—an average of \$75.28. One or two of these were purebreds and the rest were largely scrubs of mixed dairy and beef breeding. After the association was formed these nondescripts were disposed of and six purebred dairy bulls were purchased at a total cost of \$1,657—an average of \$276. The more efficient utilization of the association bulls resulting from organization of the association made it possible for the six purebred bulls to take the place of the 18 bulls formerly maintained. The reduction in the number of bulls also resulted in a corresponding reduction in the cost of maintenance to be charged to each cow.

The passing of the scrub sire in all other sections of the United States is at hand. Welcome the day when the sun sets on the last critter.

CAUTION

Do Not Be Deceived

There is only one GENUINE O. M. Franklin Blackleg Aggressin (commonly called Vaccine).

Beware of imitations. You can not afford to have anyone experiment on your animals.

Accurate use of the Genuine O. M. FRANKLIN Blackleg Vaccine positively protects against Blackleg.

Be absolutely safe by using the ORIGINAL and GENUINE manufactured by THE KANSAS BLACKLEG SERUM CO., under the direct supervision of Dr. O. M. Franklin, the ORIGINATOR.

GET A HOLSTEIN BULL NOW

It doesn't cost much to make a start, but every year it will cost more. Some of the most successful and prominent Holstein men started with only a few purebred animals in connection with a number of good grades, gradually working out the grades and replacing them with purebreds.

Grade up your herd with a purebred Holstein sire. Then when you're satisfied that you're on the right track, you'll feel like getting a few cows. Any good Holstein does the work of two ordinary cows.

PURE BRED JERSEYS AT PRIVATE SALE

The Jersey has proven the most economical producer of butterfat. Recent sales have demonstrated their popularity. When the Butler sale averaged \$3,367, a record for all breeds was established.

Now is the Time to Get Into Jerseys

My diversity of interests makes it advisable to dispose of my milking herd.

16 Cows and Heifers in milk.

7 fresh in August.

Mostly bred to UNDULATA PRINCE 109172.

5 Yearling Heifers, open.

6 Cows are on R.-of-M. test and making splendid records.

The daughters of Undulata Prince are making splendid records at the pail, and are outstanding in the showing. I am retaining this year's crop of calves by him for the foundation of my future herd. At Sacramento in 1917, his get won: 1st prize, get of sire; 1st prize, produce of dam; 1st prize, young herd; 1st prize, calf herd; 1st prize, junior and senior calves and junior and senior yearling in the heifer classes; also junior and reserve grand champion.

In 1918 a daughter was second in the milking contest at Sacramento. His daughters on test are making up to 43 lbs. fat with first calves on ordinary farm care.

This is an opportunity to get into the Jersey business right.

Fresno Poland-China Sale a Success

(Written for Pacific Rural Press.)

A decided success. That is what the first consignment sale of the Fresno County Poland-China Breeders' Association must be considered. It was held at Fresno August 20, with a large and representative crowd on hand. Many of the prominent breeders from neighboring counties were there to boost for the breed, and several participated in the bidding.

An excellent pork lunch at noon put the crowd in good humor, and then the sale opened with an interesting talk on Poland-Chinas by W. Bernstein of Hanford. Prof. L. B. Smith, Farm Advisor of Fresno County, also gave a talk on the benefit of purebred livestock.

The 51 sows and gilts averaged \$120.09. The offering of boars was negligible as to numbers, only two being put up. The top of the sale was the Big Knox Boy sow, Bonnie Mc., consigned by A. Buckland & Son and bought by E. E. Lapelle of Caruthers for \$335. She is a proven sow of great size and quality. Buckland & Son made the highest average, their 9 head averaging \$188.

The complete list of consignors and buyers is as follows:

- A. BUCKLAND & SON.**
1. Ruby's Big Bone, I. L. Mason, Fowler, \$240.
2. Bonnie Mc, E. E. Lapelle, Caruthers, \$335.
3. Peggie Big Bone, F. C. Morris, Benicia, \$165.
4. Leading Lady B, Mrs. Annie Donders, Fresno, \$155.
5. Leading Lady C, F. Bisel, Fresno, \$155.

45. Queen Anne, Mrs. F. W. Wright, Selma, \$145.
G. W. PFOST.
46. Riverdale Lady, A. Zurligen, Chowchilla, \$85.
VERN FULLERTON.
47. Miss Lucern, M. Bassett & Son, Hanford, \$145.
H. N. ASKOV.
48. Liberty Lady, W. A. Snelson, \$125.
49. Candy K. Quality 2nd, E. E. Lapelle, \$165.
One of the two boars was consigned by A. J. Van Cleef of Riverdale and purchased by H. Joseph of Livingston for \$55. The other was consigned by G. W. Pfost, Riverdale, and purchased by L. Schram of Clovis for \$27.50.
The drawing for a gilt proved of great interest. All those in attendance except the consignors were given free tickets, and at the close of the sale the drawing occurred. Mrs.

Thos. J. Woodward of Stratford was the lucky holder of the winning ticket, and to prove that the gilt had real worth, A. Buckland announced before the drawing that if the winner did not want to keep the gilt he would pay \$50 for it.

TULARE POLAND-CHINA SALE PROMISES BIG.

Fifty head of Poland-Chinas will be offered at the first semi-annual sale of the Tulare County Poland-China Breeders' Association, to be held in the Sales Pavilion at Tulare, October 21. There will be 42 bred sows and gilts, 4 open gilts and 4 boars, selected from 12 of the leading herds in the county. Those who are posted on the development of this breed in Tulare county know that such an announcement means a sale of quality stock, for some of the best herds in the state are now located in Tulare county. While the association is young, the men behind it are veteran breeders. They are breeding the type of Polands so popular today, and buyers in the market for animals that combine size and quality together with the best blood lines of the breed should not miss this sale.

GUERNSEYS FOR PROFIT

This breed combines usefulness with beauty, and has won over all other breeds in the net profit from butterfat production and the greatest returns for every dollar invested in feed. Also it is noted for the best flavored and highest natural colored products.

START WITH THE BEST

We believe that our herd cannot be surpassed anywhere in uniformity of type, health, breeding and production. Heretofore most of our cows have been held above price, but now, because of the rapid increase of our business along other lines, we are compelled to disperse this entire Guernsey herd.

100 HEAD AT PRIVATE SALE

Everything goes; not an animal reserved. There are 83 females of great production and promise; 17 males that are real herd headers. Twenty-one of the cows have Advanced Registry Official yearly records of from 500 to 800 pounds butterfat, and several more are now on test.

If you want show quality as well as heavy production, you will find them here. The herd includes the grand champion cow and the junior champion bull at the last San Francisco Show, and many young animals fit to win in the hottest competition. Will sell separately or in lots.

FEMALES OF GREAT PROMISE

While a good share of the mature females have been given records, they have not been forced, and there is not a cow in the herd that has shown her limit of production. Also many of the untested cows give promise of making even better records than the ones already tested.

BULLS FOR BREEDING UP

Guernsey bulls quickly build up grade herds. They are so prepotent that they stamp the breed characteristics upon their offspring to a marked degree, and soon you have profitable producers of quality products. We offer some royally bred young bulls that will quickly double the profits from your herd.

Your Opportunity—Act Quickly

You know how difficult it has been to secure good Guernsey stock, so don't put the matter off. If you want foundation stock for a registered herd, new blood for an established herd, exhibition stock for the fall shows, or a bull to breed up a grade herd, come at once and make your selection. If you can't call, send for a copy of our Sales List and describe your wants fully.

DON'T DELAY; DO IT TODAY. THE STOCK IS SELLING FAST.

Pooling Wool Pulls Bigger Profits

(Written for Pacific Rural Press.)

A subscriber who signs himself A. W. G. asks what wool is selling for at present, and wants our advice as to whether he should sell at the present price or hold his wool until later.

In the first place, the "present price" depends on how he markets his wool. We are handicapped out here by having only small buyers in this market, and if he sells to them he will get only about 35 or 40 cents. Last year there was talk of having central warehouses at which wool could be collected and graded, and through which it could be marketed. Undoubtedly such a step would mean a great deal to the sheep raisers of this section, but something must be done until such assembling points are established, and the pooling method seems to be the solution of the problem.

Co-operative marketing of wool is not an untried plan. It has been carried on most successfully in all parts of the United States at a minimum of expense and a maximum profit. Three counties of Idaho pooled 230,000 pounds of wool last season and sold it as one clip. The cost of handling the wool was only .003 per pound. That is, 1,000 pounds were handled for 3 cents. Could each grower have done it as cheaply? Not likely.

The farmers of Wayne County, N. Y., saved \$2,154 per carload, or an average of 11.3 cents per pound, by marketing their wool co-operatively through the Farm Bureau.

Here in this state the members of the Farm Bureau and Farmers' Union of Stanislaus county pooled a carload of wool and shipped it to Boston in July. It sold there for 60 cents, which will net the farmers over 50 cents. Some better than the 35 or 40 cents that local buyers offered.

If our subscriber, who says he has 1,000 pounds to sell, will get several of his neighbors to join him, they undoubtedly can make up a carload lot and ship east. They probably will be able to get at least 10 cents more per pound.

Whether they should ship at once or hold for a better price later on, is a hard question to answer. One authority advances the theory that the time to get the best price for anything is when your competitors who sell the same kind of goods are not selling, and he claims that the best time to sell wool is between July 1 and November 1, as the Government has agreed to withhold its stock of wool from the market during this period.

Business in the manufacture of woollen goods seems to be booming. Woollen goods seems to be booming. The record for 1919, the amount being 55,000,000 pounds, grease equivalent. Authorities say that this indicates continued activity in the textile industry, and the fact that Americans are heavy buyers at London wool auction sales shows that they anticipate a shortage at home. Normally we have a carry-over of about 300,000,000 pounds, but we understand that the surplus this year is estimated at only 190,000,000 pounds, so really, as compared with our usual surplus, there is a shortage at present. Also, the available stock of woollen fabrics are very low on the shelves of the trade. After every previous war the price of wool has increased and remained high for a considerable period. Why should we expect the reverse this time?

Perhaps the Government investigations of the High Cost of Living may lead to steps which will cause prices to tumble, but at present the farmer says he cannot lower his prices until the cost of labor, clothing, machinery and other purchased supplies comes down; the manufacturer declares his goods cannot be sold at lower rates until labor and raw material are on a lower basis; labor maintains that a lower wage scale is impossible until the cost of living decreases.

The existing high scale is the result of war stimulation that produced excessive demands on material and labor. But while destructive consumption has ceased, the large stores of raw material gathered during the years of plenty have been consumed, and it

looks as though it will be some time before the consumer will have the advantage in bargaining—before there will be any great drop in the price of wool.

At a meeting held in Columbus, Ohio, composed of representatives of wool growers' associations, other farmers' associations, state and federal institutions, wool dealers and manufacturers, a committee consisting of some of the leading authorities in the United States was appointed to investigate conditions and made the following report, which perhaps will answer the question of our subscriber better than we can:

"Statistics regarding the present world's stocks of wool, and their character, lead us to the belief that there is no cause for alarm regarding the future of the sheep and wool industry. Wool stocks at present in this country are characterized by large supplies of grade wools of a kind not normally coming into competition with the best grades of domestic wools, and with a comparatively small supply of choice wools.

"Furthermore, the prospective demand of manufacturers appears sufficient to absorb all supplies of good wool now in sight. There appears to be nothing in the situation to cause growers to be hasty in selling their wools.

"It is our understanding that any reforms to be brought about in wool marketing methods must be inaugurated and conducted by growers themselves for they will benefit first and chiefly from such reforms. It is strongly urged that wool growers form and support community organizations for marketing their wool and improving their production; and it is further urged that these community organizations federate as rapidly as possible with the state and national organizations. Loyal support of the local organizations is deemed essential to success."

MORE CALIFORNIA LIVESTOCK TO HAWAII.

The Hawaiian Islands certainly are proving a valuable field for the sale of California livestock. We have reported numerous shipments to that territory, and now we are glad to announce extensive purchases made by Harold W. Rice, who has a 35,000-acre ranch at Paia, Maui Island.

Mr. Rice, who is now in California, purchased from H. H. Gable of Diamond G Ranch, Esparto, 12 yearling and 3 aged Hereford bulls; from the University Farm 2 yearling Hereford bulls; from W. J. Bemmerly of Woodland, 35 Hereford cows and the outstanding young bull by New Era 2nd, out of a Bonnie Brae cow, that weighed 1150 pounds at 11 months. For the latter he paid \$2,500. Mr. Rice also secured 8 very fine weanling Shorthorn bulls from the Caledonia Ranch of Edward Cebrian at West Sacramento.

For Kemoo Farms, Schofield Baracks, he purchased a Duroc boar from the University Farm; a Duroc sow from Henry Cummings, Visalia; a Guernsey bull from the University Farm, out of a cow that recently made a record of 728 pounds fat in one year; 2,000 White Leghorn pullets from Hopland Stock Farm, Hopland.

This purchase means much to California, as heretofore Mr. Rice has been buying his beef cattle in Australia.

PATTERSON DISTRICT FAIR.

The enterprise of a few of the leading livestock and business men of this beautiful town of the West Side resulted in a cracking good exhibit of livestock, products of general agriculture, implements and tractors.

Prominent among the livestock exhibits were the Percheron and Belgian horses of wonderful class owned by N. W. Thompson.

Let the PAPEC CUTTER

SAVE MONEY FOR YOU

Fill your silo at the right time. Own a "Papec" and be sure of your winter feed.

Feed cut hay to your stock. It takes less space and stops waste.

Don't wait for your neighbor to fill his silo in order that you may use his ensilage cutter. Get a "Papec." When your silo is ready for filling you won't have to depend upon someone else. The "Papec" will enable you to preserve the full value of your crop by handling it at the right time. This saving will soon pay for your silo.

The "Papec" has a solid semi-steel frame. No screws or bolts to loosen. It requires less power and will handle more ensilage and "throw" it farther than any other. Note the illustration of the wheel. Six fans on cutting wheel do the trick.

The "Why of the Wheel"

An ensilage cutter with four or less fans requires an elevating pipe large enough to receive at least one-fourth of the ensilage cut at each revolution of the cutting wheel.

Thus the Papec, with its six fans and small pipe, "throws and blows" a steady stream of ensilage with a force more concentrated and with a pressure much greater than a cutter with four or less fans and a larger pipe.

The Papec Ensilage Cutter requires less power and elevates higher. The knives shear keen and clean.

See Our Display at California State Fair,
SACRAMENTO

The "Simplex" Silo has stood the test of time and has proved to its thousands of satisfied owners that it offers the surest means of increasing their profits.

The "Simplex" is substantially built throughout. Doors, frames and staves are of **Clear Oregon Pine**. No end joints. Staves and door jambs are in one piece, the height of silo. Hoops are of new steel with heavy malleable adjustment lugs. Doors are of the two way type, swing or lift.

Our interlocking anchor system makes the "Simplex" windproof. Cable braces run diagonally from top to anchor bolts imbedded in foundation. Not a weak place in entire construction.

The Crisell Tangent Top keeps the "Simplex" always in a true circular outline. This is a patented feature of the "Simplex" and one of the secrets of its success.

Increase your Pro fits

The "Simplex" Silo and the "Papec" Cutter are a combination that will yield big returns on the investment for many years. They are both guaranteed. Money back if they don't stand the test. Send the coupon for full particulars, prices, etc.

November 17-22—Pacific International Livestock Exposition, Portland.

THE DAIRY.

The American Jersey Cattle Club has appropriated \$2,500 for premiums to be given in boys' and girls' calf clubs for the year. \$75 of this sum will be presented to each of the first 33 clubs reporting to the secretary, after publication of this notice.

The State Dairy Bureau which is to be merged with the State Veterinarian's office under the direction of Dr. Iverson, will soon be moved from San Francisco to Sacramento.

Supervision of official testing of dairy cattle has been transferred from the College of Agriculture at Berkeley to the University Farm, Davis. This move will be welcomed by the many breeders of pure-bred cattle who keep in close touch with the Davis institution.

The California Dairy Council now has a membership of 1,200 according to Sam H. Greene, the genial secretary and manager. The campaign for membership has hardly begun in earnest and the ease with which members have already been secured shows that the movement is sweeping the state like a tidal wave.

BEEF CATTLE.

It is reported that W. R. Madden, the well-known Hereford breeder of Dixon, together with Will Timm, has bought a large stock ranch near Nogales, Arizona.

Wood & Shaw have purchased from A. K. Macomber, for \$80,000,

the Soap Lake Ranch in San Benito county, north of Pacificines. With it were included 140 head of grade Shorthorns which were purchased at \$120 per head. The new owners will establish a pure-bred herd.

The American Hereford Breeders' Association has decided to offer \$1 in premium for every dollar offered by the California International Livestock Show to be held in San Francisco, November 1-8. This duplicates the action of the Shorthorn people and makes a liberal inducement for breeders of these two prominent breeds to come out in full force.

It is reported that on account of the severe drought in Montana between 600,000 and 700,000 cattle will be shipped out of the state. Stockmen are being advised to dispose of their steers, old fat cows, yearlings and two-year-old steers and heifers when necessary, keeping at home only cows with calves.

Wm. Briggs has started a pure-bred Hereford ranch at Dixon, securing foundation stock from Nevada and Texas. His herd bull is of Anxiety breeding and was purchased from the Vele herd of Missouri. Rambouillet sheep also will be carried and a foundation flock of ewes has been established headed by a \$500 yearling buck from Idaho. The farm will be in charge of Jm. Briggs Jr.

Last week in mentioning the showing that the Pacheco Cattle Company of Hollister will make at the State Fair, we stated that they would have a fine showing of Holsteins, which, of course, should have been Shorthorns. Ordinarily this mistake would be a pretty bad one, but the Pacheco Shorthorns are so well known that had we used almost any word in the English language readers would have known what was meant. It will be remembered that last year this concern captured nine first and three second prizes.

When W. A. Cochel, field man of the American Shorthorn Association, made his recent trip to the coast he visited Caledonia Farms at West Sacramento and pronounced Mr. Cebrian's Shorthorn herd the largest in the country. The herd has a reputation for quality in keeping with its size, as it produced the grand champion steer over all breeds at the 1917 Chicago International; the dam of the grand champion Shorthorn steer at the 1918 International; the dam of California Model, the highest priced Shorthorn bull ever sold on the Pacific Coast, bringing \$5,500 at public sale.

SWINE AND SWINEMEN.

Lloyd & Tointon of Lloyton Farms, Santa Rosa, have added another convert to the list of Yorkshire breeders, and have sold a herd of 11 head to W. A. Straub of Sutter City.

In the advertisement of Les McCracken of Ripon appearing in last week's State Fair issue it was stated that his sire, Kings Big Bone Leader, was grand champion at the State Fair of 1917. This should have been 1918, as it was only last year that this boar made his great winnings.

The California Poland-China Breeders' Association will hold a business meeting at the Travelers Hotel, Sacramento, Wednesday, September 23, at 7:30 p. m. for the purpose of electing officers and transacting business of great importance to the breeders. All Poland-China breeders, whether members of the association or not, are urged by secretary A. D. McCarty to attend.

Donald Graham, the Duroc breeder of Lancaster, has just received two corking good eastern sows, one sired by the 1916 Nebraska grand champion and bred to Chief Sensation who weighs 1,060 pounds in breeding condition. The other sow is a line-bred Cherry Chief out of the Illinois grand champion sow of 1917, and is bred to a son of Great Wonder I Am the largest junior in Nebraska.

WHY

The ACME Cutter

Requires the Least Power and Produces the Finest Silage

Its light-running qualities are due to its triple steel frame construction. There's not another cylinder cutter like it. The steel frame can't warp or sag. All bearings are held in rigid alignment allowing free, smooth running. Loss of power due to vibration and unnecessary wear are thus reduced to the minimum in the Acme, and its durability increased. Vibration is further reduced by the 3-bearing cutter shaft.

Silage of exceptional quality is produced by its spiral cutting knives. Their perfect shearing stroke give a clean-cut uniform silage that is easy to pack properly in the silo.

Our Cutter Catalog Describes All Sizes
Shall we send you one?

Dimmick Bros.

LEMOORE, CAL.

C. G. DeRaad

LEMOORE, CAL.

COL. GEO. W. BELL, Auctioneer.

A report from Williams states that the Stovall-Wilcoxon Ranch of 36,000 acres has been sold at a price of approximately \$2,000,000. The holdings extend from the coast range foothills to the Sacramento River and include thousands of acres of remarkable fertility; also some fine range land. Among the new owners we notice the name of Judge Bridgford of San Francisco.

Floyd E. Hendricks of the Hendricks Angora Goat Ranch near Cottonwood, uses his 1,400 goats to help clean the land, besides getting an average clip of 5 pounds of mohair per goat per year.

Coming Sales in the Swine World

(Written for Pacific Rural Press.)

Great Interest in Bernstein-Haag Sale.

The announcement of the sale of Mabel's Jumbo back in the corn belt for the record price of \$18,000 is increasing the interest in the joint sale of John M. Bernstein and W. L. Haag & Son, to be held at Hanford, Wednesday, September 17, for the Haag boar, Young Jumbo, is a grandson of the sire of Mabel's Jumbo—the great Halford boar, Long Jumbo. Everyone knows how Long Jumbo blood breeds on, and there promises to be lively bidding on the sows and gilts sired by Young Jumbo or bred to him.

The Yankee blood, also is exceedingly popular back in the corn belt, and in one week three of this boar's young sons were sold for \$5,400. He has the reputation of never having sired a pig with a bad foot, a poor back or a wrinkle, and The Yankee Jr. is convincing proof of his ability as a sire. A large number of sows and gilts will be bred to The Yankee Jr., several of them having been imported from the Corn Belt, and they should sell like hot cakes.

It's going to be a great sale. The only way a fellow can lose is to stay away.

Poland-China Sale at Lodi.

Lodi is the hotbed of Poland-China in San Joaquin County, and several of the largest and most prominent breeders in the state are located there. These breeders, together with others in the country—all members of the San Joaquin County Poland-China Breeders' Association, will hold a sale of quality stock at Lodi, Friday, September 19. It was first planned to make it an exclusive boar sale, and 40 cracker jacks were consigned. Later 20 bred sows and gilts were added, making one of the strongest aggregations of hogs ever driven into a sales ring. A judging committee passed on all animals consigned and accepted only the choicest. Those selected are the tops from the various herds, and they represent the best blood lines of the breed. Don't miss this sale of quality stock. Col. Ord L. Leachman will be the auctioneer.

Trewhitt-Vaughan Poland-China Sale.

Those in the market for Poland-Chinas who are in no hurry to buy will do well to wait for the sale to be held at Hanford, October 18, by W. D. Trewhitt and C. A. Vaughan. These well-known breeders will offer 52 bred sows and gilts and a few boars. Mr. Trewhitt's consignment consists of 40 of the finest sows and gilts he has ever offered, and you know what that means, for he always has the best in both breeding and individuality. C. A. Vaughan will consign 12 bred gilts purchased on his recent trip to the Corn Belt. They combine size and quality and represent the last word in Corn Belt breeding. The sows and gilts are sired by some of the breed's most noted boars, and bred to boars of the same caliber. You can't go wrong in buying them.

Another Kings County Poland-China Sale.

"The real Poland-China center of the Pacific Coast" is the claim that the Kings County Poland-China breeders make for their section, and they are going to hold a consignment sale at Hanford, Oct. 11 to prove that to get the best you must come to Kings County. It will be the eighth semi-annual sale of the association. Eighty bred sows and gilts and a few boars will be sold without reserve. The tops of 21 of the leading herds in the county have been consigned. They include tried sows of proven worth, gilts of great promise and boars that will make great herd leaders. If you have ever attended one of these sales, you will want to go again. If not, be sure to take in this one. You will make money on any animal you buy. Castlevue Ranch to Hold Berkshire Sale.

The fact that J. Francis O'Connor of Castlevue Ranch, Santa Rosa, has already claimed the date February 14,

1920 for a sale of bred sows and gilts shows that he is going to take plenty of time to get his sales stock in fine shape. He certainly has a lot of good ones to work on, for the foundation Berkshires in this herd include the grand champion sow of the world, the grand champion sow of America, and the grand champion sow of California. The herd sire is Mayfield Rookwood 2nd, a grand champion boar and sire of the grand champion barrow at the 1919 Berkshire Congress.

Mr. O'Connor will sell 50 bred sows and gilts, and as a special attraction the grand champion sow of America, Rookwood Lady 100th, will be offered, probably bred to Star Leader. Breeders who want Berkshires of the ribbon pulling kind will wait for this great event. Col. Ord L. Leachman of Sacramento will cry the sale.

Dimmick-DeRaad Dispersal Sale.

A dispersal sale by a prominent breeder offers a wonderful opportunity to secure foundation animals that ordinarily could not be purchased. Consequently, when two herds are dispersed together a doubly good opportunity is afforded. Dimmick Brothers of Lemoore are dissolving partnership and C. G. De Raad has sold his farm. These well-known breeders will disperse their herds together at a public sale to be held at Hanford, September 30, and about 90 head will be offered, including bred sows, bred and open gilts, herd boars and spring and summer pigs. No matter what you are looking for, you will find it in this offering. The beginner can secure a foundation herd; the established breeder can secure new blood; the market hog man can get a boar that will increase the profits from his herd. The hogs that have made these breeders famous will do as much for their new owners. Get some of them.

Bassett-Crawshaw-Ross Sale.

What's in a name? Perhaps there isn't much in some names but when you see the names of such veteran breeders as Mark Bassett, Dr. J. A. Crawshaw and Fred D. Ross, you immediately think of the very best in Poland-Chinas. These men have been in the business for years, have been prominent winners at the shows, and have sold stock all over the state that has made good. They now join and will offer 75 head of bred sows and gilts and herd boars at public sale at Hanford, October 7. They announce the greatest assemblage of the best blood produced in Poland-China, and you can depend upon them to make good. Every animal will be doubly treated. Wait for this sale, and plan to buy some of these fine hogs. Col. Ord L. Leachman of Sacramento will be in the box.

Marsh and McCracken Join for Poland Sale.

It is necessary to talk in the superlative degree when describing the Poland-China herds of Hale I. Marsh of Modesto and Les McCracken of Ripon. Mr. Marsh has been a consistent winner at the shows for years and it will be remembered that at the last State Fair he showed a herd weighing 3200 lbs. (one sow weighing 900 lbs.) and afterwards sold the herd for \$4,000. Mr. McCracken came into the limelight when he bought Kings Big Bone Leader, grand champion of 1918, at the highest price ever paid in a California sales ring. This boar's pigs are in great demand and the sows and gilts which Mr. McCracken will offer will be bred to him. The sale will be held at Modesto October 4, and a wonderful lot of bred sows and gilts from these noted herds will be offered. Great chance to get championship blood.

Milk that has an unpleasant flavor often acquires it after it has been drawn from the cow. This bad flavor is more often due to other causes than to the feed the cows have had.

Lice prevent a hog from doing well; therefore prevent the lice from associating with the pig

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

W. H. YOUNG COMPANY

58 SUTTER STREET,

SAN FRANCISCO

FIRST PUBLIC POLAND CHINA SALE

Hogs in this offering are animals of the choicest breeding along very fashionable lines of the big-type. They have all been passed on by a judging committee of very conservative breeders so that the sale will include nothing but tops from the various herds.

20 Bred Sows and Gilts 40 Boars

The boars and gilts offered are either sired by or bred to some of the most noted boars of the Poland-China breed on the Pacific Coast, such as Major Hadley Wonder, Matchless Big Bob, Big-Bone Bob, olden State ing, Ursus Junior, and others of equal note.

The Consignors are as follows:

BECKMAN & SONS
JOHN HAGEL,

EUGENE MINER,
J. E. STEELY,

N. K. HORAN,
LANGHORST BROS.,

J. W. WAKEFIELD,
J. F. LEHMAN,
YOUNG & BARTON,
YOUNG & CLARK.

—at—

Lodi, Friday September 19th

Do not miss this sale if you are in the market for either a boar as a herd header of registered sows, or for service in a market herd. The offerings will improve registered herds and are of such constitution and prepotency that they will give uniformity and the well-known easy-feeding qualities to your grade herds.

Come early and make your choice before the sale starts. Those not attending may send mail bids to Thos. F. McConnell, Field Man for the Pacific Rural Press, in care of the Secretary.

SAN JOAQUIN COUNTY POLAND-CHINA BREEDERS' ASSN.

Lunch at noon.

Sale starts promptly at 1 o'clock.

**BERKSHIRES SALE AT CARRUTH-
ERS FARMS.**

Live Oak Champion, a great example of true Berkshire type, was the top at this sale, selling for \$425 to the Imperial Stock Farm, R. J. Merrill & Son Props., Morgan Hill. This boar is a very smooth fellow of good bone and ought to mix well with Mr. Merrill's sows. The sale was satisfactory, with an average of practically \$81 including all animals sold from the top boar to the smallest weanling pig.

Many of the prominent Berkshire breeders and boosters of the State were present, including J. Francis O'Connor, James Mills, W. S. Guilford, J. L. Thatcher and others.

HAUSER'S DIGESTER TANKAGE

Gives Great VALUE for LEAST MONEY. IT MAKES THEM FAT.

HAUSER PACKING CO.**LOS ANGELES****ATTEND THIS GREAT SALE**

If you want to see the crowning achievement in big-type Poland-China breeding, be sure to attend this joint sale of John M. Bernstein and W. L. Haag & Son, where size will be the fashion and quality will reign supreme. These constructive breeders will sell bred sows and gilts that will eclipse anything they have ever before offered. The animals have been selected from the leading herds of the East and West, and combine in their pedigrees the richest blood of the breed. You will like them. They are the kind you need to insure your success.

40 Poland-China Bred Sows and Gilts 40**THE YANKEE, JR.**

This phenomenal young boar is by THE YANKEE, probably the most famous sire of the breed for his age. He is big without being "loggy," and long without being low-backed. It will add prestige to your herd to have a litter sired by him.

**Royal
Breeding**

The sows and gilts are sired by President, Young Jumbo, King's Big-Bone Leader, Giant Jones, Frazier's Timm 2nd, K's Big Price 2nd, Mouw's Black Wonder and Miller's Long Chief. They are bred to two of the coast's greatest sires, President and Young Jumbo; also to the two sensational young boars, The Yankee, Jr., and Lendorris Liberty Bond.

LENDORRIS LIBERTY BOND

This young epoch-maker is by the great LIBERTY BOND, for whom \$10,000 was refused. He has great size, combined with extreme quality, and is just the type that progressive breeders like. He is bound to be a sire of ribbon pullers.

**Hanford Fair Grounds,****Wednesday, September 17th**

Lunch at 11:30.

Sale starts at 12:30 sharp.

Come, if possible, but if not, send mail bids to either consignor or the auctioneer. Don't fail to get a few of these good ones. You will never regret it. Everything doubly insured.

JOHN M. BERNSTEIN and W. L. HAAG & SON**H. M. BERNSTEIN, Auctioneer.****HANFORD, CAL.**

Poultry and Rabbits for Profit

HENS WITH OFFICIAL RECORDS IN DEMAND.

(By Prof. E. F. Palmer, American Poultry School, Leavenworth, Kan.)

\$6.15 profit per hen above all feeding costs was actually made by 75 pullets during the last nine months. Certainly this proved that standard-bred poultry, properly bred and selected for egg production, properly housed and cared for, and, more important still, fed on a perfectly proportioned egg-making ration, will more than make any man or woman a fine profit and perhaps a larger cash return on the amount invested than would be possible in any other business venture.

Fifteen pens consisting of a total of seventy-five standard-bred pullets, owned by different breeders throughout the United States and Canada, are being given the very best of care, feed and housing at the contest conducted by the American Poultry School. They are being fed scratch grain consisting of choice sifted cracked corn and whole wheat. This is scattered in medium deep litter in the early morning and one hour before roosting time in the evening. A dry mash consisting of wheat bran, shorts, hulled oats, corn meal, bone meal, beef scrap, charcoal and fine salt is always kept before them in hoppers. At ten A. M. and again at two P. M. a moistened mash is given. Care is always taken to feed no more than what the hens will clean up in twenty minutes. Every other day this mash is made moist by the use of fresh beef bone soup, which is first properly diluted with water.

It is unnecessary to use these exact grains. One should be guided largely by the available supply and its price. The important thing is that a hundred pounds of one kind of grain will make more yolks and less whites, as compared with another grain which makes more whites and less yolks. To get full value in fowl condition and egg production we must consider these things. Regardless of what kind of food stuff we use, it must be proportioned so that it represents a possible equal number of yolks and whites.

Between November 1, 1919 and August 1, 1919, these 75 pullets consumed an average of 11 pounds of food per month for each female, about half mash and half scratch grain. One square inch of green sprouted oats was supplied each pullet per day. Hard grit and oyster shell was always kept before them.

These 75 pullets produced 13,144 marketable eggs which sold at an average of 58 cents per dozen or a total of \$635.29. The feed, purchased of a local dealer, cost \$173.47, leaving a profit for the nine months above feed cost of \$461.83, or a profit of \$6.15 per hen.

This production, which is slightly over an average of 65 per cent per day, is the more remarkable in view of the fact that it takes in the months from November to July. At least three of these months provided much extremely cold and stormy weather, while two months provided some very intense heat and much dry weather.

There is a great deal of interest being taken in the pullets in this year's contest. Seldom a day passes

that we do not receive mail inquiring as to the ownership of certain high producers and asking if they can be purchased. Already several of these females have been sold for delivery after the close of the contest at prices ranging from \$25 to \$100 per fowl. We have reason to believe that some fine producers are likely to change owners at prices even higher. The demand for fowls with official egg records or actually bred from such is greater today than ever before.

USE GRASSHOPPERS FOR CHICKEN FEED.

Grasshoppers make good poultry food, and wherever the insects abound they may be utilized for egg and meat production by either capturing them and feeding them to the flock or by liberating the flock on the range so that the hens may catch the grasshoppers.

A grasshopper catcher, 16 feet long with an upright piece of curved tin at the front so arranged that the insects will hit against it as they hop about, thus causing them to fall to the bottom of the trap and backward through a narrow opening into a box at the rear of the machine, may be useful on fields where the grasshoppers are abundant.

The tin front does not extend quite to the bottom of the trap, where, just in front of the tin shield, is another strip of tin placed so that there is an opening about 1/2 or 2 inches wide. This front strip or lip may be made by using a 16-foot length of gutter, one side of which is flattened outward. The back and top of the box in the rear is covered with wire screen, while the top should be hinged in such a manner that it can be easily opened and the accumulated grasshoppers removed as desired.

A horse is hitched to the extended beam at each end so that the catcher may be dragged over the infested field, beginning at the sides and working toward the center of the area. Ordinarily a boy riding on each horse can easily operate the machine. A heavy rope attached to the hames so that it drags a few feet in front of the shield is advantageous in that it stirs up the insects just before the catcher passes.

The grasshoppers can be dumped into sacks and hung up to dry, subsequently being fed as dry grasshoppers, or, if the poultryman desires, he may feed the grasshoppers alive, the grasshopper trap being hauled into the poultry yard and placed so that the front end faces the light. The insects will make their way out of the cage just about as fast as the ordinary flock of chickens can eat them. By such management the grasshopper catcher is transformed into a poultry self-feeder.

Straw, as a nesting material, is not especially good, as the hollow straws provide breeding places for mites. Tobacco stems make a good nest, as lice and mites cannot endure the odor. The stems should be covered with hay or shavings.

Soft-shelled eggs are often caused by the fowls being confined, becoming overfat, and from a lack of mineral matter.

Caponizing makes cockerels so much quieter that they use their food for growth and fat and make greater weights. A lot of capons have been known to gain 50 per cent more than cockerels of the same age.

Keep brown-shelled and white-shelled eggs separate when sending to market.

Plenty of room for hens means more eggs in the nests. Don't crowd your poultry.

Poultry Breeders' Directory

BOOKING FOR WINTER, SPRING DELIVERY

Most Fall Chicks Already Booked. yet hundreds open most weeks, reduced, in each of seven popular breeds. Clearing customers, \$5 yearly. 200-290 egg strain. Large vigorous winter layers. HER AIRPLANE SERMON.

Grandmother there, hears the engines
of air—

Sees the airplanes sailing by;
Sailing by, and out of sight.
Under and ever the rainbows bright,
Higher than home-birds fly!
Sailing on, through the dark and
dawn,
And then like the light o' the rainbow
—gone!

"It's the miracle-time
That I've lived to see—
Man, like the wild birds,
Flying free—
God's good to you and me!"

Over the city the birdman's wing
Hover, and dart, and seem
Like shadows—they say—
Now of gold, then of gray.
Shadows you'd see in a dream.
And they fly to the east, and they speed
to the west,
And the storm drives them home, like

birds to the nest!
"It's the miracle-time,
Where the great wonders be,
But God's love is greatest,
And that's all we see—
God's good to you and me!"

—Frank L. Stanton, in Atlanta Con-
stitution.

A PAPER DOLL'S HOUSE.

Helen had no brothers or sisters
to play with her, so sometimes she
had a hard time amusing herself. She
had lots of dolls and dishes and doll
furniture; but one gets tired after
awhile of dressing dolls, and the
grandest tea-party loses most of its
charm when there's no one but dolls
to share it. She even tried inviting
Fido, but his table manners were bad.
Puss's were not much better, either,
so they were not invited a second
time. But Helen had the jolliest,
pleasantest mamma imaginable, and
she was a fine playfellow when she
had time. She was always thinking
up new games for Helen, and different
ways to make pretty toys.

One day she brought in a blank-
book about fifteen inches long and ten
inches wide. It opened endwise, like
a postcard album.

"What do you guess this is going
to be?" she asked Helen, her eyes
sparkling with enthusiasm.

Helen shook her head.

"A house for your paper dolls!"

Helen could not see how a book
could become a house, but, if mamma
said so, it was all right. She could
do anything.

Mamma opened the book at the first
blank page.

"This is to be the hall, so let's hunt
some furniture for it." So they got
out some old furniture catalogues,
magazines, and papers, and began to
look for suitable pieces of furniture.

"Shall we have it in mission, or wal-
nut, or oak? You like this heavy oak
set? All right: we'll just cut out this
hat-rack and paste it over here on the
page. Then this settee and two
straight chairs. Now for a rug and
some pictures."

By this time Helen understood all
about this interesting sort of house,
so she begged to finish its furnishing
all by herself. When she wanted a
door or a window, she drew them on
the page, and then pasted up her
draperies and curtains. What a de-
lightful task it was to furnish the
parlor or drawing-room, and the bed-
rooms—one for each doll—were a joy
for many days. It took a long time
also to furnish the dining room, and
to find dishes, silver, and glass to
suit her taste. The kitchen was most
interesting, and you may be sure it
was fitted up with everything that the
most fastidious paper-doll cooks could
wish for.

"Now, isn't this a nice house," said
her mamma, "for your large family
of paper dollies that have been knock-
ing about with nowhere to lay their
heads, so to speak? Of course, all you
have to do when the rooms are ready
is to put each doll in his or her room
and close—the book!"—Child's Gem.

PHILOSOPHY.

For indeed the fact is, that there are
idle poor and idle rich; and there are
busy poor and busy rich. Many a
beggar is as lazy as if he had ten
thousand a year; and many a man of
large fortune is busier than his errand
boy, and would never think of stop-
ping in the street to play marbles.
There is a working class—strong and
happy—among both rich and poor;
there is an idle class—weak, wicked
and miserable—among both rich and
poor. And the worst of the misunder-
standings arising between the two or-
ders come of the unlucky fact that
the wise of one class habitually con-
template the foolish of the other. If
the busy rich people watched and re-
buked the idle rich people, all would
be right; and if the busy poor watched
and rebuked the idle poor all would
be right. But each class has a ten-
dency to look for the faults of the
other.—Ruskin.

FASHION NOTES.

Novelty wool scarfs in beautiful
colorings, to be worn with a tiny
leather belt, are among the fall nov-
elties.

Satin seems the favored material
for the new afternoon gowns. But-
ton-trimmed and braided, it makes
very smart church or street dresses.

Tuxedo style sweaters and jersey
coats are much in evidence, both in
the shops and on the streets.

One of the new things in furs for
young people are the chokers—just a
broad band encircling the neck with
a bow at the back.

Jersey tubing, forty inches wide, for
the making of skirts without seams,
is shown in the stores.

Leather coats of tan, made revers-
ible, belted and with modish collars,
are one of the novelties of the season.

Accordeon pleated skirts in either
plain navy or plaid materials are new.

Knit cloth suits in heather mixture
are shown for fall and winter wear.

Bags of leather and fabrics and the
ever increasingly desirable beaded
bag are shown in dozens of novel de-
signs.

REFRESHING DRINKS.

All fruit drinks are much better if
made with syrup instead of sugar. To
make this syrup, boil two cups of
sugar and a pint of water for ten
minutes; when cool, put in a jar or
bottle for future use.

To the juice of three lemons and a
can of grated pineapple add this
amount of syrup and a quart of cold
water for a simple drink.

To a plain lemonade, a few drops
of essence of peppermint may be
added, or a bit of green vegetable col-
oring with a sprig of mint.

Any dried fruit or fruit juice may
be added that tempts the appetite and
you have a fruit punch instead of a
lemonade.

Iced tea should be served very cold
with plenty of sugar, slices of lemon
or orange, and a little mint.

Iced coffee should be diluted while
hot with milk and sugared to taste,
then have cream added just before
serving. A dash of whipped cream
adds to the flavor and attractiveness.

Iced chocolate is served in a novel
way if chunks of ice are put in a tall
glass and thick, hot chocolate poured
over them. The ice dilutes as well as
chills the drink. Whipped cream, a
drop of vanilla, and a sprinkle of nut-
meg flavor this beverage.

The popular milk shake can be
made at home by beating with a Dover
egg-beater two teaspoonsful of thick
chocolate syrup for each glass de-
sired, with milk and a small amount
of ice cream. When this is served
with a straw in a tall glass the chil-
dren will call it a "really party."

ORDERS ARE ORDERS.

"Now, then, line up alphabetically
for pay!" said the sergeant. "What's
your name, my lad?"

"Phillips, sir."

"Well, what yer doing up here? Get
back with the F's at once!"—Minne-
apolis.

CANNING COMPOUNDS.

Housewives should not use canning
compounds that are sold under vari-
ous trade names for use in home can-
ning of fruits and vegetables, because
many such compounds are harmful to
health. This warning is sent out by
the California State Board of Health,
under advice from the Bureau of
Chemistry of the U. S. Bureau of
Agriculture.

These preparations contain salicylic
acid or boric acid in powdered form,
the use of which is unnecessary, if
proper methods of canning are used.
Furthermore, the Federal Food and

Drugs Act prohibits the use of harm-
ful preservatives in food, and house-
wives must help to maintain the
health of the Nation, by refraining
from the use of these compounds.

OOZING JELLY.

If the liquid of the jelly oozes out
from under the paraffin, it is not wise
to neglect it, for there is danger of
mold forming. Remove the paraffin
and wipe the top of the jelly with a
clean cloth, being sure that the edges
of the glass are clean and dry. Then
put on fresh paraffin. All paraffin
tops should be put into a tin can to
be reheated for future use.

DREADNAUGHT
BLAZING AWAY IN COST-DEFENCE!

The Chap from Missouri

Nothing is "Good Enough" for the man from Missouri. Once
convince him that there is something better and he adopts it.
Everyone thought wood and coal was good enough until city
gas came into use. Now you couldn't get them to go back to it.
If city gas were piped into your cook stove, the result would
not be satisfactory because the heat is not there. So to offer
the convenience of city gas and apply it to the wood stove, a
better and hotter gas had to be produced. As that was possible
only with coal oil, or common kerosene, it was necessary to
devise a means of maturing, or drying this gas so that it would be a reli-
able product, day in and year out—for wet gas from kerosene is a trouble-
maker and expensive. Knowing this and the failures of the past, we set
about Dreadnaught construction in a scientifically correct manner, by
providing an easy, but natural means, of perfecting a dry gas. This was
accomplished by the simple, but very effective little square block, or drying
dome and a straight "lift" to the gas. It's an honest little burner and
made **RIGHT** in Los Angeles. Operates on gravity. Can be installed in
any stove without aid of plumber. Will be glad to mail your circular. If
you can suggest a good agent for your county would appreciate it. We
sell Burners, not "rights."

“IF.”

“If you can talk with crowds and keep your virtue,
Or walk with kings nor lose the common touch,
If neither foe nor loving friend can hurt you,
Yet all men count with you but none too much,
If you can fill the unforgiving minute
With sixty seconds’ worth of distance run,
Yours is the earth and everything that’s in it, and which is more,
You will be a man my son.”
—Kipling.

THE HUMBLE CARROT.

Carrots diced, cooked until tender, and served with a common sauce are not to be despised, but for those who like their carrots disguised, or at least toned down in flavor, the combination of diced carrots and peas is very acceptable. The color contrast is pretty and when peas are scarce, the contents of the dish may be materially increased.

Carrots, cooked and finely diced, or put through the meat grinder, when mixed with mayonnaise and served on lettuce leaves make an economical salad.

But the crowning achievement of all for carrots is their use in jam. Cook until nearly done enough for the table, drain well and then put through the meat grinder. To two cups of that ground mixture, add one cup of fruit, either raspberries, blackberries, or strawberries. Put on to cook with sugar as for any jam and when ready to seal the carrots have become an integral part of the fruit with which they were combined and have entirely lost any individual flavor.

DYSENTERY PREVALENT.

The California State Board of Health reports that outbreaks of dysentery have occurred frequently during the past few months at many places on the Pacific Coast. Several of these outbreaks have occurred in groups of children and unless brought under control promptly, it may be a great factor in increasing the infant mortality rate. It is important that all cases of dysentery be brought under control immediately in order that the precious lives of little children be saved.

Tramp—Kind lady, would ye please give a poor man a bite to eat?
The Lady—What! You here again? I will call my husband immediately.
Tramp—Excuse me, lady, but I ain’t no cannibal. I bid ye good-day.—
Boston Transcript.

Do you know the fineness of real tea-flavor or only the tang of coarse tea and tannin?

Common tea is the coarse tannin-flavored tea. It costs less per pound than Schilling Tea but more per cup.

Why not have good tea while you are about it?

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

FOOD PRODUCED BY FARM ANIMALS.

Which farm animal do you think produces the most human food for the food consumed? The following table gives the number of pounds of edible solids produced from 100 pounds of digestible matter consumed:

Cow (milk)	18.0 pounds.
Hog (dressed)	15.6 pounds.
Calf (dressed)	8.1 pounds.
Poultry (eggs)	5.1 pounds.
Poultry (dressed)	4.2 pounds.
Lamb (dressed)	3.2 pounds.
Steer (dressed)	2.8 pounds.
Sheep (dressed)	2.6 pounds.

But don't be deceived by this table. It does not necessary follow that the animal which produces the greatest number of pounds is the most profitable.

In the first place, the comparative values of the animals must be taken with consideration. For instance, one cow costs as much as eight or ten sheep, so the investment is greater and greater proportionate returns must be expected.

In the second place, some animals such as cows and hogs, require more care than others, such as steers and sheep, so the labor required is more costly.

In the third place, the kind and value of the feed consumed must be taken into consideration. If sheep can be maintained largely on weeds and waste, and dairy cows require high-priced feeds, the sheep will produce their human food at a much lower cost per pound than cows will.

So see what kind of feed you have, how much labor you can depend upon, and how much money you have to invest. Then you'll know how to stock your farm properly.

RED HANDED.

At a summer camp, one morning in late August, a man approached his pretty daughter and said:
“What time did you send that young Simpson home last night?”
“I don't think it was very late.”
“It must have been close to midnight.”
“Midnight!”
“Didn't you send him out of the back door and hustle off to bed when you heard me coming in?”
“Why, I must have been in bed for hours before you came in.”
“You heard me come in?”
“Yes. I guess you woke me up. I heard what you said, too.”
“Is that so? You say you had been in bed for hours?”
“Uh huh!”
“That's funny. I wonder how that chimney could be hot enough to burn my hands like this.”

THE SECOND EXODUS.

The tourist had lost an Airedale pup which he prized very highly. He rushed into the office of the town paper and wrote out an ad offering ten dollars reward for the return of the pup.

He returned in a few moments to add the words: “No questions asked.”

The only person in sight was a very sulky small boy.

“Where's the staff?” asked the tourist, glancing around the deserted room.

“Out looking for your dog,” replied the boy, sourly.

WINTER FLOWERING SWEET PEAS.

Now is the time to make the first sowing of sweet-pea seeds for winter blooms. Seeds sown now should blossom by November, continuing on during the months when cut flowers are exceedingly scarce. Buy only good varieties, for they are much more beautiful in color as well as longer of stems.

“Johnny,” said his mother, “if you don't quit smoking cigarettes you won't grow a bit.”
“Don't care if I don't,” responded Johnny, sullenly.
“And, of course,” continued the good woman, “if you don't get any bigger you will still have to wear clothes made from your father's old ones.”
“I guess I'll quit, ma.”

What Do You Know About Pianos

Assuming that you can “tell a good tone,” can you judge the hundred and one things which enter into the making of a Piano, the things which have their part in making and maintaining a good tone? Do you know the differences in plate and scale design? Are you familiar with the various actions? Are you a judge of the wood, the wire, the felt, the veneers and all the other materials which enter into the making of a Piano?

Probably not—not one person in a thousand possesses this expert knowledge. After all, when buying a Piano you depend greatly upon the expertness and the integrity of the Dealer or House. Let your greatest care be the selection of the Piano House. Tell that House what you would like and what you can afford and they will guide your selection of a Piano with expert judgment and a sincere desire to serve you well. Beware of a “cheap piano”—in the end it is the most expensive. Avoid the alluring statements of some dealers—they are but pitfalls to catch the unwary. Protect yourself by going to a Piano House with a reputation for integrity and fair dealing—you will never regret it.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianolas and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

The PREMIER BURNER

It's the Test That Tells

The Premier has a wonderful record, extending over four years. This winter, as was the case for the past three years, there will be a fuel shortage and the Administration asks that you conserve fuel. There can never be a shortage of Kerosene (coal oil), this being a by-product.

You do not have to chop it up. And it does not make ash es. This winter, make up your mind to enjoy the comfort you envied last year in your neighbor.

Market Comment

Sacramento Hops \$50 Per Bale.

The entire Sacramento Valley crop of hops has been sold in advance, averaging \$50 per bale. The crop is estimated at 43,000 bales.

Farmers' Products Gain in Price.

Prices paid to farmers as shown by the report of the Bureau of Crop Estimates were 17.1 per cent more for their products during July this year than for the corresponding month in 1918.

Rice Growers Getting 6c.

Paddy rice has advanced to \$6 a cental. Millers are offering \$5.50 to \$6 as against \$5.25 to \$5.50 a week ago. Spot prices hold about steady at \$11.85 for choice and \$12.25 for fancy domestic. Futures are at \$11.25 for fancy and \$11 for choice.

Almond Crop Opens at 35c.

Sales of this year's crop of almonds opened last week with 35 cents a pound for Nonpareils and Texas Proflics. The first shipments were made from Ripon orchards. The almond crop in the Sacramento valley is being sent to the packers.

Corporation Domination Charged.

The Fruit Growers of California, a co-operative concern formed to market green fruits, forwarded a complaint to the Federal Trade Commission last week charging the California Co-operative Canneries and the Santa Clara Valley Growers' Association with being dominated and controlled by Armour & Co. They charge unfair advertising, suppressed competition and non-co-operation within the meaning of the Federal Trade Act.

Fruit Loss \$1,000,000 a Day.

A telegram to trainmen in the East in behalf of the fruit crop of California was sent by most of the co-operative associations, canners, shippers, market men, and by the State Market Director last Wednesday, urging special exception in the Railroad strike in the movement of fresh fruit, tin plate, tin cans, fuel oil, sugar and other supplies for canneries. The closing down of canneries and spoilage of fruit is estimated as a loss of over a million dollars a day, and shortage of fruit for American consumption.

Walnuts Prices in the Air.

A statement of the present walnut situation from the association headquarters says that while the majority of the trade does not expect a price of over 30c a pound for No. 1 soft-shell they have been prepared not to lay too much stress on their judgment and as to uncertainty say: "No man living is capable of making an accurate prediction of opening prices at this early date. Ideas often change from 3c to 4c a pound within the week preceding announcement of opening prices."

Price Fixing Unfair.

Governmental regulations of prices in food commodities is onerous and unfair, declared by Frank D. Stringham, Acting Food Commissioner for California. Stringham said: "The abnormal prices now prevailing will continue at least another year. The only way to reduce prices and consequently the high cost of living is to increase production and decrease the demand. Any combination of men, whether it be an organization of farmers, of laborers, or of financiers, that uses its power to create an artificial and inflated price in these times is guilty of a crime and should be punished accordingly."

Fruit & Vegetables at Eastern Points.

California Malaga Grapes, 4's, were reported dull and weaker this week at Eastern markets, auctions sales ranging generally from \$2 to \$3, with top of \$3.75 in Philadelphia. Shipments increased moderately to 867 cars. Sweet potato movement increased sharply to 343 cars, compared with 149 last week and 142 for the corresponding week a year ago. Tomato shipments have been very light in recent week, 113 cars moving this week compared with 582 the corresponding week a year ago. Owing to the railroad tie-up, shipments will probably be discontinued for some time.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, August 19, 1919...

WHEAT.

The supply of wheat seems ample for all demands in San Francisco, although it is stated that arrivals are slow. All grain markets are dull.

Per bushel—

No. 1 hard	\$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 3	2.09
Early Baart	Nominal
California, per cbl	\$3.65 @ 3.70

BARLEY.

Barley was weaker this week both for spot and futures. Feed sold from \$3.00 to \$3.05, but the price of shipping, of which there is not a great deal left, was unchanged. On futures, December sold for \$3.07½ and May at \$3.17.

Feed	\$3.00 @ 3.05
Shipping	\$3.20 @ 3.30

OATS.

Oats were weak in sympathy with the barley market, and the general lack of demand. Quotations, however, are nominally unchanged.

Red feed, per cbl	\$3.00 @ 3.25
Red for seed	Nominal
Black for seed	Nominal
Re-cleaned Red or Black for seed	Nominal

CORN.

While the demand for corn is small compared with the other grains, it was the leader last week locally. A few small sales are reported at last week's quotations.

California	\$3.80 @ 3.90
Egyptian, choice	Nominal
Milo	Nominal

HAY.

Receipts of hay for the week were 2971 compared with 2818 of the previous week. The receipts by rail were much larger and about equalled the arrivals by water. With the railroad strike these growing receipts will undoubtedly be greatly cut during the present week. The market was fairly well-maintained and at times strictly fancy hay sold above the market quotations. The demand for stock hay that is free from foxtail is quite active at prevailing prices, but as most of this type of hay is heavily charged with foxtail, sales of this quality are difficult to negotiate. Alfalfa is doing well under heavy receipts.

No. - Wheat, or Wheat & Oat	\$15.00 @ 18.00
No. 2 Wheat, or Wheat & Oat	\$12.00 @ 15.00
Choice Tame Hay	\$16.00 @ 18.00
Wild Oat Hay	\$10.00 @ 14.00
Barley Hay	\$12.00 @ 16.00
Alfalfa Hay	\$17.00 @ 22.00
Stock Hay	\$ 9.00 @ 12.00
No. 1 Barley Straw, per bale	.50 @ .80

FEEDSTUFFS.

The market for feedstuffs is dull with lower prices on rolled barley and rolled oats, both of which are quoted a dollar under last week. The market is so dull that it is reported that some of the feedstuff makers are going into handling seed as a side line.

Roller Barley	\$65.00 @ 66.00
Roller Oats	\$63.00 @ 64.00
Cocoon Meal	\$48.00
Cracked Corn	\$79.00 @ 81.00
Alfalfa Products	\$36.00 @ 37.00

POTATOES, ONIONS, ETC.

The breaking out of the railroad strike in this section of the State has paralyzed the wholesale and commission district. The potato and onion market was not strong before, and just what effect the strike will have is causing a considerable worry. Stocks in this city are considerable and there is no present difficulty in shipping more by river. But with no outlet the local dealers believe there will be a slump if shipments are piled up in this city. So far no changes are made in quotations, but decided changes may be looked for if the strike continues. Arrivals of tomatoes during the past week broke the market to such an extent that the best Bay tomatoes were sold with difficulty for 75 cents for a large box. Until the price recovers it is not expected that more will be sent to this market. River tomatoes also dropped to half of last week's quotations. Green corn was also in excess of the demand and sold much lower than last week. Sweet potatoes were slightly weaker.

String Beans	2½ @ 4c.
Peas	5 @ 7c
Carrots, per sack	\$1.25 @ 1.50
Rhubarb, Strawberry, box	\$1.25 @ 1.75
Cucumbers	.50 @ 70c
Eggplant, box	.50 @ 60c
Lettuce, per crate	.75c @ 1.25
Celery, crate, Oregon	None

BEANS.

No relief for the holders of the 1918 bean crop has yet appeared, and the entire market is weaker with lower quotations on Mexican reds and large whites. Notwithstanding the publicity given to the fact that beans are one

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, August 26, 1919.

The unprecedented demand for Bartlett pears, even under extremely heavy offerings of California and Northwestern stock, is unexplainable. The present offering of pears has been the heaviest in the history of the industry for this season of the year and prices, if anything, showing a sharp advance over the previous day's sales.

There is a strong demand for all varieties of fruits, with the possible exception of freestones, the market on which took a decided slump during the past week. This cannot be attributed to competition from Eastern fruits but it would appear that the consumers had a surfeit of table peaches. Clings are in very sharp demand at extremely high prices. The offerings are not very heavy, but the stock arriving in good condition is being bought in freely.

The market on plums did not react from the week previous, but remained about the same level. Practically no lower sales but the offerings, which were very heavy, moved rather sluggishly.

The heavy shipments of Malagas now arriving in the East do not seem to have affected the demand. Fruit is carrying in good condition and on account of being well sugared, the offerings are being disposed of freely and stocks in the retail stores cleaning up at practically no losses. We anticipate that the demand for Malagas will be active at satisfactory prices, throughout the remainder of the season.

What few Tokays have arrived in the East, showing color and sugar, sold for high prices. The first car of Florin's via express made a satisfactory sale. Florin stock is in good condition and well colored and should move to good advantage. Lodi Tokays moving

in light supply. Shipments will increase next week and will be well under way by the 5th.

There is still considerable speculation on wine grapes. The stock that has arrived in Eastern sections has sold at an advance of 50c to 75c over the prices received for the corresponding date last season. It is predicted, and the prediction well founded, that if wine grapes arrive in the East in good condition and well sugared, that there will be a market for all the offerings regardless of the tonnage. The demand seems to be unusually strong and prices will, in some instances, on good stock, rule higher than table grapes.

Shipments of tree fruits are light and the season on this stock should pretty well clean up, with the exception of Mountain Bartlett, within the next two weeks.

Outside of a few market flurries caused by strike conditions which have unsettled certain sections all markets are ruling strong, demand active, and conditions as a whole very satisfactory.

Averages for the week:

NEW YORK: B. Hardy Pears, \$3.50; Bartlett, \$3.85; Tuscan Peaches, \$1.94; Elberta, 75c; Albright, \$2.67; Crawford, 80c; Malaga Grapes, \$2.67; Tokays, \$3.30; Thompson Seedless, \$1.70; Muscats, lugs, \$1.67; Kelsey Plums, s/c, \$3.30; Kelsey, box, \$3.50; Tragedy, \$1.40.

BOSTON: Elberta Peaches, 93c; Crawford, 85c; Lovell, 90c; Albright, \$2.37; Bartlett Pears, \$4.25; Malaga, \$2.50; Thompson Seedless, \$1.67; Tokay, \$3.37; Muscat, \$1.87.

CHICAGO: Bartlett Pears, \$3.52; Malaga Grapes, \$2.20; Seedless, \$1.65; Elberta Peaches, \$1.14; Lovell, \$1.23; Crawford, Grand Duke Plums, \$1.82; Giant, \$1.60; \$1.16; Grand Duke Plums, \$1.82; Giant, \$1.60; Gros, \$1.75.

Special Citrus Market Report

Los Angeles, August 25, 1919.

The orange market is not buoyant. At this season of the year there is an abundance of deciduous fruits on the stalls which compete with all varieties of citrus fruits to their detriment. To make the situation a shade worse, the offering of Valencia is unusually large for this season of the year.

Quotations range from \$4 to \$4.50 for choice fruit down to \$2.50 to \$3 for inferior grades. There is no fruit leaving the

State at this date owing to the railroad tie-up. There are between 4,000 and 4,500 carloads of Valencia still to ship of this season's crop.

There is also a noticeable let-up in the demand for lemons, though prices still rule high. Quotations are \$5 to \$6 f. o. b.

According to latest report, shipment of oranges for the season to date are: Oranges, 30,700 carloads; last season to date, 13,000; lemons, 8,750; last season, 5,050.

of the cheapest food products on the market at present, dealers say that no demand has yet developed.

Bayos, per cbl	\$6.25 @ 6.50
Blackeyes	\$5.50 @ 5.75
Cranberry beans	\$4.50 @ 4.75
Limas (South, re-cleaned)	\$12.00
Pinks	\$6.60 @ 6.75
Mexican Reds	\$5.50 @ 5.75
Tepary beans	\$2.50 @ 2.75
Garbanzos	10.50 @ 11.00
Large whites	\$6.50 @ 7.00
Small Whites	\$7.75 @ 8.00

POULTRY.

Just what effect the strike on the railroads will have on the poultry market it is too early to predict. During the past week prices were steady and unchanged in their range. The receipts have been normal and the local consumption just about enough to account for the arrivals. With little demand for poultry for storage at the present time and no possibilities of shipping surplus stock out of the State or to other sections of the State, together with the fact that no shipments can reach this market except by boat, gives the market a confused appearance for the coming week, with the local dealers deluged week, which the local dealers decline to make comment on.

BUTTER.

All the dairy products are in a chaotic condition today on account of the railroad strike. Butter has been strong throughout the week reaching the highest price for extra since May. On Tuesday when the price of firsts passed the previous day's quotation of prime firsts, the latter became nominal and no bids were made on Tuesday and Wednesday. The advance in price of butter this week was probably due to the higher prices in the Eastern markets. With the railroad strike in progress no more butter can be shipped outside the State, or in fact to many points in the State; as a consequence, it is reported that a number of dealers have sent the creameries' instructions to ship no more butter to this market until the situation clears. Should a shortage of fresh butter occur in this city there is plenty in storage to prevent suffering, but the dealers are not inclined to accept butter that may come in by boat and place it in storage in the face of present food agitations. What effect this refusal to accept more shipments will have on the creameries and dairies remains to be seen.

First	.49½	.49½	.49½	.49½	.52½	.52½
sou. Andeh.						.5

EGGS.

The effect of the strike on the shipment of eggs to this market may not be so serious as it is on butter. However, local dealers will have to cut down on their receipts if eggs sent are to be used in this market exclusively. If shipments continue in excess of local needs prices will doubtless go lower to allow a greater number to go into storage. Up to today eggs were very firm and advanced in price for all descriptions.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

do, Y. A.	.32½c

FRESH FRUIT.

There was a good demand for fresh fruit this week, grapes being the leader with heavy arrivals. Strawberries were unchanged, as were blackberries, but raspberries were again advanced in price. Cantaloupes were somewhat erratic, but on the whole were lower. Other changes in prices were of minor character.

Apples

CITRUS FRUITS.

There were no changes in prices of citrus fruits and the demand is stated to be steady.

Oranges, Valencia	\$4.25 @ 5.50
Lemons, fancy	\$4.50 @ 7.30
do, choice	\$5.00 @ 8.50
do, standard	\$4.50 @ 4.50
Lemonettes	\$3.50 @ 4.50
Grapefruit	\$4.00 @ 5.00

DRIED FRUITS.

The buyers have retired entirely from the dried fruit market so far as negotiating for further supplies is concerned. It is stated that none of them would be willing to buy at the present time at a considerable reduction on the figures given below at which the latest sales were made. In addition to the general situation the railroad strike has complicated matters to such an extent that few buyers would take a carload of fruit at any figure. As one dealer expressed it, "The bottom dropped out of the market."

Apples\$20 @ 22
Pears16 @ 18 1/2 c
Peaches17 @ 18 1/2 c
Apricots24 @ 30
Prunes12 @ 13 1/2 c

do, Calimyrna16 @ 23 c

RICE.

Quotations of spot rice were unchanged this week at \$12.25 for fancy and \$11.85 for choice. Futures were somewhat weaker at \$11.00 and \$10.75, respectively. Paddy is nominally quoted at \$4.25 and \$5.25 to growers.

HONEY.

Recent announcements, indicating a shortage of refined sugar, has put more heart in the local honey market, and the demand is said to be on the increase. Several shipments from the Valley were said to have been on the way when the railroads were tied up by the strike.

Water White Orange Blossom18 @ 20 c
White to water-white sage (subject to production)18 @ 20 c
Amber Mountain (Sage-Buckwheat)	16 @ 18 c
Light Amber Alfalfa14 @ 15 c

WOOL.

The wool market is firm, both on the Pacific Coast and at the East. Growers and dealers are confident of the value of their holdings, and are not overanxious to sell.

COTTON.

Cotton closed in New York last Tuesday steady at a net advance of 3 to 16 points. Spot cotton, quiet; middlings, \$32.25.

ALFALFA.

The Alfalfa Growers of California, Incorporated, 525 Central building, Los Angeles, furnish the following quotations on alfalfa hay, which are selling prices to purchasers of carload lots, f. o. b. Los Angeles. The grower, to arrive at his selling prices, f. o. b. his station, should deduct the carload rate of freight from below quotations:

No. 1 dairy\$27.00 @ 28.00
Standard dairy\$24.00 @ 26.00
Stock alfalfa\$17.00 @ 19.00
Standard alfalfa\$21.00 @ 23.00

and bulls at Stockton on Thursday, September 18. San Joaquin county embraces a rich dairying section, yet this is the first sale of its kind to be held at Stockton, and dairymen will find it an excellent opportunity to secure high-class foundation stock to add new blood to their herds, or to secure registered bulls for grade herds. To give an idea of the quality of the stock to be offered it is only necessary to mention the bulls at the head of these great herds. King of the Black and Whites has 39 A. R. O. daughters—the largest list of any bull on the Pacific Coast. Supreme Glista Pietje, the king of high testers, is from a cow with two 32-pound records and his dam, her full sister and seven nearest dams have an average of 4.5 per cent butterfat. That's the kind of breeding that makes profitable producers.

RIVERSIDE FAIR PROMISES BIG.

For several years the Southern California Fair at Riverside has ranked next to the State Fair in importance and this year it will be no exception. W. W. Van Pelt, the live wire secretary and manager, says they are going to have a whopper of a fair, both in the livestock and agricultural divisions. He is arranging to more than double the space for cattle, sheep, hogs and goats, and even then it is expected that there will not be enough room. The largest tent that has ever been used has been secured for general exhibits and it will be more than filled, as several counties are competing for county prizes.

The fair this year will be more of an educational institution than ever before. The judges are men of statewide notoriety and not only will they act as judges, but will be on hand for any information called for during the fair. The Farm Bureau is establishing a tent in which demonstrations by specialists will be conducted. Prof. Voorhies of the State University will be on hand to assist in the work, as well as farm advisors and assistants from different counties.

WESTERN BERKSHIRE CONGRESS SALE.

The Western Berkshire Congress announces a sale of bred sows, gilts and young boars to be held in the show ring at the State Fair following the judging of the Berkshire classes Tuesday afternoon. This sale is made up of donated consignments of breeders as a means of raising funds for carrying on Berkshire promotion work and posting the special Berkshire classes at the Fall shows. The donation sale plan was inaugurated last year when W. M. Carruthers was President of the Congress and proves to be a good means of raising funds. A nice lot of pigs have been consigned to the coming sale, which will be cried by Col. Ord L. Leachman of Sacramento.

FOR SALE ON ACCOUNT OF DEATH and dissolution of partnership, our home of 67 acres; 50 acres nuts and fruit. Good income. No gravel or waste land; some alfalfa. Beautiful location on the S. P. R. R. 11 miles from Sacramento; 1 mile from Elk Grove. Fine schools; good roads; all conveniences. Place noted for its fancy products. See some of these in Sacramento County Exhibit State Fair. Buildings, pumping plants, etc., A-1. Price includes tractor, team, farm equipment, farm tools, etc. No better bargain ever offered. Tribble Bros., Elk Grove, Calif.

DAIRY AND ORCHARD RANCH for sale by owners, about 120 acres. Good location, new buildings. Will be sold on easy terms and reasonable price. \$10,000 will be accepted as first payment. Alex T. Gibson, P. O. Box 561, Chico, Cal. Residence, 216 East 1st Ave., Chico, Calif.

WANTED—By young married farmer, to rent a ranch for cash or crop share, suitable for raising hogs, cattle or sheep. One fully stocked preferred. Address E. F. Ladouceur, Concord, Cal.

The New 16 valve Twin City Tractor PAYS BIG DIVIDENDS

For the first time in the history of the tractor industry, the 4-cylinder, 16-valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16-valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last, and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Special Livestock Market Report

Written for Pacific Rural Press.

San Francisco, August 27, 1919.

CATTLE—The American National and the California Livestock Associations are attacking the alleged "packing trust" and are asking the Senate Committee on Agriculture for federal control of the packing industry. According to the local association the things aimed at are: A licensing system which will place the packing industry directly under the control of the Department of Agriculture. Taking control of stockyards from packers and throwing them open to all under reasonable and equal conditions. Wrestling control of stockyards' newspapers, market news, commission men and banks from the packers. Declaration that privately owned refrigerator cars are common carriers. Establishment of foodstuff warehouses under the provisions of the pending Kenyon bill. The local supply of beef cattle about equals the demand. Agitation over the high cost of living and reduced demand makes a weak market. It is reported that stock growers are not buying feed for winter use, as the price of beef does not justify the high price of feed. Cattlemen will feed only such stuff as is grown by themselves.

for the Tough Jobs

The Outstanding Feature of the Wichita and Aberdeen Tractor Demonstrations—the Twin City 12-20—Powerful, Durable and Dependable.

 All-Steel Thresher

 12-20;

THIS NEW 12-20 has a great reputation to uphold. Therefore, before offering it for sale, it was put into service on every kind of field and farm work—the toughest jobs, the hardest strains—to make it prove its strength and power and stamina. We are proud to put our trade-mark on it. And every farmer can be proud to own the tractor that bears that mark.

Here Are a Few of Its Striking Features:

Four-cylinder, vertical sixteen-valve engine, valve-in-head type, with removable cylinder sleeves and counterbalanced crankshaft. (For the first time this powerful type of motor is applied to tractor use.)

Sliding spur-gear transmission, two speeds forward, direct drive on both. Easy of access, dust proof and running in oil. Bosch high-tension magneto with impulse starter.

The Twin City 12-20 Tractor is produced in one of the largest tractor factories in the world, by the most thoroughly skilled mechanics and some of America's foremost engineers.

It will prove the most dependable and economical tractor for any farmer to buy.

Write us today for complete details. Also ask for full particulars of the Twin City All-Steel Thresher.

Tractor and Implement Prices Going Up

Written for Pacific Rural Press by R. E. Hodges.

IM GOING TO HAVE A TRACTOR, all right. Horse feed is too expensive. Horse chores take too much time. Horses are too slow in hot weather. Horses require too many men to drive them and we can't get the men. But I'll wait a while until tractor prices come down."

You will wait a long, long time, my friend, and meanwhile you will lose more in the expenses you mention than any possible reduction in tractor prices could save you. You will also lose your opportunity to enlarge your operations so as to make the most of the prevailing high prices for farm products.

We have written direct to the headquarters of all the leading tractor manufacturers asking two questions: "Are tractor and implement prices likely to be lower within the next twelve months?" and "Why?"

their Pacific Coast prices, but they are considering a return to their former figures. Prices have in a few cases been reduced on one or more machines made by a concern, but not on their remaining machines, showing an attempt to unload not based on cost of production. Several have raised their prices recently and others have avoided raising prices only because their business had increased to so great a volume this season. Still others expect to advance their prices within a few months. One manufacturer points out the great probability that reductions in weight of machines, increased power and speed, eradication of faulty machines, and improvements in design will enable purchasers to get more drawbar horsepower for their money.

Wage Drop Must Precede Lower Prices.

The only possibility for further reduction in prices of farm implements

This tractor is doing better work than four horses could do; but it is going where only one horse could go. Guardsheets over the cultivator prevent damage to trees whose branches in the picture are drawn away to expose the harrow. Tractors and implements to fit every condition of California farming will be shown and worked at the Tractor Demonstration to be held near Los Angeles September 16 to 21, under the auspices of the Traction Engine and Implement Dealers' Association of Southern California. This will be the greatest opportunity you will have to observe the improvements made in tractors the past year, and to compare the various makes and sizes that may be suited to your conditions. You will meet at the Demonstration thousands of tractor users whose experiences will help you greatly. You will see the machines in action at belt work and pulling all kinds of implements for seedbed preparation, crop cultivation, and harvesting. No other opportunity will be so good or so inexpensive or so profitable as this will be for you to see just how economical tractors and tractor implements can be for you. Take also a careful study of motor trucks and trailers, which can do for your horses on the road what tractors are doing in the fields. Figure up how much it is costing you per ton per mile to haul your farm products to market, including a man's time. Then at the Demonstration find out how much it will cost per ton-mile to haul the same products by truck and trailer. The power farmer is the one who will illustrate the survival of the fittest.

These manufacturers are scattered all over the United States, but they are all facing the same conditions, and they unanimously made the same reply with various added explanations.

Tractor prices cannot be lowered during the next twelve months, but they are likely to be raised. The reasons are that labor costs are higher than ever and promise to go up. Materials are costing almost as much as when present prices were fixed and they also are likely to go up because labor is the chief factor in their production.

A very few makes of machines have been lowered in price this year. Tractor men who did not shave prices are unanimous in saying that those who did were merely attempting to get rid of overstocked or obsolete models. At least one company which reduced prices did it because too great a differential seemed to have been named between their Eastern and

admitted by manufacturers or economists is if wages of laboring men should be reduced. But they all agree that wages cannot be reduced until the cost of living goes down, which means lower prices for farm products.

Strike conditions at the present writing indicate that workingmen do not intend to permit any lowering of wages, and the universal success of strikers indicates that they will have their demands for increased wages.

We may well accept the present price levels and bank on them. The history of previous wars has shown that post-war prices decline very slowly, getting back to normal only after a decade of high prices. The leaders in statesmanship and business emphatically state that we are on a new and permanent high-price level. The farmers who first make up their minds to this and conduct their business accordingly will soon be forging ahead of those who wait for lower prices.

RACKET A RELIEF RECOURSE.

THICK fog spread between the promontory whence we chose to see the war-fleet entering the Golden Gate, and we saw no more of that glorious portal nor the contents of it than did Captain Drake 340 years ago, but he was knighted for the discovery of it just the same. But the sirens shrilly cried and the cannons roared beneath the cover until the rocks of our lofty perch trembled, and we knew as well that the great marine spectacle was transpiring as though our spectacles had revealed it to us.

Trumpets blared and the throng cheered as the exponents of California's pure-bred animals swung into the Grand Parade at the State Fair and the sounds thereof might have reached the ears of the lone watcher on the dome of the State Capitol though sight of the impressive pageant might not enter the range of his vision.

As we write, the President of the United States is going forth from the National capital to lift up his voice in the hearing of the people in all parts of the country, from the Washington monument to the Golden Gate, and selected statesmen are following him to shout discordant refrains into the popular ear. All will hear this jargon of politics and patriotism and grow wise for the country's good, though relatively few can actually see the geysers whence the oratory gushes forth. The scriptural injunction was not to him who hath eyes to see, but rather "he that hath ears to hear let him hear"—for manifestly the auricles are the chief gateways to the souls of men.

It was no platitude to declare, as did our forefathers, that the fundamental requirements of this country's greatness and longevity are "free soil, free speech and free men," and probably the application of the principles involved in such embodiments of freedom was never more essential to the welfare of the American people than at this moment. The only relief from riot, rebellion and social and industrial disorders which now threaten us, will be found in recourse to racket. It is the American safety-valve!

EVEN A TALKING-MATCH MAY HELP.

The great swing-around of patriotic, political and even partisan oratory which will cover the country from the fountain heads of such uproar at Washington does not appeal to us as the most important line of racket which is about to be raised. It may, however, help to direct the ears of the people to a deeper sound. It matters infinitely less, it seems to us, how we stand related to the outside world than how we stand related to each other in honest efforts for the permanence of this country and the prosperity of our own people. If we understand each other and patriotically strive for our own good will toward each other in our social and industrial relations and for our own qualities of citizenship, we shall incidentally achieve a national solidarity which will not only take care of itself in the world, but will exert the most potent influence in leading the world aright. Therefore, we count a cordial and patriotic league

of Americans to secure fair-dealing and good will among ourselves as a thing more important, more likely to endure, and more humanly beneficent for the outside world also, than our participation in the patched-up league of nations, which is now proposed, can possibly be. Therefore, we desire to place emphasis upon that proposition.

It is announced that President Wilson will not wait for Congress to arrange for a general conference between those who are actually participating in production in this country and those who are employing others, or are financing those who are employing them. The proposition has been mooted for some time, but Secretary Lane put the matter concretely on August 28 in this way:

Events seriously threatening the welfare of the country are rapidly drawing to a climax. There should be a joint meeting of employers, employees and all other elements directly interested in the industrial problems. While it might be termed a conference of capital and labor, those are rather indefinite terms. While capital, as representing finance, should, of course, have representation, there should also be representatives of management and of those groups, which, under capital, have a more immediate contact with the problems of labor and production as they arise in the mills and shops and on the farms.

First, there should be a determination of the principles that should govern in all relations between employer and employee. This should be founded on good conscience, and should cover the question of wages to labor and return on capital, opportunity for advancement and betterment and recognition of merit. Second, should be the determination of ways by which these principles might be carried out.

These methods should all be laid before the conference and from this basis of known, tested methods, there should be worked out a general program applicable to the whole of our industries—not just one method, but a selection or combination of several methods applicable to the different lines of industry, but all meeting the principles laid down and bearing the endorsement of having been proved in actual practice.

Even if such a conference should be no more in itself than a great talking match, we believe it will be very useful in bringing to the knowledge of all the people, what the contentions are which are dividing the American people into industrial classes, each seeking to have its way regardless of the rights and requirements of the other. All can then judge where fair play and sound principle lie—in the different contentions, or somewhere between them. At present the public mind is confused in the maze of selfishness, self-will and industrial fallacy which seem to dictate the utterances and actions of ex-parte champions and organizations.

REASONABLENESS ESSENTIAL.

What seems to be most lacking in current actions and declarations between labor and proprietary enterprise which employs labor, is reasonableness. We offer no treatise on the subject but cite an instance or two informally.

Last week there was a strike in the Los Angeles district—not because most of the strikers had a grievance, but because they knew a man who claimed to have—what is called a sympathetic strike. And from the beginning there arose what promised to be a general public calamity in the course of which (to mention only one phase of it) much of our fruit crop of the current year would have been lost, the growers of it would have failed to recover the wages they paid for the growing of it; the workers in packing and preserving establishments would have been denied their right to work for their living; other workers in other parts of the country would have been deprived of lines of food which they esteem, etc. And yet it was claimed to be a self-denying, disinterested affair—a sympathetic strike. Is such action reasonable?

Last week throughout the country there were strikes threatened, which may still be menaces for aught we know, because of the high cost of living, the fact being ignored that productions are in good part high in cost because of the high cost of labor, and the claim was made that wages must advance as fast as produce prices advance and labor proposed to lift itself by its own bootstraps! And how about the corollary of that theorem? It has been claimed that wages must be advanced unless the cost of living becomes less, but we hear no admission that the rate of wages ever could be less even though over-production (stimulated by the false notion that there was great profit in it or for higher reasons) should drop disastrously to the

over-zealous producer. The general contention seems to be that wages must advance with the cost of living, but must never decline with the fall thereof, because every employing, proprietary interest in production is profiteering and labor is not. Is that a reasonable proposition?

And how about that brilliant proposition which is now before Congress as a phase of the government ownership of the railways: the Government to buy the roads and entrust their operation to three groups of citizens: (1) the railway workmen; (2) the managers thereof as representatives of the public chosen by the government; and (3) a group of experts of various kinds to direct the management, also chosen by the government—in other words, the labor organizations holding apparently the balance of power in all political parties constitute their own membership directors of one-third of the management and elect the politicians, who will have the power to appoint the other two-thirds thereof. Of this beautiful scheme Judge Lovett of the Union Pacific says:

"If the railroads are turned over to those operating them, with unlimited authority to fix their own wages and hours of work, it is obvious that transportation rates will have to be increased again and again, until they become unbearable. Human nature makes it impossible that human men should be allowed to fix their own wages and own hours of work for others to pay. It is the people who will pay the freight, rather than the railroad owners, that are most interested. The farmer, whose products are worthless without transportation, the consumer, the manufacturer in every line of industry, and, indeed, all the people, will suffer the consequences of exploitation of the railroads by the unrestrained selfishness of those engaged in the operation of them.

Is such a scheme reasonable? Under the sort of government management which we have had during the war the wages of employees have been increased about a billion dollars per year. Who can say how much it will be when employees raise their own wages? It may be claimed that the public has always been damned by the proprietary management of the railways and therefore has nothing to lose! Perhaps so—but is the new proposition any more reasonable?

MAKE A NOISE ABOUT IT.

It seems to us that the only way to arouse the people to fairly consider the reasonableness of such things is to make a noise about them. We have cited several actions and declarations from the labor side, because labor is out in the open doing and saying things in public view and hearing. There are probably just as many things on the capitalistic side of society and industry, the reasonableness of which should be questioned, but capital is not so frank and outspoken as labor, and is therefore not so easy to arraign. That is one of the best reasons for the holding of the public conference at which both capital and labor shall state their claims and each endeavor to impeach the reasonableness of the other. Of all the issues which have arisen during the one hundred and forty-three years of our national life only one has led to martial conflict, and that recourse is universally conceded to be our greatest national mistake. Many greater and more fundamental differences have been settled in the true American way—by way of the platform and the ballot-box. From all the discord and unrest which now exist there is the same avenue of escape, and that is by appeal to the judgment of the American people to decide where fair play and reasonableness lie in any matter whatever. Anarchy and disorder must be extirpated by the enforcement of law. Undesirable citizens must be placed beyond the power of doing detriment to the country, as the law provides or shall provide. All questions which are compatible with honor, honesty and good citizenship will be answered in our national way if we can raise sufficient racket over them.

PACKERS—PATRIOTS OR PARIAS?

In order to sustain the Golden Rule of racket which we have so confidently laid down for American prosperity, national, sectional and individual, we have to admit that in some cases it takes a lot of long-continued noise to clear up some things. For example, there is a great tumult over the meat packers—particularly over the big five of them. All during these passing days we are

hearing so much that our ears are really too full for clear utterance, and still we believe that there will come a clear note through all the racket if our ear-drums hold out. Out from Washington there comes a discordant roar, though we do get now and then pæons of praise for the packers as custodians of the people's pabulum—dispensing it as popular appetite demands, and, in that way, patriots preservative of the national well-being. Now and then also we get condemnatory psalms, declaring that the packers ought themselves to be canned as profiteers who keep the people hungry. We can hardly keep silent during all this uproar, although we must frankly acknowledge that we do not yet know which side to shout for. California seems to be on both sides and we have to claim that the men who are so confident in their declarations ought to know more about packers' operations than we possibly can know. The matter seems to stand in the public eye this way:

Porterville dispatch to the Chronicle, August 23.—Cattlemen almost without exception are unalterably opposed to Government control of the meat-packing industry, and expect to send from the San Joaquin valley some well known member of their association to oppose federalized industry before the committee now holding sessions on the Kenyon measure. Government control has been followed by an absolute lack of efficiency wherever it was tried as a war measure, said one of the leading beef men of this district here today. The same blighting influence applied to the meat-packing industry will mean the ruin of the cattle men of this Coast, who are compelled now to use careful business methods to yield them a profit.

Washington press dispatch, August 30.—The American Livestock Association has long realized the impossibility of proper conduct of the livestock business when subject to the entrenched monopoly of the packer combination, said a message signed by H. A. Jastro, as chairman of the Association market committee. We recognized and endorse the general plan for thoroughgoing and Federal control of the packing business which shall in the future prevent the abuses growing out of world-wide concentrated power preying alike on producer, consumer and wasteful in many of its methods.

Here, then, we have cattlemen in two adjoining counties of California—Tulare and Kern—radically opposing each other in their views of the desirability of government control of packers' operations and in their estimates of the public services of the packers themselves as conductors of enterprises of great public moment. There might, of course, be different views as to the desirability of government control, because that is a matter of opinion to the support of which perhaps adequate demonstrations cannot be cited by either side. We are ourselves opposed to government interference with producers except on the demonstration of immorality and law-breaking, because we believe co-operative action by producers, who are predominantly honest and fair-minded, is all the regulation which production needs. But when two leading producers in two adjoining counties differ so diametrically as to what is good for the cattle industry of California, the situation seems to require noise enough to compel all who have their livelihoods at stake in the business to join hands to get to the bottom of it.

QUERIES AND REPLIES
By the Editor.
Inquirer Must Give Full Name and Address.

Vetch as a Honey Plant.
To the Editor: Is vetch a good honey plants?—E. R. T., Hydesville.
Yes; if its blooming season with you meets a long-felt want. It usually blooms early in the spring and may nick-in very desirably.

Railway Commission and Corporations.
To the Editor: Please tell us if you know of your own knowledge of one instance the Railroad Commission has decided in favor of the common people against the corporations?—Subscriber, Newman.
Yes; we know of a person to whom the corporation desired to give a pass to ride on the cars as much as he wished to and the commission refused to let the corporation do it.
Shy-Bearing Mulberries.
To the Editor: If W. M. S. of Biggs, who complained of the fruit-bearing of a mulberry tree, which he desired only for shade, still desires scions

of a scant-bearing tree, I have a white mulberry which is a quick grower and shy bearer and can supply him. When should they be sent?—W. Sargeant, Box 742, Arlington, Riverside.
To the Editor: I noticed in the August 16th issue of the Press, W. M. S.'s inquiry for a non-fruiting Mulberry. I have a very large mulberry in my front yard that is a non-bearer, and if you will tell W. M. S. to write me in January or February, I will be very glad to send him all the scions he needs to graft his tree with.—F. M. Johnson, R. 2, Box 87, Napa.
Mulberry grafting should be done in the spring—just as the buds are swelling on the old tree, but the scions should be previously cut and kept dormant.

What Grapes and Plums?
To the Editor: I have 20 acres that have been in alfalfa about seven years, and I am thinking of planting it to grapes and plums next spring. What varieties would you advise me to plant? The Emperor grape and the Santa Rosa plum have been recommended. Can you give me any information on them?—F. W. H., Exeter.

We can seldom answer such a question—not only because it involves a business policy which every man ought to decide upon for himself, but because the answer is almost wholly dependable upon what a man can see for himself in his own locality. We know, of course, that the Emperor grape is a largely grown and often very profitable variety and that the Santa Rosa plum is making a good record as a shipping plum, but the really important things for you to decide are: (1) Are either or both of these fruits doing well in your vicinity on such land as you have to plant; (2) as neither of these fruits is of any use except for fresh shipments, do they come in in such condition and at such a time that shippers will desire to handle them from your location. If they are either out of condition or out of time, they will make you wish your alfalfa back again. The fruits you mention are all right and promising in their way. You must decide for yourself whether they are likely to go in your way.

Suckering Rose Bushes.
To the Editor: Is it not advisable, immediately upon appearance of the red-leaved suckers on rose bushes, like the enclosed, to remove them; also the shoots from the roots, like the enclosed, to prune them out? I have always in the East been taught to cut them out, but some think here that the pruning of a rose must only be done once a year and that the sucker branches must be kept until after blossoming.—W. G. L., Geyserville.

It is certainly desirable to rub off all such suckers from the main branches of a rose bush and to dig for them to remove them where they start from the roots—unless you need them to renew the branches. In that case such suckers can be made useful. This of course does not refer to strong breaks of flowering shoots from the smaller branches, for that is the way the bush gets stronger wood to bear larger flowers. One therefore has to use discrimination and judgment in pruning the rose as in pruning any other plant. Pruning by rule is unreasonable and perhaps there is no rule more unreasonable than that you must prune roses only once a year or that you must keep suckers till then. Prune a rose whenever you see a reason for doing it. Every time a rose is cut from a bush it should be done with regard to a pruning effect—that is to help the bush to make strong blooming shoots and not to fritter away its energy upon a great mass of weak brush.

Plowing and Blossoming.
To the Editor: In this neighborhood we make a practice of plowing our orchard as soon as soil conditions permit after the 1st of March. We have not taken the trees into consideration very much, thinking that it would not make any difference to them when the plowing was done so long as we kept plenty of moisture in the ground for summer use. My observations for the past two seasons have caused me to think that the time of plowing may have a very noticeable effect on the number of apples that the trees produce. My experience has been that trees plowed before coming into full bloom produce lightly while those plowed when the bloom is dropping produce best. Now two season's experience is not enough to form any definite conclusions on so I would like to know what your opinion is.—G. S., Watsonville.

This is a very interesting matter, but it is one upon which one should not allow himself to formulate an opinion or conclusion except upon the basis of observed facts which he cannot explain in some other way—that is, he should be unavail-

WANT WORK AT GOOD PAY.
We are going to add more men to our circulation force. They need not have experience or capital, but must be red-blooded, dead-in-earnest fellows, who enjoy interviewing people and are not afraid of hard work.
If you have an automobile, are free to travel, believe in the Rural Press, and would like to present it to others, perhaps you can qualify for the position. It pays a straight salary and is permanent.
If you think you are the man we are looking for, tell us why. Convince us that you should have the position and we will make you an attractive offer.

ably forced to such a conclusion. Our judgment is that to be thus forced to the conclusion which you conceive, would be little less than a pomological calamity, because if all orchard plowing should be deferred until the fruit has set, it would be practically impossible to do it at all over large areas of fruit, or to do it only inefficiently, and that would mean an incalculably serious loss of moisture—not only directly, by turning up the soil to dry spring air, but, indirectly by having a surface which would favor evaporation all summer. Therefore, you must get away from your idea if you possibly can. Keep on observing comparable areas of early and late plowing in the hope that a beneficent truth will shine out in your experience. If after a few years more you cannot escape from your present state of mind that late plowing is the price of fruit, we will try to help you devise a way in which what we now anticipate to be the ill effects of it may be avoided.

Tomatoes Pushed Too Hard.
To the Editor: I have tomato plants which seem to be going wrong. They are now large, healthy-looking plants with dark green vines three to four feet long, but they have not enough young tomatoes on them—especially the larger and more healthy ones, while others have plenty of young tomatoes almost to normal size. The flowers of the large plants blast or fall off. They are on good sandy loam and have been irrigated twice or three times. Is this a natural condition for them at this time or is there anything I could do for them or something I have done to cause this?—J. A. W., Palo Alto.

The young plants which cast their flowers have in some way received more than their share of the water or manure or spot of rich soil and have grown too fast to set fruit. Tomato plants cannot fruit if they have too much prosperity. The faster they grow in the earlier part of the season the less fruit they will set. Let them quiet down and do not give more water unless they show shriveling of the leaves. You may get a late set and a late crop of such plants if the frost does not get in first.

Corn Smut and Walnut Sirup.
To the Editor: Will you kindly tell me if there is a remedy for smut on corn, and if there is one, what is it? I also enclose a leaf from a black walnut which is covered with a sticky substance. Nearly all black walnuts are covered in this way here this season. Will you tell me what is the cause and also what is the remedy?—H. C. H., Gilroy.

There is no remedy for corn smut except to prevent its spreading farther by cutting out and burning smutty ears as soon as they are seen. No treatment of the seed has done any good. That works with the smut of barley and wheat but not with corn smut. Smut is spread by putting manure from cattle fed on smutty stalks on corn land. Such manure should be used on land for other crops. Your black walnuts have scale insects on the bark and the stickiness of the leaves comes from the honey dew which falls from these insects. There is no remedy except to kill the scale insects, and that is hardly practicable on large black walnut trees without greater cost of outfit, material and labor than owners are willing to undertake.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agricultural Weather Bureau at San Francisco for the week ending September 3, 1919.

Stations—	Past Week	Rainfall		Temperature	
		Seasonal To Date	Normal To Date	Highest	Lowest

Horses, or Small Tractors, or Big Tractors?

Written for Pacific Rural Press by R. E. Hodges.

IF YOU HAVE A BIG ORCHARD, will it be more economical to use numerous horses, or fewer small tractors, or still fewer large tractors, in all cases of equivalent horsepower? Anderson-Barngrover, with a young 500-acre orchard in eastern San Joaquin county, says that numerous small tractors are best. They have three 12-20 and four 10-18 tractors.

Why Tractors Rather Than Horses?

Horses have not been used on this ranch except to plow close to the trees. They will not be used, even for that, next year. It is planned to hitch a walking plow behind the tractor plow or other implement, and let a man manipulate it to finish next to the trees.

How Many Horses and Men?

Seven men are kept all the time to run the tractors, in addition to Clarence Anderson, who superintends and "experts" their operation. These seven tractors do the work of at least 72 horses. In orchard work it would require at least 18 men to drive the horses. So the tractors save about ten men's wages, upkeep, and irritations. It may be that the tractor drivers get higher pay than hired "mule-skinners"—they are paid 47 cents per hour; but they are a better class of men—they do better work, use their heads better, and skin the trees less. We were told that they are easier to get than "mule-skinners."

They do not need a tractioneering education, because one man can take care of the troubles on all of the tractors. The writer saw one man started out on a morning recently. He had never driven a tractor. His preliminary education was simply to show where and how often he would have to grease and oil the machine, how to clean and refill the water air-cleaner, and how to operate the levers for various speeds forward and reverse.

Barns, Feed, Harnessing, Cleaning?

The tractors at night are lined up at headquarters and are ready for work the next morning with perhaps a half-hour of greasing, etc. An equivalent number of horses or mules would require a big barn, big storage space for hay, big feed bills, and considerable time nights and mornings and noons in feeding, harnessing, currying, and cleaning up. There would be expected enough troubles among the horses to make necessary a continual rearrangement or laying off of teams.

Could Horses Do It as Well?

"But even if tractor operation cost more, which it doesn't, we get enough better cultivation and enough better results by getting the work done on time, to make up for a great difference," said Mr. Anderson.

"If we used horses we would have to multiply our investment in implements; but the implements would have to be lighter and would not do so good work. It is well known that weed cutters tend to create a hard layer due to repeated use through the summer, and that layer continually grows at the expense of the cultivated mulch on top. This increases evaporation of soil moisture which we are trying to save.

"With our tractors we use heavy weed knives, which go down four inches all summer whether we use them once a week or once a month. We had special duckfoot knives put on a tractor chisel frame. It is the only weed cutter we have found that we could keep cultivating at full depth all summer. That is due to the pitch of the knives and the weight of the frames. This cultivates an eight-foot strip at each trip and pulls a plank or harrow behind. Three trips finish a row.

Does Morning Glory Like Tractors?

"On one quarter section we have various spots of morning glory which the tractors are killing. The only way to kill it is to keep it from show-

ing above ground. With three tractors we run the weed knives deeply over the whole piece both ways once a week. Here is where it is absolutely necessary to get the work done on time every time."

Why Numerous Small Tractors?

It would take three or four of the largest-sized tractors anybody would want to work in an orchard to match the horsepower of the seven small tractors. Use of the large tractors would require half as many men (including the trouble-shooting superintendent), and these men would want

per tractor or 784 hours total loss of time per year going to the fields and returning. Some loss would of course be encountered in bringing machines in for repairs anyway, and it would take some time for the men to come in by truck or automobile for their meals. Assuming the necessary loss at half the time now used unproductively, 392 hours of tractor-man work are wasted. The men are paid on this basis—\$184.24 a year for time unnecessarily used going back and forth. The tractors' time is worth something, much more than that of the men at

than the big tractors do.

"They work up a dust mulch in summer better than small tractors could," says Mr. Dixon. "Their bigger working parts are less affected by the dust than those of the small machine. They guide perfectly and instantly by regulating the speed of the tracks, so that with the biggest one, the driver gets his implements within four inches of the trees but has never skinned one of them. We do prune our trees more uprightly on account of the tractors."

Use Tractors' Full Power.

"Can you load the big tractors heavy enough to make them operate economically in summer?" we asked.

"Well, for plowing in the spring-time," replied Mr. Dixon, "we can give each tractor as many plows as it can handle economically. We can plow close to the trees without getting the tractor too close and without giving it the side draft that a smaller tractor might have to take in order to keep itself far enough from the trees.

"For summer cultivation it would be economical to use a tool 21 feet wide in our 24-foot rows and make only one trip per row each way. That may leave an 18-inch square around each tree uncultivated, but it leaves the tree unscarred, and no weeds grow in that square anyhow during the summer."

Big Tractors Subsoiled Orchard.

About the first job for the big tractor was one which the small one could not have done, yet it proved highly profitable. The entire orchard was subsoiled one fall to break up the hard plowpan. That winter the Calaveras overflowed the ranch four feet deep in places one night, yet the next day no water stood on the surface. Since the subsoiling, this orchard takes irrigation water much better all season. Hunt Bros. and Mr. Dixon do not doubt the economy of their large tractors.

Seven tractors, such as shown above, with seven men, do the work of at least 72 horses and 18 men to drive them.

higher pay. There would be a certain saving in wages, which Anderson-Barngrover believe would be more than counterbalanced by the disadvantages.

Would Big Tractors Do As Well?

Among the disadvantages mentioned are greater difficulty in turning at ends of rows and in getting close to trees. There would be greater loss of time if something should go wrong. It would mean one-third or one-fourth of the power idle instead of one-seventh, as it now is when a tractor is temporarily out of commission. All tractors have to lay up occasionally for adjustments and repairs.

A big tractor, to make economical use of its power, would have to cultivate a full row at once. That would involve either leaving a very considerable strip unplowed or uncultivated along the tree rows or else using implements so wide that it would be next to impossible to avoid chopping the trees on one side or the other. To make two trips per row so the operator could watch one row and get close enough without skinning trees, would require more implements behind the tractor to make economical use of its power than are necessary for the summer cultivations.

Cheaper to Leave Tractors Afield?

Not everything has been ideally developed for tractor use on this ranch—which is to be expected. But experience has pointed the way to definite plans for greater efficiency. Anderson-Barngrover have no adequate equipment for making tractor repairs, but no doubt such will be installed.

A great waste is the present practice of running the tractors in to headquarters at noon and night time. True, they run in at 3½ miles per hour while at work they run 2½ miles per hour, but even at the greater speed a great deal of time, steel, and distillate are wasted.

It is 1¼ miles to the end of the ranch one way and nearly a mile another way, but a half-mile average per trip to the working grounds is estimated by Mr. Anderson. That means two miles a day going to and returning from work. Over one-half hour per day is thus lost for each tractor and its driver.

Nothing but rain ever stops the work on this ranch. It is estimated that the tractors are in use 225 days per year. That means 112 hours per year

certain seasons. The distillate, oil, wear and tear also count something in 392 running hours.

So a 225-gallon tank has been bought. It will be mounted on a truck or wagon for distillate, and smaller tanks will be put on for lubricating oil, transmission oil, grease, and water. One man will tank and lubricate the machines after work hours so they can be kept going practically the full ten hours per day.

No Doubt about Tractors.

There is no question in the minds of the owners that good cultivation is making a better orchard than common; and there is no doubt that tractors are the most certain and economical power to accomplish the needed cultivation when it does the most good.

Large Tractors in Orchard Preferred.

The most pertinent question that might arise in an up-to-date orchardist's mind is whether large tractors or more small ones aggregating the same horsepower would be most desirable. Hunt Bros., who have 340 acres of bearing fruit trees not far from the Anderson-Barngrover orchard prefer large tractors. For a number of years they used a wheel tractor of about the first make put on the market in California. It had ten horsepower on the drawbar, but was so much heavier than wheel machines of the same power now on the market that this make is not manufactured any more.

After a few seasons' use, it became apparent that something was compacting the soil so that about the third irrigation each season would hardly go down. No particular study was made as to whether this was the fault of the heavy wheel tractor or of the implements used, or of their operation. But the old tractor was discarded and heavier machines of the track-type were given the orchard work. One of these is rated at 20-35 horsepower and the other at 22-45 h. p., but they exert less pressure per square inch.

These have given entire satisfaction, according to General Manager F. A. Dixon, and they have not compacted the soil. A man walking in their tracks leaves his footprints in the summer dust mulch, showing that he exerts more pressure per square inch

MADEWELL

The Country Boy the Nation's Backbone

(Written for Pacific Rural Press by Jno. J. Fox.)

The natural law, recognized since time began, that necessity makes men strong, has been grandly exemplified during the past few years. The German Chancellor's adopted motto, "Necessity has no law," we repudiate. For our men have been strong in sacrifice. The fact that success often blinds the eyes of men is another lesson that is generally driven home after a great war or in times of great prosperity. The present reconstruction period is no exception.

The immense demand for our farm products and the high cost of labor have resulted in creating unheard of prices for our wares, yet employers in all the rural districts are more or less uneasy. Why? Conditions are hard to define.

In talking with farmers in different sections of the State on the subject of labor shortage the following points are brought out. We expected, as soon as demobilization started to find our experienced agricultural boys drifting back to the land—to the business they know. What has happened?

The stirring events through which they have passed have produced a feeling of unrest among the lads that only time and perhaps necessity and reflection can overcome. Large government works and corporation construction plants are paying enormous wages and the boys are naturally excited and think they can do better "with the bunch" at the "works." Thousands are peddling small things, living from hand to mouth rather than settle down again. Extraordinary demand has increased the cost of everything and though we are willing to pay all that the traffic will stand many men will rather hang around the city from strike to strike than return to "the land."

One farmer said, "I have sold my cows and will turn stock cattle into my pastures and raise grain or pasture on my farming land. My brother and I are centering all our efforts on our prunes, pears and grapes now and letting everything else go. Our men are really blind to the opportunity they will have now for a year or perhaps two of making big money. 'Labor' has the right to set prices on what they have to sell and (Federated) they have the power to do this. Now they want to set the prices on what we have to sell, no matter what we have to pay for labor or production. And the cost of production varies (apart from the cost of labor) enormously with the seasons, as was instanced last year. This would be simply reducing the farmer to a virtual condition of slavery again."

The Farmer Has to Take Many Chances.

Against wind, rain, plague, insects, fire, frost, drought, water, overproduction, unstable markets and what not. Apart from the interest on his investment, the farmer today would consider himself rich if he could net 75 cents or \$1 an hour for his own personal hours of labor. But he has to pay \$1.50 an hour for any work done at a garage. We are not talking of the few wealthy big operators, but the average farmer. Some ten years ago the Government figured the net income of the farmer of the United States at an average of less than \$600 a year on which he had to support his family. The past few years he has been making money, for he has had to redouble his efforts to feed tens of millions of unproductive men and women. The shortage of farm labor is going to make the cost of production still greater. This cost is away up and the middle man "has to live." The sooner the farmer-boy gets back to the fields where he belongs and takes a lead again in rural activities and intercourse, the better it will be for him and all concerned. It is a fact that during the season of reconstruction after a great war, a period of prosperity follows for a time till that which has been destroyed has been replaced and till projects that have been delayed are completed. When all requirements have been filled there follows generally a period of reaction. Everybody knows this.

Why Then Are the Eyes of Men Blinded?

Now is the time of plenty of work

and good wages. Now is the time of opportunity by steady application to provide for the future and own a home—either in town or country. One of our wise old forbears depicted "Opportunity" as a glad some maiden, fleet of foot, with outstretched hand. Grasp that hand before it is out of reach and you are carried blithely along to "Success." If her brightness is too blinding, put on your contemplative smoked glasses and then grab that hand. "Prosperity," her twin-sister, will clasp your other hand and all you have to take care of is your head and your feet. In other words retain your balance and "watch your step" to avoid a fall.

That completes and summarizes one complete phase. The next one shows us that forbearance and encouragement are needed for practical reasons.

Not a week goes by that we do not meet one or more returned soldiers—sometimes several. The feeling of unrest when they first leave the army we can well imagine. They have been torn from peaceful pursuits and subjected to an iron discipline, foreign and distasteful to the American character but suffered because the country demanded it. They have been put into the highest physical condition and then suddenly deprived of all and it is too sudden. They are all restless and uneasy like a racehorse that has been put in tip-top condition, then slipped into an empty corral or hitched to a sled. Several different men said they were going to the mountains to "get hold of themselves"—to sleep and rest and "get this militarism out of their system." One came into the office yesterday who had been staying two months with his folks in Salt Lake; he was "so uneasy he couldn't settle to anything, but is now feeling on edge for something definite to do." He has a little money and we helped him a little about locations. He was in the 91st on the Argonne. Another we met on the train going to Sacramento who was very blue but tried not to show it. He had made definite arrangements to stay one month in Modoc County to "try to adjust his mind to changed conditions," God help him! and then go to work. He hoped to get on a newspaper. We took him in to dinner and learned much. There are doubtless many fathers who say, "My boy has been back a month now and he hasn't done a darn thing. The army life has ruined him." No allowance is made for a psychological condition which is quite general.

Give the Boys a Little Time and They Will Gradually Come Round.

That army life no more ruined them than it did the veterans of the Civil War. As time is given them to digest the reason for the great "shake" and their part in it, they will come round and be better men than ever for the experience. My own lad sails in with the fleet after an absence, largely in European waters of over two years. We fathers must give the boys plenty of rope and they will work out their own salvation. The boys must understand their own condition and feel that it is recognized by others, and parents must have patience. Boys that are worth a whoop will "take on" as soon as they can "keep hold."

Who Are the Greatest Losers?

The small farmer who does his own work and is generally helped by his family is the greatest sufferer apart from the boys themselves. These are busy times and the father is naturally anxious for his son to "buckle to" pretty soon after he sheds his putties. He must not be surprised if the boy finds it impossible to adjust himself to such a quick change. The best way is to talk things over frankly in the family. It is to the interest of both for both to have an interest in the

work—a share interest in the business will put quite a different complexion on matters. The boy will find himself anyhow, but how much quicker he will find himself when there is a chance for "standing," teamwork and real personal interest. Friendly advice is going to help the boys where punching them up and bawling them out will hinder. We fathers have the experience and the equipment, the boys have ambition and "pep." They have learned the lessons of discipline and organization. After those tense nerves and muscles have slackened off a bit, youth and maturity will make a dandy team. "Toleration" is the word—and it has to be mutual.

The ideas in this last paragraph are taken direct from a gallant young soldier who has been through the mill of disciplinary experience and has found himself. After our boys have had a good furlough they will return and report for duty. Meantime we have to "carry on."

In a recent report from A. G. Robinson of the California Associated Raisin Co. announcement was made that grapes will be tested by the association free of charge to determine their sugar content. This is one of the means taken by the growers for making better raisins.

Tulare Citrus District Under Review

(Written for Pacific Rural Press by D. J. Whitney.)

From Fresno county south to Kern county, along the thermal belt close to the foothills, and centering mostly around Porterville, Lindsay, and Exeter in Tulare county, is the great citrus district of Central California. Most of the acreage is yet comparatively young, so the importance of the district for citrus production is bound to increase greatly when this young acreage comes into maturity.

Up to a few years ago the prospective fruit grower in the district, particularly in Tulare county, never figured upon planting anything but oranges, provided he had the land, water, capital, and imagination. There were some exceptions—mainly persons whose capital was so scant that they thought better to try cheaply established, early-maturing deciduous fruits, like peaches, or possibly olives or grapes. The standard planting, however, was oranges, save in the small and very favorably located Lemon Cove area, where excellent results with lemons gave the district the name.

Troubles of the Orange Grower.

The fairest summary of the citrus situation in the district at present can be gathered from two facts: First, the average grape grower, or grower of deciduous fruits, will say that he would not take an orange grove as a gift. Second, those citrus growers who stay with the game and have undeveloped land, practically always plant it to oranges when they plant anything.

The explanation is simple. There are more ways to get into trouble with an orange grove than with anything in the fruit line available, and people who do not play the game right usually find most of these ways. But from the other side of the question, when the orange business is handled properly, even when bad seasons, frosts, the June drop, and everything else in the way of trouble is considered, there are few crops that will do as well as oranges.

This condition will apparently always exist; for when ordinary fruit is worth a nickel, an orange will be worth a dime. Their real merit for eating will always, it would seem, make them high in price, and the troubles that confront the orange-grower (and these troubles are all over the world, and not merely in some certain district) are more than offset by the value of the fruit—provided always a person has the right conditions for orange production.

The Troubles Well Repaid.

The only thing that would be worse for the orange industry than the troubles would be not to have these troubles, for if oranges could be produced as easily and cheaply as peaches or apricots, ruin would come with rapid steps. Therefore, when all is said and done, orange growing is a first-class, though very delicate, proposition, and the only man who should go into it is the man who is to go right in every sense of the word. A long purse is one requisite.

In figuring whether to plant oranges or not, there are certain things to think of. First, is soil. In Central California, when a person finds a location suitable for oranges, the soil is quite certain to be satisfactory also. The soil in this district against the foothills is not likely to be sandy, though in Southern California some fine groves are on sandy soil. It may be a chocolate loam, hogwallow, which is sandy clay, red, worthless looking, underlaid by hardpan, expensive to put into condition, but hard

to beat for any kind of fruit when it is finally in shape, or it may be dry bog, first cousin to adobe, and with a full supply of adobe habits. On all of these, and on other types of soil also, first class groves can be found.

Next thing for consideration, but first in importance, is the water supply, which is a serious matter now that a number of dry years has come and land development has drawn heavily upon natural supplies. The orange tree suffers badly if all the water needed is not available at the right time. The fruit grower ought to be sure of water whatever he plants, but he must be more particular with oranges than anything else. Of all suitable fruits for the district figs seem to be the least risk if water may run short occasionally and olives apparently are the second best risk.

Avoiding Frost in Selecting Location.

Then comes frostlessness of location. (There is in reality no such thing. Frost will hit anywhere in California except on islands off the coast, but the term is used to apply to locations where frost injury will not be so serious by far as on the bottom lands.)

In early plantings, when it was thought that oranges were the only fruit worth planting, groves were started far out from the hills where ordinary hard freezes cut back the young trees nearly every year, and it was a race with the frost every fall on mature trees to see whether the grower or the weather would win the crop, the weather winning once in every so often, and a little oftener in these days where fair ripeness is a necessity for fall shipment.

This kind of a location is poor business. Ignoring altogether the risk of crop loss by fall freezes, or the loss of young trees by winter killing, the trees here do not succeed so well as in the more favorable locations. Traveling over all the district in spring, one will notice that the trees on upper and warmer ground are darker and richer in foliage than those on the colder ground. They are not pinched so much by the cold. They develop more in bark and leaves in winter and early spring than those on cold ground. They seem to get a better start in blooming, in setting fruit, and in holding the fruit that does survive the bloom. Therefore, the grower in a frost-favorable location runs less risk of tree-killing, crop-freezing, and has less expense or necessity for smudging, than the grower on the lower, colder land. His trees also thrive better.

Other kinds of fruits succeed so well in this district, both culturally and financially, that a man has no right to plant oranges in a risky location. Many of the older groves, it would seem, had better not have been planted, judged by this measure, but it is also fair to say that many of these groves, planted where a man might figure it was not best to plant, have been, are, and for all that can be seen, will continue to be, excellent money-makers.

The Right Man Succeeds.

After all is said and done in the orange business, the most important thing of all seems to be the man behind the venture. A poor stick may do fairly well with many crops, but it takes the right kind of a man to do well with oranges, and, in spite of many complaints and troubles, the right man seems to find oranges extremely profitable.

The prospective planter, therefore, must figure whether he is the right

The **FRUIT GROWER** says—
"for tree planting
genuine **GIANT** is
most satisfactory"

The Giant Farm Powders—Eureka Stumping and Giant Stumping—loosen and pulverize the soil instead of packing it and throwing it high in the air.

Western fruit growers have used hundreds of tons of these Giant Powders for blasting beds for trees. They have proved that blasting with genuine Giant Powders provides free drainage, increases moisture-storage capacity and insures vigorous growth and early bearing.

"My trees planted three years ago in beds blasted with Giant Powder are 75 to 100 per cent bigger and better than the trees that I planted in dug holes," writes H. H. Smith, Oregon City.

You will enjoy reading "Better Farming with Giant Farm Powders." It describes all the new and money-saving methods of blasting beds for trees, sub-soiling established groves and orchards, clearing land, ditching, etc. Write for it now.

CITRUS CONDITIONS IN TULARE COUNTY.

(Written for the Pacific Rural Press.)

"My estimate of this season's crop of Valencia, Navels and Lemons, based on a normal production of 100 per cent, is as follows: Valencia oranges 80 per cent, Navel oranges 70 per cent, and Lemons 90 per cent," said Frank R. Braun, Horticultural Inspector of Tulare county. In reply to further questions, he said: "There has been some difficulty in securing labor for canneries, although the fresh fruit was handled without encountering this trouble. Labor is in demand for harvesting grapes and figs; is, in fact, quite short." The acreage of citrus fruit to be fumigated this year will reach roughly about 2,500 acres. Liquid gas will be used exclusively."

PUT THIS DOWN IN YOUR NOTE BOOK:

"Pacific new and re-nued pipe saves me money."

Renewed screw casing costs from one-half to two-thirds less than standard pipe. Large savings on standard pipe, fittings and valves; special fittings made to order. Pacific Pipe is thoroughly tested and guaranteed for 150 pounds working pressure; asphaltum dipped; serves every purpose. Let us save you money. Write!

PACIFIC PIPE CO. 230 MAIN ST. SAN FRANCISCO

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also E A G L E Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc. And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be., Sulphur Paste, Nicotine, Black Leaf 40, etc. Fungicides and Insecticides. Carried in stock and mixed to order.

TELEPHONE KEARNY 871.

man and whether or not he has soil, water supply, and location for a good grove, and lastly, whether some of the other fruits that are having a tremendous boom in the district, would not suit him better, after all. To guide him in his choice he will find many fruit-growers swearing at oranges, and many orange growers saying nothing but letting other fruits alone while they plant more oranges. "Every man to his taste," is an extremely wise policy.

REMOVING ROOT-KNOTS IN SUMMER.

To the Editor: Noting an inquiry relative to removing crown-gall from trees during the growing season and your suggestion that readers send in experiences, I send mine. I have theorized like this: The diseased tissue (or galled tissue) does no good to the tree and the tree cannot suffer if it is removed. I have cut out great areas from large cherry and plum trees during the growing and dormant seasons and covered with either Bordeaux paste or asphaltum. As the Bordeaux later flakes off and the asphaltum does not, I prefer the latter, but whitewash over it to prevent excessive heat radiation. The asphaltum is an excellent disinfectant, sticks closer than a brother, and is cheap. Lately I have used, instead of asphaltum, prepared asphaltum paints, such as Oronite or J. M. Roofing or cement paint. These are in liquid form and easier to apply than asphaltum. They dry readily and form a protective coat over the wound. In no case have we had any bad results from cutting out crown-gall at any season. Sometimes we do not get all of the gall the first time. We watch it and cut again if any gall shows up on the edges of the wound.—E. O. Amundsen, County Agent, Auburn.

FAIR RENT FOR FRUIT ORCHARD.

To the Editor: In renting a fruit orchard for crop rent, what would be correct rent—one-third or one-fourth? The orchard contains apricots, prunes and walnuts.—S. R. B., Linden.

[The usual practice in renting a fruit orchard for crop rent is for the owner to receive 50 per cent of the gross proceeds, said owner providing teams, sprays and all equipment, but no labor of any kind. In view of high prices this practice may have been modified in the past two years of high prices, but we would not care to take chances one year with another for less. The owner usually retains the right to decide on final sales and transacts the business—always when Japanese are concerned.—Ed.]

The 12,000 acre Island farm, near Fallon, Nev., which was subdivided 15 years ago, and since then many times resubdivided is producing very diversified crops and the herds of cattle have been replaced by successful wheat, barley and alfalfa. Douglas and Renfro one of the leading firms on the project threshed 600 tons of wheat, about 200 tons of barley besides growing lots of alfalfa.

Wheat Tractor

(12-24)

FIRST!

to come across the continent—the WHEAT TRACTOR—(12-24). It is the most remarkable accomplishment ever attempted—or made by any tractor. This unusual undertaking was not designed as a spectacular stunt, but rather as a definite demonstration and proof that the WHEAT TRACTOR can be worked as efficiently on the road as in the field.

3,000 Miles from New York City

drawing a heavy trailer, mile after mile—over "plains"—mountains and desert roads that most of you are familiar with. Stops were made for the purpose of holding plowing demonstrations. At Wichita, Kansas, this same tractor entered the National Tractor Demonstration, finished in splendid form, and—then on its way to Los Angeles, the destination.

EVERY Wheat Tractor

is as good—part for part—as the one that has just completed this remarkable trip. And it proves to us—and it should to you—that the WHEAT is not a "make-shift"—but built to stand the "gaff" under all conditions—a tractor you can depend on, day after day, year in and year out. We say it is the

"World's Standard"

In tractors—and we believe it is. At the LOS ANGELES TRACTOR DEMONSTRATION, SEPTEMBER 16 to 21, you will have an opportunity to see for yourself—a tractor we are proud to offer you—one that you will be pleased to own—the WHEAT—12-24.

Here and There in the Fruit Business

Peaches for the Future.

A big peach nursery is to be started at Porterville, and the entire supply of peach pits suitable has been bespoken from a local cannery. Fifty acres is to be planted later for a supply of peach seedlings to be budded to peaches and prunes.

Australia Is Planting Vines.

Orders have been received by the Department of Agriculture in New South Wales for large numbers of wine varieties of grapes grafted on resistant stocks. Two phylloxera resistant rootlings in strong demand are two of our own California favorites, Riparia X Rupestris, 3306 and 3309. Others are Mourevdre X Rupestris, 1202, and Riparia X Cordifolia-Rupestris 106.8. Bench grafted vines are selling at about \$50 per thousand and rooted resistant stock unworked \$15 per thousand f. o. b.—cash with order.

Tuolumne County Apples.

Most of the apple growers in Tuolumne county have sold their entire crop of apples, orchard run, at good figures, it is reported, as there was spirited competitive buying from several different counties. There is a good crop of excellent quality, which may run to 1200-1400 tons. The apples are of firm quality and carry good color. They also dry heavy. A co-operative packing shed and dryer will doubtless appear another year in this growing apple section.

Large Merced Orchards Maturing.

Driving out to the east of Merced many large areas of orchard are set out and will soon be making themselves felt in the various industries. The Bear Creek Orchard Company has 160 acres in olives—Missions and Manzanillos—inter-set with peaches and apricots five years old and bearing good crops. Figs with peaches inter-set also look very thrifty and promising. A. L. Munger has 120 acres of thrifty young figs and 40 acres in olives, and M. D. Wood has 95 acres set to walnuts and five acres of figs two years old, in one block. George Boyd has 160 acres set to figs in this section—mostly Adriatics. In spite of the fact that help was difficult to obtain, all these places are looking well kept and the trees have made good growth. As the large districts unite to govern their own affairs so is prosperity apparent. Irrigation and drainage are the problems of paramount importance in the inland valleys. And results can only be achieved through united effort.

Grafting Over Red Astrakhans.

Several years ago a certain fruit-grower had a lot of Red Astrakhan apple trees that he wanted to work over to something that paid better, and he chose white Astrakhans. Afterward he was advised by experts that it was no use—he might just as well take them out as "sappy bark" and subsequent rot would do them up. He stripped off the suckers and growth from a number in order to concentrate the energy of the trees on the scions. In a year or two these trees

died. Others he left, with everything growing on them that showed on the trunk and limbs. They are, of course, a mass of brush below, but the trees are sound and healthy; there is no "sappy bark" or blight and the new grafts, now four or five years old, are carrying a heavy crop of fruit. Which looks, as though the heavy growth allowed to remain on, had relieved this strong growing tree of its superfluity of sap and should lead to interesting experiments in other lines. This same grower sprayed his apples for thrips this year as they scarred and russeted his apples last year.

Almonds and the Hand of Providence.

About the middle of July we called on an almond grower of foreign birth to see what he was doing in the shape of mite and red-spider control in his orchard. It was a good-sized orchard of trees 16 or 18 years old of Nonpareils, I X L, Ne Plus and a few Drakes and Texas. The foliage was in very poor condition, and some trees had already lost a lot of leaves. The rest were ashen grey or yellowish. There is no doubt a part of the injury was due to drought, intensified by deferred plowing and poor cultivation, but we noticed that growth had been poor for several years. We ventured, however, to call attention to the injury he had suffered and was suffering from almond mites. To our utter astonishment he gave us to understand that "the trees always begin to lose leaves in July—it was natural. They had to shed leaves so as to mature and fill out the nuts!" We found that he did not belong to the Association or the Farm Bureau Center—the connection of which with the plot one sees."

Cherry Trees Stand the Knife.

The exploded theory that cherry trees cannot stand pruning was exemplified by a story told by C. K. Johnston, editor and publisher of the San Jose Mercury, at the recent meeting of growers and scientists for the establishment of deciduous experiment stations. Commenting on the variability of ideas and practice regarding pruning, he said: "I don't know much about trees but thought my cherry trees needed pruning, so consulted a few cherry men. One said, 'The cherry will not stand pruning. You must let it alone.' Another said, 'You can prune it a little—perhaps once in three years—but great care must be exercised or you will lose all your fruit wood.' Still another man said, 'I will send you the best cherry pruner in the county; he will do what is right. Don't be afraid if you see half your wood on the ground.' Well, I was away three days when I received a phone message that my trees were being ruined. On my return I found some neighbors shaking their heads over the shocking mutilation my trees had been subjected to—they would bear nothing a year following the butchering. Well, to make a long story short, the next year those trees produced the largest crop of cherries they had ever borne. Good bye!"

PERFECT FARM MACHINERY

LACK OF LUG BOXES HURTS
PEAR GROWERS.

(Written for Pacific Rural Press.)
This season has demonstrated most forcibly that pear growers must provide themselves with more lug boxes. The canners have not been able to provide enough boxes fast enough to serve growers, many of whose supplies of field boxes were wholly insufficient to serve their needs. From this condition a considerable loss has been suffered.

No. 1 Pears Sold as Windfalls.
One pear grower said: "Because the canners were not prompt in furnishing boxes I lost five tons of No. 1 pears—had to sell them for windfalls." Now five tons of pears at \$85 a ton is \$425. The pears were sold for \$50 a ton, making a loss on five tons of pears of \$250. Supposing this man had bought, say 200 lugs, at 25 cents apiece, which is \$50. It would have been enough to handle that five tons of pears and so saved \$200, and his boxes would have been returned to him.

We will now record, for the benefit of other growers who were in the same straits, an incident that happened this year. One man, a member of the Pear Growers' Association, applied for a release of his fruit in order that he might ship his pears East. This release was granted him and his fruit was "counted out" so far as the association's sales were concerned.

Full Supply of Lug Boxes Advance
Pears from \$75 to \$85 a Ton.

A few weeks afterward he changed his mind and wanted the Association to sell his pears for him, but they couldn't find buyers for this extra 100 tons. So the grower tried himself and the best offer he could get was \$75 a ton. He had almost given up hope of doing better when the fact came out that he had 2500 lug boxes of his own. The canner immediately offered him the \$85 a ton if he would ship the fruit in his own boxes and the sale was made.

He thus made \$1,000 clear by using boxes that had cost him only \$500, and these boxes were, of course, returned to him. Besides, he was not obliged to wait for boxes or to worry about whether they would arrive in time or not, because he had them on the place.

This year (when good money has been made on pears) should see all pear growers plentifully supplied with boxes for next year. There is ample spare time to make them up in the winter or rainy days and much of the loss and aggravation, as experienced this year, can be obviated.

WET OR DRY SULPHURING.

To the Editor: The only apology I have for coming back at Mr. Davis is that I have received a number of letters of inquiry in regard to wet vs. dry sulphuring.

Some eight years ago some of the first almond growers of Arbuckle clubbed together and bought a dry-sulphur machine. Some of them used it the second year, but all condemned it. If, after six days from dry spraying Mr. Davis finds spiders large enough to "plow their way through sulphur," it is evident he did not get the old spider. Hence he goes after them four times six days apart, which must be discouraging.

I agree with your correspondent of July 19, page 60, that one thorough application as soon as the old spider appears does control them. A thorough application means double-shoot the rows—up one side and down the other. I can show you eighty acres near me, sprayed about the same time and only half done which is now badly infested, while mine is free.

So, too, the difference in cost: Mr. Davis admits it takes three days to dry-spray 50 acres. Three days' time four times over is 12 days with two men and a team at \$10 per day makes \$120. The wet way will take three men 57 days at \$14 per day, making \$70, and my equipment did not cost \$100 more than Mr. Davis'. Besides, it earned me \$70 on the outside at \$6 per day.—I. L. Sweet, Arbuckle.

Pears and figs have been cultivated in California for 150 years.

CULTI-PACKER

TRADE MARK REG.

It Cultivates — It Packs

Culti-Pack After The Drill

Culti-Pack your soil after the grain drill or seeder. You can pull the Culti-Packer and seeder with a tractor at almost no extra cost—or you can pull them separately with horses.

Here are five things you will gain by so doing:

- 1. Quicker germination especially in dry weather, due to firming of soil about seed, and the moisture-saving mulch on top.
- 2. Saving of seed by increasing the percentage of seed which sprout.
- 3. Fewer weeds because the crop will get an early start and choke out the weeds (which are unevenly planted).
- 4. Less crusting of soil on account of the ridged condition in which it is left.
- 5. Better root development due to the fine, compact, moist bed of soil. These and hundreds of other soil facts are illustrated and described by leading soil experts in our 56-page book, "Soil Sense."

Ask your dealer for a copy.

Saves a Team on the Binder

Cushman Binder Engine

The Cushman 4 H. P. is the one Successful Binder Engine. Thousands are in use every harvest. Fits any binder. Engine drives sickle and all machinery. Since horses have only to pull machine, two horses will easily handle 8-ft. binder in heavy grain. In a wet harvest Cushman Engine saves the crop, as it keeps sickle going when bull wheel slips.

Very Important—The weight of the engine on the rear of the binder, only 167 lbs., is balanced by the simple cone water cooler on the front of the binder. This balancing, and the water cooling, to prevent overheating on all day runs, are necessary to successful work in a hot field.

After harvest Cushman engine does all other work. Very light weight and easy to move around, yet runs more steadily than most heavy engines, because of Throttle Governor and perfect balance. 4 H. P. weighs only 190 lbs.; when stripped for binder only 167 lbs. 8 H. P. only 320 lbs. Also 5 and 20 H. P. sizes.

SAME ENGINE FITS

Corn Binders, Mowers, Reapers,
Manure Spreaders, Potato Diggers, etc.

Power Farming Has Come Inevitably

By William L. Hughson.

Power Farming has made such rapid strides during the past few years that the ranchers, orchardists and agriculturists in general, are now confronted with the problem of either adhering to the old fashioned and antiquated way of tilling the soil or adopting the newer and more efficient method of using power farming machinery.

The war has been responsible to a great extent, for the rapid advancement and the perfecting of different power farming tools, for "food will win the war" is a slogan that still rings in our ears; and how this country rushed the food-stuffs to the hungry millions and saved a starving world is a matter of record.

In this speeding up program the tractors and more efficient farm tools played an important part. In one instance the manufacturer of a well-known tractor shipped over six thousand of his tractors to our allies in Europe, whose lands were either devastated or suffering from lack of cultivation because the man power was being used in the fighting lines. Thousands of acres were made to produce their share of food through the importation of these tractors.

Development of Plows.

Since the beginning of time, man has had to prepare a seed-bed. The hieroglyphics on old Egyptian monuments as well as other ancient records, show that a wooden stick was used to make a furrow, and branches and twigs bound together was the substitute for a barrow. While this method is apparently obsolete, it is still in use in some of the uncivilized parts of the world. Seed was broadcast by hand over this crude seed-bed, and even this principle which has been handed down from the ages is still indulged in, in many parts of our own country.

After the wooden stick came the wooden mold board plow, which held sway until an iron point was added to the share to give added wear, and permit working of harder soil.

In 1797 a cast iron plow bottom was made and patented. This had the share, mold board, and landside all in one piece. To renew a worn point meant the purchasing of an entirely new bottom. In 1813 a cast iron bottom was manufactured that more nearly approached our present style.

Then came the single riding plow which was later followed by the two-gang plow. This style of plow enjoyed unusual popularity, showing that farmers are ever ready to adopt any practical device that will lessen their fatiguing work.

It was during this period that the manufacturers began to pay particular attention to the kind of materials that went into their products, crucible steel, shares, soft-center shares and others making their appearance, all with the view of bringing greater efficiency to farm tools.

Many varied and complete mechanical farm tools and contrivances followed in rapid order, such as combined harvesters and binders and other equally important improvements; but with all of these wonderful new inventions the horse was still relied upon to do his part.

Tractor Work Better than Horse Work.

The coming of the farm tractor revolutionized agriculture; of this there can be no doubt. It was not the purpose of the tractor to do the work as well as a horse or a team of horses, but to do it better. It is not the purpose of power farming machinery to do the work as well as the older methods, but to do it more efficiently and more economically.

It is an established fact that the old methods of a farmer's life, with its continual chores and heavy work coupled with long hours, has been responsible for many sons and daughters leaving the old home and seeking the cities, to evade the drudgery that loomed before them.

The newer methods of power farming however have changed the entire

scheme of things, for with the addition of a tractor, modern farm tools, the many mechanical and automatic devices, such as milking machines, sawing machines and others, taken together with the many duties a tractor can perform when the power on the belt is used, has lightened the farmer's burden considerably, doing their work more speedily and surely more economically. This taken together with the many devices now on the market to aid the women-folk on the ranches and farms, has changed considerably the conditions that formerly existed.

The numerous exhibits and demonstrations of power farming machinery held all over the country, have proved much to those who till the soil, and progressive farmers were not slow to see the benefits that would accrue from its adoption.

Many farmers and ranchers are still adhering to the older methods, in a similar manner as the livery men in the early days of the automobile. They finally had to bow to the horseless carriage.

It perhaps is true that the early tractors were somewhat lacking in necessary essentials, but the rapid development of this industry has brought many changes and improvements. It is stated authoritatively that one tractor manufacturer built and experimented with sixty-three different models of tractors covering a period of years, before he put one on the market. This same manufacturer insisted that the tools which this tractor should pull, should be so constructed that they could be operated from the drivers seat, obviating the necessity of having an extra man accompany the tractor to operate the tools. That this latter idea was logical is borne out by the fact that today several of the largest manufacturers are making tools exclusively for use with the tractor and power-lift plows are being demanded by farmers.

The different colleges of Agriculture are strongly urging the use of power farming machinery, which opinion has been reached after exhaustive study and experiments with the modern methods. It has been clearly proven that a horse consumes as much food in a year as can be raised on a four or five acre lot, which might otherwise be used for a productive crop. In the off-season, a tractor and its belt power can perform multitudinous duties on a ranch, while the horse must remain idle.

Behold at from every angle, a new era has dawned for the "man with the hoe," and in a few years one will look back upon the present times, and wonder how it was at all possible for the rancher to produce the food that now feeds the world.

Deformed and puny chicks are unfit to raise. Dispose of all cripples and weaklings as soon as possible.

It takes Brains to recognize a Good Tractor

WHEN you build a tractor to be sold on the basis of the service it gives, it has got to be sold to a man of brains.

Appearances speak for themselves.

Anybody can tell what a Tractor looks like—whether it has three wheels or four, whether the engine is upright or horizontal, whether its gears are enclosed or at the mercy of sand or gravel.

But it takes brains to get at the facts—to look into tractors instead of merely at them.

More and more, the farmers of this country are looking for the facts which determine the serviceability, economy and long life of a tractor.

And they are finding them in the G O type of tractor—the four-wheel, four-cylinder type, towards which the whole industry is tending. There are no tracks or sprockets in the G O Tractor to become filled with sand or to use up power in overcoming friction.

They are finding them in the G O driving mechanism—an exclusive feature which cannot be duplicated or imitated. With the G O friction drive, there is no possibility of stripping gears, because they are always in mesh. The speed of the tractor can be changed while in motion. It can be adjusted to any kind of work either in the field or at the belt—there are six speeds forward and six reverse.

They are finding them in the G O construction—so simple that anyone can keep it running strong and true. Every part is accessible. Every gear is enclosed in dust-proof casings—runs in oil. The driving wheels are independently controlled, making it easy to turn short, plow close to corners or pull out of any hole.

The man of brains, who is looking for more facts—for facts about the company behind the G O Tractor, its resources, its guarantee, and its idea of tractor service—can get them without obligation by addressing any of the offices below.

Suggestive Agricultural Pointers

(Written for the Pacific Rural Press.)

Rice Growers Need Livestock.

Rice growers must eventually undertake livestock, according to Mr. Adams of the Maxwell Irrigated Farms Co. of Colusa county. This company had about 8,000 acres of rice last year, and made good money turning in 2,000 hogs to clean up the stubble.

Hellebore Safe Poison for Vegetables.

Where chewing insects or worms are attacking vegetables or nearly mature fruits, arsenical poisons are frequently inadvisable. Powdered white hellebore roots are poisonous to insects, but only slightly injurious to man and the powder quickly loses its poisonous qualities. It may be dusted onto the plants with twice its bulk of flour or sprayed wet using ten teaspoonfuls per gallon of water.

Before Borrowing, Paint Your Buildings.

A banker states that the appearance of a man's farm influences him as much as its intrinsic value in the amount of money he will lend on it. That is another way of saying that character is as good security as real estate. Paint is one of the cheapest ways of improving the appearance of buildings. If the house and farm buildings are neatly painted as often as necessary their owner is a better risk than one who lets his buildings deteriorate.

Faster Sugar Beet Digging.

A man and two horses working continuously under average conditions will lift approximately 1½ acres of beets per day. A man with four horses can lift two or two and a half acres per day. The amount of work done can be increased by adding an extra horse. It is chiefly a matter of power. In Monterey county that power is supplied in compact form, conveniently controlled by one man in the form of a motor cultivator delivering five horsepower at the drawbar. The digger is attached to this in place of cultivation implements.

Freight Rates on Grain.

The freight rate on wheat in carloads of 60,000 pounds minimum weight, is 64 cents per 100 pounds from California terminals and intermediate points to Galveston, and 68½ cents to New Orleans, according to G. W. Luce of the Railroad Administration. The rate on whole barley in carloads to Galveston and New Orleans is 56 cents per 100 pounds. Carloads must have minimum weight of 80,000 pounds except where cars of smaller capacity are furnished, but not less than 60,000 pounds in any car. This 56-cent rate also applies to whole barley from California points to New York when routed via Southern Pacific, G. H. & S. A., and Morgan line and in connection with the Santa Fe system, thence Mallory line.

Grain Fire Damage Doubled.

To the Editor: Answering your inquiry, we are still collecting data on the damage done by fires in grain fields and on the range. This data will not be ready until next fall, at which time we will get out a statement of the losses sustained in the state this year. The loss of grain has been very large and I think will be at least twice what it was last summer. I investigated a grain fire in Butte county which did \$30,000.00

worth of damage and another grain fire near Byron is reported to have done \$17,000.00 worth of damage. The largest losses were sustained in Glenn, Colusa, Butte, Solano, and Yolo counties. A great deal of efficient work was done by the rural fire organizations of the State, but in spite of their efforts the losses were very high on account of the large amount of inflammable material, dry weather and heavy winds.—M. B. Pratt, Deputy State Forester.

Have Your Scales Tested Free.

To the Editor: I have clipping of your issue of August 16th under the heading of "Have Your Scales Tested." It reads in part as follows: "The State Superintendent of Weights and Measures will have your scales officially tested and sealed at nominal cost." I wish you would kindly correct this statement and advise your readers that the services of this department of every character, whether it be inspection of apparatus, prosecution of complaints, or investigations, are free to the public. This also includes every service of the County Sealer. The payment by any person for any of this service to a Weights and Measures Official constitutes a malfeasance under the Act.—Chas. G. Johnson, State Superintendent Weights and Measures.

Superphosphate Prices.

A 30 per cent reduction in fall prices of mixed commercial fertilizers was forecasted a while back by the U. S. Department of Agriculture. But the reduction is not materializing on rock phosphate and superphosphate so much as expected. Superphosphate in bags in quantities of 30 tons or more was quoted at \$24 per ton f. o. b. Baltimore, Philadelphia and Cartaret last spring and prices asked for fall trade are \$22.50. Strikes in Florida and Tennessee phosphate mines have reduced production. The Department of Agriculture has notified manufacturers of superphosphate not to advance present prices without submitting specific data on real and unavoidable higher costs of production since June, 1919. California superphosphate fertilizers come largely from the copper mines. Two companies in California are manufacturing this fertilizer and there is plenty to supply all demands. The price is \$25 per ton in bags f. o. b. factory.

Weed War Waging.

Various county horticultural commissioners are getting into the weed war under the State law, by which it becomes their duty to see that noxious weeds are controlled. These overworked officials have not had the time required to enforce with gloved hands the law against weeds and have consequently let it lie in innocuous desuetude. But in Solano County Horticultural Commissioner C. M. Gates has been getting results along the highways. In Tulare county Horticultural Commissioner C. F. Collins has been attacking the Arizona thistle around Porterville through Inspector F. A. Doty. The Southern Pacific infestations have been cleaned up and property owners are co-operating. In Imperial county Horticultural Commissioner F. W. Waite has tried ineffectually to keep out the Johnson grass that comes on cotton seed imported from Arizona. He has asked the Arizonans to delint such seed and has given it a second delinting.

The LAUSON Wins Again

The LAUSON Transmission is fool-proof. Even an inexperienced operator cannot strip the gears. All gears are enclosed in a dust-proof case and operate in bath of oil.

at Delavan, Wisconsin

James Murphy, Manager of 1600-acre Tilden Farms, ordered a LAUSON after watching the operation of 26 tractors in a competitive test.

The LAUSON FULL JEWEL TRACTOR did not make a stop for adjustment of any kind from the crack of the pistol to the finish of the Delavan Demonstration.

The reasons for this performance are evident in its construction—its full jewel movement with 24 roller and ball bearings, its dust-proof construction, its gears running in a bath of oil, and the practical agricultural experience incorporated in its design.

Full details on request.

SAVE THAT BURR CLOVER SEED.

(Written for Pacific Rural Press.)

There is always a demand for burr clover seed—every fall. It wouldn't take long to scoop up a lot out of the wagon beds and save it instead of shoving it out of the tail gate with your foot and losing it.

Send the kids out to the little flat by the creek or in that corner of your orchard land where the stamps and rocks prevent cultivation. They can rake and sweep up \$10 worth of seed in a morning. Shake the trash out with a six-tined fork and sift out the dust; then sell it to a seedsman. He will pay you for it and will hull and clean it. It's the little things that count. Any of the big seedsmen are in the market for burr clover seed now. In two months from now they probably won't want it. A garden rake and a bass broom, and then let the kiddies have the money.

MUELLER PIPELESS FURNACE

Features That Guarantee Successful Pipeless Heating

TODAY, thousands of families enjoy the comforts of properly heated homes and yet save money on their fuel bills. The Mueller Pipeless Furnace, an achievement of the engineers and heating experts of the Mueller organization, has made possible this greater economy and comfort.

No longer is it necessary to shut off rooms from the rest of the house in winter. You can heat *all* your rooms properly and yet spend $\frac{1}{3}$ to $\frac{1}{2}$ less for fuel than when using stoves.

Note carefully the strong features of the Mueller Pipeless shown on this page. No other pipeless furnace is designed like the Mueller, and no other pipeless furnace therefore operates as efficiently. For the Mueller Pipeless applies the principles of pipeless heating scientifically and correctly. It gives 100% heating efficiency for the fuel consumed.

The Mueller Book, "The Modern Method of Heating Your Home" explains the Mueller features in detail. Send for it. Learn just how this remarkable furnace is built at every point, how easy it is to install, how easy to operate. Burns hard or soft coal, coke, wood, lignite, gas or oil. Read some of the letters that have been received, telling of health, comfort and fuel saving.

Get full information in the Mueller book, telling why this remarkable furnace is, beyond all question, the most efficient, economical and dependable you can buy—guaranteed to heat the whole house comfortably.

L. J. Mueller Furnace Co.,

Makers of Heating Systems of All Kinds Since 1857

Holbrook, Merrill & Stetson, San Francisco and
Los Angeles, Cal.
22 other distributing points. Immediate shipment to any part of the country.

1 Register face—large in size to deliver the proper volume of warm air into the rooms at low velocity and take an equal volume of cool air from the rooms. A size for each size furnace.

2 Radiator—One solid casting. No bolted joints through which smoke and gas can escape. Narrow oval bottom part with casting flaring outward and upward keeps rising air in contact with heated surface so that it absorbs every particle of heat.

3 Feed Section—One solid casting formed to allow free circulation of air over and around it, also between gas dome and inner wall of radiator. Height aids combustion. Top of feed mouth has an upward slant so smoke and gas cannot escape when door is open.

4 Firepot—Cast in two sections with cup joint between to allow for expansion and contraction without stress or strain. Sides almost vertical—ashes cannot accumulate and prevent radiation of heat. Deep with large coal capacity—fire needs tending only twice a day except in severest weather.

5 Air passages permit free and unrestricted ascent of warm air and descent of cool air. This is essential as pipeless heating depends for its success on easy air circulation. (Indicated by arrows).

6 Special insulated type of hood and inner casing construction. No escape of warm air into the cool air chamber. Outer casings made of galvanized iron. Inner casing of two sheets of rust resisting iron, substantial and durable.

7 Fire door—fits tight. Stays open when firing. Double door makes bigger openings for large chunks of coal or wood. Cast iron perforated plate on inside of lower door has horizontal slide to admit air and make fire burn well.

AGRICULTURAL NOTES

C. C. Morse & Co. report that there is no carry-over of alfalfa seed.

W. V. Shear, well known to potato growers of California, has been appointed to a position in the State Department of Agriculture. He will have charge of the new potato certification law.

The Canadian Government has established commercial grades for potatoes, and is engaged in an educational campaign to extend interest in growing the types which can make the grades.

Public hearings were held in Atwater and Turlock last week to aid the growers in standardization of their sweet potatoes. They must be graded now to conform to the standardization law on fresh fruit.

The San Joaquin County Fair will be held in Stockton, October 6 to 11, inclusive. Ten thousand dollars has been pledged which assures a good fair. The many breeders of premium livestock in the county will show.

The Federal bill apportioning \$50,000 for the stimulation of seed production and seed reporting service has been signed by the President, and California will hold a survey of vegetable and flower seeds as her share.

The Zumwalt ranch, near Williams, and the Parrott Grant rice are declared to be the two best rice fields in the United States, by an executive of the U. S. Grain Corporation, just completing a tour of the rice fields of the country.

The California Bean Growers' Association is securing funds with which to send a committee to Washington to make a fight for a tariff on beans. The tariff will be based on the difference in cost of production between foreign countries and America.

Pension systems of California public utilities for the benefit of employees who have spent their best years in their service, are approved by the Railroad Commission, and the cost is considered a proper charge against operating expenses.

More melons have been shipped out of Madera this season than ever before. One firm, the Arakelian Bros., planted about 1,000 acres on the San Joaquin river and will have sent out by trucks, 12 miles to the railroad, about 100 carloads by the end of the season.

Approximately 300,000 pounds of potatoes were seized in Seattle recently on the charge of hoarding. There were also in storage 490,000 pounds held by Japanese, but these were not touched under the law that allows growers to store their products.

Julius Barnes, Wheat Director, stated before Congress that the average price of wheat to growers paid in July was \$2.20, and in August was \$2.27, or an average of 12c to 15c above the average price during two years of the fair price control, so that the \$1.50 fear was ungrounded.

A shipment of dehydrated products was recently made to the Czechoslovak Army in Siberia by the El. Clemens Horst Company, saving in transportation cost \$20,000 over the ordinary canned food. The plant near Sacramento is now filling a government order to be used for experimental purposes by the Department of Agriculture.

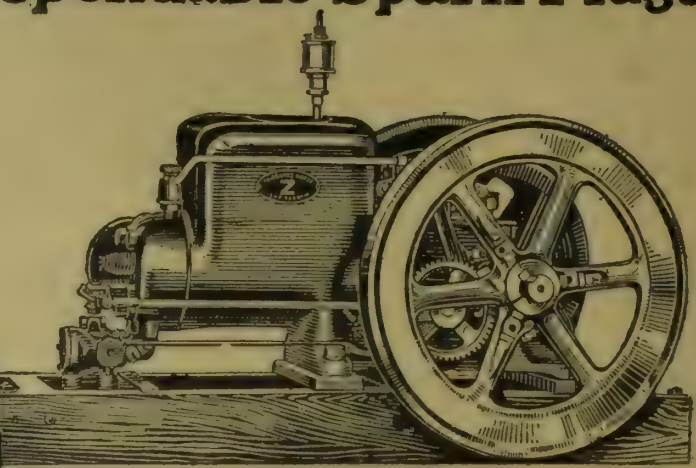

The Louisiana Farmers' Association has figured the cost of cotton production on a 40-acre field, including land rent, mule rent, feed, man labor, fertilizer, seed, etc., at \$2,067. This makes \$51.67 per acre or 32 cents per pound, which indicates an average yield of 161 pounds of lint per acre.

From a little over 14,000 acres more than 118,000,000 cantaloupes were obtained in the Imperial Valley, or one for every man, woman and child in America. Two and one-half million crates were required and 7,830 cars to move the crop. The net return to growers was \$1,710,072. From 800 acres of watermelons over 13,000 tons of melons were taken which netted growers \$66,240 or \$82 an acre.

Champion

Dependable Spark Plugs

**Are Equipment on All
Fairbanks-Morse "Z" Engines**

FAIRBANKS-MORSE famous "Z" kerosene engines for the farm are now equipped with Champion Dependable Spark Plugs.

These sturdy, economical engines are making work easier for more than 250,000 farmers. Ranging in size from 1½ horsepower to 15 horsepower, they are adapted to countless power jobs. They run cream separators, milking machines and washers. They operate electric light plants and water systems. There is hardly a power need that is not met fully and capably by one of the reliable Fairbanks-Morse "Z" kerosene engines.

Fairbanks Morse "Z" engines hold an enviable reputation for performance, economy and quality. The choice of Champion Dependable Spark Plugs as standard equipment for this line of engines, means still another important step in insuring their satisfactory operation under all conditions.

Champion Dependable Spark Plugs have proved their worth in all weather and in all climates on every type of internal combustion engine. Their adoption by Fairbanks-Morse is but one more proof of the high esteem in which they are held.

Price \$1.00

California will be producing over half of the rice yield of the United States in five years and leading all other states, according to a survey made by J. R. Leguenac, chief of the rice division of the U. S. Food Administration. This year's acreage in the Sacramento valley is 140,000, with an estimated yield of 35 sacks to the acre. Our production may exceed that of Texas this year, which will leave us second to Louisiana only. It is estimated that 1,000,000 acres are available for rice planting in the Sacramento valley.

Fifty per cent of the hop crop has been contracted for by France, England, China and Japan. Shipments started last week at the market price of 50c a pound. A higher price is anticipated for those not contracted for, as the demand is strong even in the United States. In the Sacramento valley the crop of 40,000 bales, or 8,000,000 pounds, will be worth \$4,000,000. The yield of the State will be 30,000 bales more, or a total value of \$7,000,000. The acreage around Sacramento of 5,200 acres is a 15 per cent increase over last year, as the demoralization of the 1917 hop market reduced the 1918 acreage. With the prospect of high markets this spring the acreage was increased again. The California crop will be sold in Eng-

Descanso, San Diego Co., Calif.

HORTICULTURAL JOTTINGS

In order to make a good showing at the September fair, the Oakdale Fair committee has arranged to place all fresh fruits grown in the district in cold storage until that time.

The Earl Fruit Company is erecting a new packing house. It was erected at a cost of \$10,000 containing everything modern in equipment. The building has been leased to Pope Bros. and Ray Van Buskirk, who will conduct the packing this year.

Labor shortage is reported from Madera, although as high as \$4.75 a day is being paid for pickers of fruit and grapes. It is reported that one vineyard, picking by the tray, has given its pickers a chance to earn \$15 a day in piecework.

Shelter Clark of Anderson (Shasta county) expects five tons of dried prunes from an acre of ground. His trees have never been cut back and the branches arch to the ground with the weight of fruit. He irrigates several times thoroughly during the season.

The old Gridley Cannery has been purchased by Libby, McNeil & Libby, which is to be dismantled and a more modern plant constructed in its place, ready for operation in the season of 1920. Included also in the plans is the building of a number of cottages in which to house cannery employees.

One rancher of district 10, Marysville, is displaying samples of Sellers and Orange cling peaches, which weigh an average of three-quarters of a pound. These peaches were taken from a three-year-old orchard of Yuba county, covering six acres, and netting the owners more than \$5,000.

The Citrus Exchange of Tulare county have made repeated efforts to secure experts from the experiment station at Riverside to conduct investigations into orange culture and have at last been successful, as J. T. Barrett of the station staff will be here soon to take charge of such work.

According to growers in the Sacramento valley, California's almond crop, which represents 98 per cent of the entire American yield will be the greatest in the State's history. The 1919 crop will probably total around 7,000 tons, or twice the volume of the 1915 crop. The value of this year's crop is placed at \$3,000,000.

Recent contracts have been made indicating a grape movement of 25,000 cars this year, compared with 16,368 cars last year. This is approximately 300,000 tons, valued at \$37,500,000. It is estimated that probably three times the normal quantity of the table varieties will go East. Grape growers are receiving 25 per cent more for their crop this year than in 1918, prices of the table variety ranging from \$80 to \$150 a ton.

Arrangements have been made through organization channels to handle the large over-run this season in small sizes of clings. A large tonnage of cling peaches will not be accepted by canners, due to the hot weather which prevailed during July. The California Peach Growers, Inc., expects to handle this fruit. It is understood that a market has been provided through which this fruit can be sold to yield a fair profit—dried whole.

In hopes of developing the peach most highly valued by the canners, J. F. Dudley, president of the Silva-Bergthold Nurseries of Newcastle, George A. Lamiman, horticulturalist of the company, and Eugene F. Fowler inspected the local plant of the California Packers Corporation, and visited the most famous orchards of Sutter county, in company with Harry P. Stabler, county horticulturist, and A. L. Hill, superintendent of the cannery.

The Viticultural Division will dry most of the crop from the experimental vineyard in the new evaporator, at Davis, which is now practically ready for operation. However, they will also dry on trays in the sun some of the leading varieties of grapes for comparison. The evaporator is designed closely after the one described by Prof. W. V. Cruess in Bulletin 15 of the State Commission of Viticulture.

Tractor Ad No. 40—399 lines

MOLINE

System of Power Farming

You buy a tractor to make money. The more money a tractor or implement will make for you the more you are willing to pay for it.

Consider then what a tractor will make for you in dollars and cents—how much man power it saves, how many horses it displaces, and the more and better work it will do. That is the way to buy a tractor—the purchase price alone should not influence you.

When you buy a Moline-Universal Tractor you get one of the finest power plants on wheels. You get a completely equipped tractor, with self starter, electric governor, electric lights, belt pulley, power lift gang plow—everything you need.

You not only buy a quality tractor, but a complete system of power farming. The Moline-Universal enables you to do all farm work including cultivating. One man operates both tractor and implement from the seat of the implement.

Actual figures from over 200 farms in 37 states show that the Moline System of Power farming saves an average of 1½ men and 5 horses per farm.

Figure what such a saving will mean to you. Considered from this point of view the Moline-Universal is the lowest priced tractor made. Thousands of farmers are proving this every day. Write us today for full information. It's free on request.

	Indianapolis	Columbus, Ohio	Jackson, Mich.	

In a recent report from Auburn, Cal., we are told that K. Myamura a Jap, was fined \$50 by Judge Davis for violation of the new standardization law. The Judge, in delivering his verdict, stated in part: "These violations are becoming so flagrant that the fines will be doubled each time you are brought into court. In this way I hope to put a stop to this illegal shipping!" So it reads this way: 1st offence, \$50; second offence, \$100.00; third offence, \$200.00; fourth offence, \$400.00.

The California Packing Corporation displays an excellent cartoon in its house organ this week, depicting a smilingly expectant "world" waiting to be served with their products by attentive canners. It is labelled "Our Job." This is the right spirit and every productive worker, whether he be the harvester, packing house employee, grower, or freight handler, should look upon feeding the world as "Our Job." To deliberately waste a pound of food, with famine as our near neighbor, is not only criminal but suicidal.

A WADE does 10 mens work Saws 25 cords a day!

A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, feed mills, feed cutters, pumps, etc.

"My Wade Saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have sawed through five-foot solid oak logs at the rate of one foot a minute."—N. P. Myers, Laramie, Calif.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.

Mechanical Power on the Farm

MORE TRACTOR DEMONSTRATION EXHIBITORS.

Visitors to the Los Angeles tractor implement, truck, trailer, and accessory exhibit and demonstration, September 16 to 21, inclusive, can witness tractors operating hay balers, feed cutters, silo fillers, pumps, bean threshers, grain separators, harvesting machines, and pulling all kinds of tillage implements. They can get all the data they want about tractors and other exhibits from the exhibitors and from ranchers who have used these power farming machines. Men who have such machines will be there to learn the past year's developments. Those who have not yet invested will be there to find out whether power farming will pay them and which machinery pays best. There will be something doing all the time from 8 a. m. to 5 p. m., and dinner may be had on the grounds at city prices.

Among exhibitors additional to those mentioned in last week's issue will be:

The Killefer Manufacturing Company, who will show their Standard Subsoiler, Tractor Chisels, Orchard and Field Cultivators, Automatic Disc, and for the first time at any demonstration their Automatic Subsoiler.

The Samson Sales Company will have on exhibit their new model 30X. This model is equipped with Remy System of Ignition and Lights, Willard storage battery, and electrical controlled governor.

C. L. Best Gas Traction Company will show for the first time their new 60 H. P. Tracklayer; also their small 25 H. P.

The Holt Manufacturing Company will have their usual exhibit of the 40-75 H. P. and 22-45 H. P. with their full line of plows and land levers.

The Avery Company will show the following: 40-80 H. P., 18-36 H. P., 14-28 H. P., 8-16 six-cylinder new model, six-cylinder new model 5-10 H. P., new model cultivator, and the Avery Separator.

The A. F. George Co. will show Yuba tractors in sizes 12-20, 20-35, and 40-70; John Deere Tractor Moldboard and disc plows; John Deere Tractor disc harrows, John Deere packers and pulverizers, manure spreaders, corn binders, ensilage cutters operated by tractor, hay press operated by tractor, feed mill also operated by tractor, and many small tools will be included in this exhibit.

The Los Angeles Auto Tractor Co. will exhibit the Little Bear Tractor, especially adapted for orchard and small ranch work.

The Fageol Truck and Tractor Co. will exhibit their line of trucks and their latest improved tractor with walking wheels.

The Arnott & Company exhibit will include Superior grain drills, Sander's disc plows, Imperial Peg, disc and spring-tooth harrows and plows, Walter A. Wood's harvesting and tillage tools, Farquhar bean and grain threshers, American bean threshers and the Iron Age line manufactured by the American Bateman Manufacturing Company. This will be the first demonstration of the McKay disc plow on the Pacific Coast.

Washburn Bros. will demonstrate the Sandusky Tractor, Model D 10-20 and the Model E 15-35.

The Community Manufacturing Company, which is composed of local business men having a plant in West Alhambra, will offer for the first time at any Tractor Demonstration, the Allen Model A 10-20 Tractor. This tractor is suitable for orchard and ranchers of small acreage.

Smith Bros. will demonstrate the 12-20 Cleveland Track type.

The Douglas Boswell Company will demonstrate the Wallis 18-30 and 30-50 tractors and a full line of J. I. Case Plow Works implements

MOUNTAIN TRUCK LINE POPULAR.

There is a good deal of rough, narrow roadway with steep grades in western Nevada and eastern California. Motor trucking with big loads would seem a perilous undertaking.

A great deal of this territory, however, is served by the Ginocchio Bros.' truck lines, hauling supplies out to the ranches and produce back to Reno and other centers of business.

Four years ago the Railroad Commission granted L. G. Ginocchio a franchise to operate a freight truck between Reno and Gardnerville. His two-ton truck soon became swamped with business, making a round trip of 104 miles each day in seven hours of running time.

The opportunity was seized by Mr. Ginocchio's brother Jack, who bought a truck and got busy. They soon added four more trucks and extended their territory through Mono county, Cal. One of the trips is into the Yosemite Park, high above the Yosemite Valley, at Tioga Pass, reaching an elevation of 10,000 feet and descending over 6,000 feet in eight miles. On this trip, salt is hauled for cattle.

When goods are received, a way bill is made out, showing articles, value, from whom received, address, destination, weight, charges, etc., and space is left for signature of the party receiving the shipment.

Eggs on Air Only.

The Ginocchio boys tried hauling eggs into Reno, but because of rough roads, solid tires, and indifferent packing, so many eggs were broken that this line of business was found unprofitable. However, they put pneumatic tires on one of the trucks at a cost around \$200 per tire. Since then they have hauled eggs without having to pay for breakage. The pneumatic tires not only softened the bumps and made possible an additional \$900 worth of business in three months, but they seem to have been responsible for an increase in gas mileage from the average of 6½ miles per gallon with solid tires to 11 miles per gallon on pneumatics. The increased business more than paid for the tires in three months, during which the tires traveled 3,000 miles and were still but little worn.

ONE ON THE RABBIT.

"You seem to have lost your faith in a rabbit's foot."

"Well," replied Mr. Erastus Pinkley, "I done thought it over. An' de more I thought, de more I couldn't figure that the rabbit wat furnished de foot had been lucky for his ownself."

**Produced Cheapest by
LAYNE & BOWLER PUMPS**

Finest bronze bearings are used throughout in the construction of these pumps. Bearings float in a bath of oil protected from sand and water. No pit needed.

Types to meet all requirements—operate to any depth—capacities from 180 to 4,500 gallons per minute.

Ask for folder No. 25.

Layne & Bowler Corp.

900 Santa Fe Ave., Los Angeles

RAILWAY-AUTOMOBILE ACCIDENTS.

Automobile-railway accidents seem to indicate that the greater number of them are due to misjudging the speed of passenger trains, according to R. J. Clancy, assistant to the General Manager of the Southern Pacific, Western Pacific, and Tidewater Southern railways.

During the first six months of 1919, eighteen people were killed, 81 were injured, and 233 automobiles were damaged in grade crossing accidents. Of the 233 automobiles 111 attempted to cross in front of trains and were hit and 59 ran into trains. Thirty stalled on the crossings. Most of the accidents occurred in daytime. Most of them involved passenger trains.

In some instances drivers of automobiles raced with trains and were either struck on a crossing or ran into the train, evidently failing to realize that the speed of their machines, which seemed greater than that of the trains, was in reality considerably less. They did not consider the fact that a passenger train running at maximum permissible speed on an unrestricted track covers half a mile in three-fifths of a minute. They do not figure on the possibility that something may go wrong with motor or brakes at a tragical moment. They seem to think that they cannot afford to lose that three-fifths of a minute.

MORE WORK DONE WITH TRACTORS.

Forty-eight users of a certain 12-20 horsepower, tractor reported various performances which make interesting averages. The largest farm from which a report was received was 1,200 acres, the smallest was 30 acres and the average was 166.17 acres. Previous to purchasing the tractors the average number of acres plowed per day with horses was 2.44, ranging from one to five acres. With the tractors the average plowed per day was 6.89 acres, ranging from 4½ to ten. Five to fifteen acres had been harrowed per day with horses; but the tractors averaged 18.19 acres per day, ranging from ten to thirty-five.

In plowing with the tractors the average fuel used per acre was 1.9 gallons. With horses the average fuel used had been two or three square feeds per day per head.

OIL FOR DUSTLESS TRACTORS.

With a battery of tractors, whose working parts are completely enclosed from dust and which are equipped with water air-cleaners, an operator whom we know changes the oil about once a week, not because it gets the least bit gritty, but because by that time it wears out and does not have enough body to lubricate properly. Another operator of similar tractors in dusty summer orchard work relates the same experience.

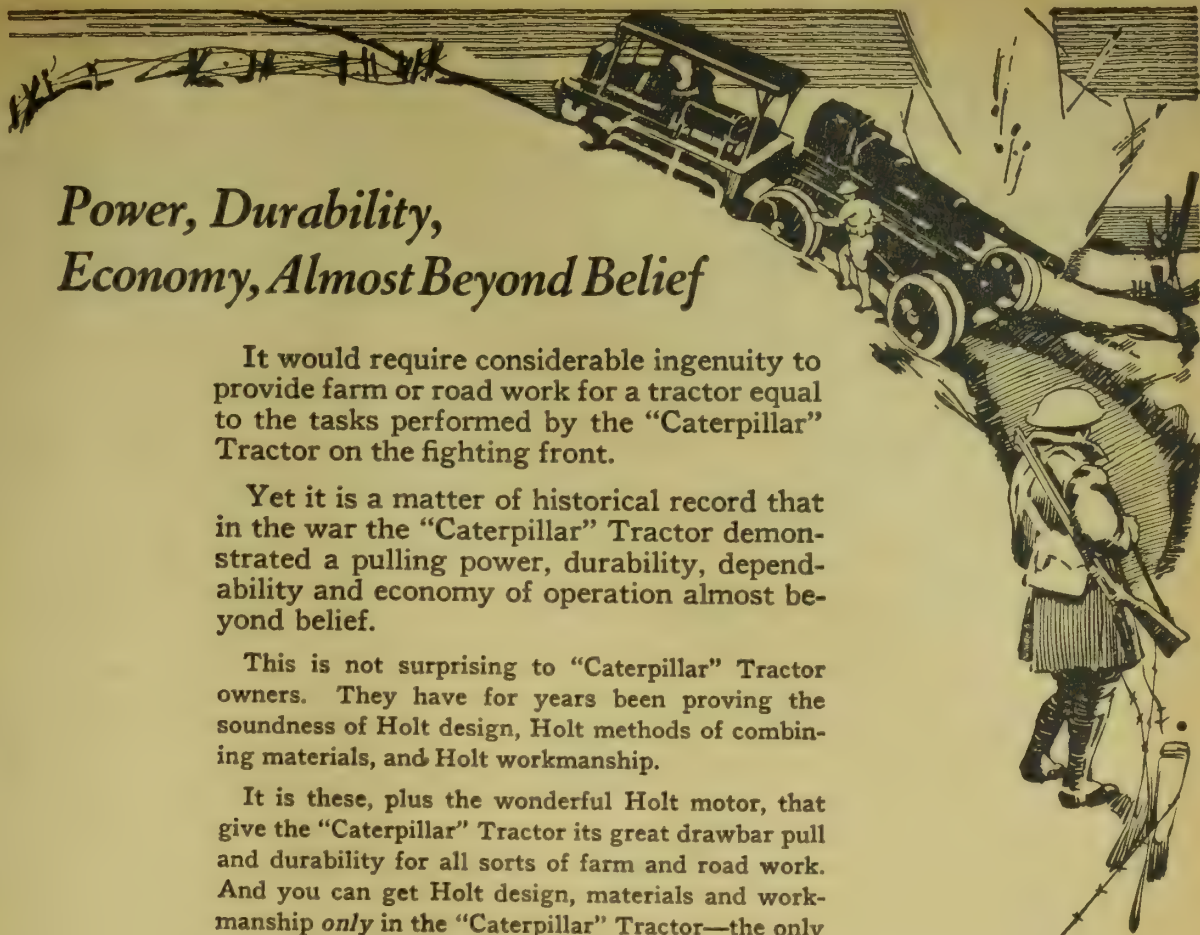

TRACTOR WORKED DAY AND NIGHT.

Purviance Bros. operated an 11-22 tractor two months practically 22 hours per day last winter. Most of the time lost was in oiling up and giving gas. They figure this was much cheaper than hiring all the men and horses that would have been required to do the same job within twice the same number of days.

COMBINED HARVESTER NOT FOR BUNDLES.

A big combined harvester tried to thresh grain put up in bundles with a binder. Its cylinders were too light and turned too slowly, so even the thresherman after a short time admitted that too much grain was going through with the straw. He pulled out and a stationary thresher finished the job.

A tractor operator, whose machine runs two miles per hour at plow speed, thinks he could do much better plowing at 2½ miles per hour, lighten the load, do as much work, and use no more fuel.

Power, Durability, Economy, Almost Beyond Belief

It would require considerable ingenuity to provide farm or road work for a tractor equal to the tasks performed by the "Caterpillar" Tractor on the fighting front.

Yet it is a matter of historical record that in the war the "Caterpillar" Tractor demonstrated a pulling power, durability, dependability and economy of operation almost beyond belief.

This is not surprising to "Caterpillar" Tractor owners. They have for years been proving the soundness of Holt design, Holt methods of combining materials, and Holt workmanship.

It is these, plus the wonderful Holt motor, that give the "Caterpillar" Tractor its great drawbar pull and durability for all sorts of farm and road work. And you can get Holt design, materials and workmanship *only* in the "Caterpillar" Tractor—the only tractor of the track-type used by the Allies in the great war—chosen and proved by severe and prolonged tests.

Get your "Caterpillar" Tractor now. Send for Catalog 403.

Pack Your Wheat Against Winter Killing

Not only is it necessary for you to have a perfectly prepared seed bed for your wheat for insuring the biggest yield, but you should pack it well against winter killing with this new light draft roller-bearing

Brillion King Team or Tractor Pulverizer

Just the kind of implement agricultural experiment stations have specified for mulching top soil for quicker seed sprouting and growth of young plant, and for packing the undersoil for holding the proper moisture for the most rapid future growth of plant and greatest possible crop yield. Strong durable. Price reasonable.

Grain feeds should be scattered in a deep, fresh litter, so as to induce exercise. This is very important.

Direct Drive Conserves Power in

12 H. P. on
Draw-Bar

25 H. P. on
Belt Pulley

THE
HUBER
Light Four

Draws three
bottoms

Turns an acre
an hour

TRACTOR economy and tractor power depend largely on the proportion of the power developed by the motor that is delivered to the draw-bar.

In simplicity and economy the direct spur gear drive of the Huber Light Four is unequalled. There are no bevel gears—simply a friction clutch and spur gear reduction to the driving wheels.

Other reasons why the Huber develops such large power in proportion to its weight are: the high wheels roll easier and afford a larger area of "traction grip"; center draft conserves power by avoiding "side pull"; high-grade extra strong materials reduce weight.

These features are the result of 20 years' development. They are behind the Huber reliability that has created thousands of satisfied Huber owners.

Write for "The Tractor in the Making". It tells the interesting history of tractor development.

Salt Lake City Ram Sale

(Written for Pacific Rural Press.)

Walter Priddy, shepherd for Bullard Bros., Rambouillet breeders of Woodland, does not think that the Salt Lake City ram sale of last week was quite equal to those of past years, either in number sold or prices realized. The dullness is attributed to the railroad strike, which had not been settled at that time.

Bullard topped the Rambouillet offerings in a great yearling for which Charles Kimble of Hanford paid \$1,450. It was freely predicted by many of those present that the same ram last year would have brought \$5,000. The first five stud rams sold for this figure averaged \$700. The highest price per head for a pen of range rams was paid when Whitehead of Del Rio, Texas, paid \$125 each for 26.

The highest average price paid for a pen of crossbreds was realized for a pen of Corriedale-Lincoln yearlings that brought \$80 per head. These were a very strong, firm-bodied lot with splendid fleeces.

James Merritt of Woodland paid \$350 for a Bullard ram and also bought 50 registered Rambouillet

ewes of Wood & Sons of Salim, Mich. Conaway Ranch, C. Harold Hopkins, Mgr., Woodland, bought a pen of six Hampshire imported yearling ewes that stood second at the royal show in England, for \$345 a piece. A very fine bunch. This ranch also purchased 25 Detwiler Hampshire ram lambs at \$45 a head.

Bissell & Brown of Dixon bought 85 Rambouillet yearling ewes, Miller & Lux 20 Rambouillet rams, and Kelleher a bunch of Hampshires.

Bullard Bros. are getting more and more into the registered Rambouillet game, as the tendency is setting strongly that way. They purchased a yearling Rambouillet ram from Wood & Sons of Salim, Mich., for \$850 and another of F. S. King Bros. Co., for \$400. Along with these five top-notch ewe lambs of Wood & Sons for \$102.50.

The top price of the sale was paid for a Hampshire yearling ram that brought \$1,600. Last year the top was \$3,000 paid by Bullard Bros. for a Rambouillet ram of Butterfield breeding, and was cheap at that, as he is a great ram from all view points.

Good Stock Celebration at State Fair

(Written for Pacific Rural Press.)

Just a glimpse of the livestock side of the State Fair indicates a great exhibit, although the railroad strike has prevented some from attending. The Guernsey herds of Edgemoor Farms at Santee, and the Elliott-Brant Ranch, Owensmouth, are missing, which cuts down that show to a great extent.

In the Poland-China classes John M. Bernstein and W. L. Haag & Son of Hanford are among the missing. M. Bassett & Son brought their hogs up from Hanford, 200 miles in trucks.

The Duroc-Jersey men are nearly all present, although some of them came from Southern California. The Diamond Bar Ranch, Spadra, near Pomona, are in the game with 35 head, and the Winsor Ranch of Bonita shipped to their exhibit by boat

from San Diego to San Francisco. The enterprise and determination to get to the Fair of such men as the Bassett's, Gatton and Walker, deserve commendation to say the least. Not but what many of the other breeders would do as well under the circumstances, but these fellows did it.

In the beef classes, as well as fat steers, there is a good showing. Entries are about even between Holsteins and Jerseys, while the Guernseys would have been strong but for the railway strike. Some extra good Ayrshires are also contending.

In the swine classes Durocs, Poland-Chinas, Berkshires and Hampshires are leaders in numbers, with the other breeds showing good individuals. Sheep are in the usual number, but more interest is being shown in them than in the past.

BELT SLIPS OFF VERTICAL PUMP PULLEY.

To the Editor: I am having trouble with the pulley and belt on my deep-well pump. The belt is six inches wide on a pulley seven inches in diameter with a 9½-inch face. When the belt is a little too tight it runs off at the top. When the belt is too loose, it runs off at the bottom. I have been told that if I had a crowned pulley larger in the middle than at the ends, I would not have that trouble.—H. S. A., Parlier.

With a vertical pump you ought to have a crown pulley. Even with it, a poor sort of belting will stretch during the hot day time and consequently sag to where it will drop off the under side of the pulley unless you have a flange on its lower edge.

We would suggest that if you wish to avoid loss of your own time and loss of pump time, the best belt you can buy will prove the cheapest. We believe that such belting will be able to do the work without falling off from a crown pulley.

In ordering the crown pulley be sure to state the size of shaft, or give the name and number of the pump.

Vertical pumps and their engines or motors ought to be on immovable foundations so there can be no relaxing of the belt by lessening of distance between centers of pulleys. It is quite generally accepted that there ought to be one-half inch drop per foot distance between centers of motor pulley and vertical pump pulley.

were so loose you could shake them like bones with your fingers as the operator found after removing the hand-hole plates. Still there was a chance to tighten them by removing shims.

"Work her till noon, and we will try to take up those bearings," said the boss. We did not wait to see what happened, but every hairsbreadth increase in space between the connecting rod bearings and the crankshaft gives several pounds harder blow on the crankshaft every time it turns over on every connecting rod that is loose. In a half-day's work, with such loose connecting rods, it may easily have happened that the bearings were so hammered out of shape and out of place that they could not be tightened with shims. Then the tractor would be laid up until new bearings could be secured or poured or new connecting rods put in. A shim in time saves the crop."

Forest Reserves in California carried 214,312 cattle during the last season and expect to graze even more during the next season. There are 21,156,392 acres of land in the United States Forest Reserves in California of which 118,938,909 acres are unpatented. The Forest Reserves are under control of the U. S. Government which charges from \$1 to \$1.40 per head for the season's grazing. Owners of sheep and cattle paid nearly \$1,750,000 for grazing permits on National Forests of the west during the last fiscal year.

LOOSE CONNECTING RODS.

It was distressful! The little tractor had been run 2½ months in dusty orchard cultivation, and not a working part had been adjusted. Its connecting rods were hammering and

The supreme court at Columbus, Ohio, last week upheld the recent seizure of fifteen tons of pork by the county prosecutor at Columbus in the fight against the high cost of living. This decision permits the sale of the meat to the public at cost.

UP NORTH

JERSEY COWS are adaptable to any climate. Hale in the North—hardy in the South.

Always efficient yielders of the richest quality milk—always dependable and gentle—always a pride to their owner.

JERSEYS

Jerseys consume less feed than any other breed. Every dollar you put into Jersey feed doubles its value in the milk pail. Her milk averages 5.37% butter fat. Butter and cheese made from Jersey Milk is the best obtainable. Let us mail you free some interesting data and information about the Jersey Breed.

THE FIRST DAY AT THE STATE FAIR.

The State Fair this year, has for the first time in its history produced an exhibition worthy of this production. This report only deals with the Agricultural and Horticultural exhibits contained in the great central agricultural building. The exhibits of fruit and produce as shown here have only been equalled at the World's Fair. In this building there is not an exhibit that is unworthy, the competition among the counties being very spirited—every booth having its own individual plan. Yet the whole, viewed from any angle upstairs shows like one great conception. The crowd at the opening day of the week was as great as comfort allowed notwithstanding the fact that the fleet was entering the bay that day. Among the counties that exhibited were Sacramento, Yolo, Kern, Glenn, San Joaquin, Fresno, Calaveras, Solano, San Luis Obispo, Placer, Los Angeles, Tehama, El Dorado, Humboldt, Alameda, Kings and Siskiyou.

The Growers Associations and Packers and Cannerymen had on hand some exhibits in keeping with the rest. Among them were the following: The California Packing Corporation, Rosenberg Bros., the Almond Growers (really a wonderful exhibit illustrative of what can be done with one product—just almonds). The California Raisin Association and the California Peach Growers had both fine booths of merchandise packs as had the Prune and Apricot Growers' Association and the Dairymen's Association.

Libby, McNeill & Libby and the Sperry Flour Co. both had good educational exhibits. The Phoenix Milling Co., Sego Milk and Westroback had fine booths with rest rooms, and Petroleum Products had a school in oils from the well to the bottle. Other educational exhibits were the Iron Canyon Irrigation Project in heroic topographical relief. A gilded topographical map of the Golden State and one of the State Exposition buildings. The State Library had a splendid exhibit, also the Board of Health.

The new Board of Agriculture had the best educational exhibit they have got together yet from the entomological and quarantine point of view.

The plum exhibit of M. Sharp of Vacaville, who has been doing a lot of work in development and experiment attracted much attention. The whole exhibition was the best by far that we have ever had. The new building and excellent stands for every exhibitor has brought forth response even up to the hopes of the Board.

In view of the fact that outside conditions threatened to delay delivery of some exhibits, it is really remarkable that everything was on the grounds on the opening day and most of it in place. The working arrangements as evolved by the Board constitute a fine system of organization where overlapping and confusion are reduced to a minimum. At any rate the public is not distracted with the sight of any directing hand—the machinery is hidden and runs smoothly.

A BIG SHOW IN PROSPECT.

Now that the premium list is out for the California International Livestock Show, to be held at San Francisco, Nov. 1 to 8 inclusive, intending exhibitors may learn the classifications, premiums and rules.

The premiums offered aggregate about \$35,000, besides extra money offered by several of the breed associations. Increases in cash prizes over last year have been made in the beef, dairy, sheep and swine classes. Entries close Oct. 1st. Poultry and rabbits will be specialized under separate superintendents, and the outlook is for big entries.

Last week the directors spent part of a day at the California building on the P. P. I. E. grounds and finally decided upon the erection of a big arena in the eastern part of the exhibit hall—the arena will be about 62x225 feet with a tan bark track. All the rest of the vast room will be given over to stock exhibits, while the old

The ACME Cutter

When a piece of steel is set in place, securely riveted and braced as in the frame of the Acme, it "stays put."

The frame cannot "settle" nor the boxes come out of alignment and cause hot barings.

Steel has made it possible to build the Acme lower so that it can easily be controlled while standing on the ground; to set the blower inside the frame, thereby strengthening that important part and to turn out a machine that is more generally efficient in every way and with a lower upkeep cost.

In other words, you will find the Acme to be the sturdiest, strongest built, most durable and dependable ensilage cutter you can buy.

PURE BRED JERSEYS AT PRIVATE SALE

The Jersey has proven the most economical producer of butterfat. Recent sales have demonstrated their popularity. When the Butler sale averaged \$3,367, a record for all breeds was established.

Now is the Time to Get Into Jerseys

My diversity of interests makes it advisable to dispose of my milking herd.

16 Cows and Heifers in milk.

7 fresh in August.

Mostly bred to UNULATA PRINCE 100172.

5 Yearling Heifers, open.

6 Cows are on R.-of-M. test and making splendid records.

The daughters of Undulata Prince are making splendid records at the fall, and are outstanding in the showing. I am retaining this year's crop of calves by him for the foundation of my future herd. At Sacramento in 1917, his get won: 1st prize, get of sire; 1st prize, produce of dam; 1st prize, young herd; 1st prize, calf herd; 1st prize, junior and senior calves and junior and senior yearling in the heifer classes; also junior and reserve grand champion.

In 1918 a daughter was second in the milking contest at Sacramento. His daughters on test are making up to 43 lbs. fat with first calves on ordinary farm care.

This is an opportunity to get into the Jersey business right.

IS A CALF WORTH 23 CENTS?

For 23 cents per animal you can insure your calves against loss from Blackleg by having them vaccinated with PURITY BLACKLEG AGGRESSIN (Germ-Free Vaccine made by the Kansas process). ONE TREATMENT immunizes calves for LIFE, and there is no danger of introducing blackleg into healthy herds. We also have PURITY ANTI-HOG CHOLERA SERUM, PURITY MIXED VACCINE for swine, and PURITY HEMORRHAGE SEPTICEMIA VACCINES for cattle and for sheep. For service that counts and does not end with selling, write, phone, or wire.

PURITY SERUM CO., J. L. Thatcher, Manager (Successor to Thatcher Serum Co.)
Riverside, Calif. Sacramento, Calif.

Along the Livestock Trail

(Written for Pacific Rural Press by Thos. F. McConnell.)

Picked Up in Southern California.

At Frampton Bros. Artesia, I found a combination of registered Holsteins, corn and alfalfa that would be hard to beat from any angle. The silage and the alfalfa feed the Holsteins and the Holsteins keep up the fertility of the land.

W. D. Millard, mayor of Arcadia, has a winning combination in Holsteins and Berkshires. He formerly raised thoroughbred horses, but finds his new venture more profitable.

Livestock is kept at the George Junior Republic, Chino, to educate and uplift the students, but Mr. Condee, the superintendent, believes it a wise policy to have the best, and registered Holsteins and Durocs are kept.

J. E. Wherrell of Fuimus Farms, Riverside, has only a small herd of Jerseys, but it certainly makes up in quality what it lacks in quantity. The average of 525 pounds of butterfat per year for the entire herd is one to be proud of.

E. R. Stalder of Nuevo Ranch, Riverside, says that by feeding his alfalfa to his registered Holsteins he realizes double what he would if he sold it off the place. Also he keeps fertility at home. Eight good cuttings of alfalfa is the yearly average. The Holstein herd is a great one and contains many cows of excellent breeding and with high records.

The plan of A. E. Harvey, manager of Fairbanks Ranch at Redlands, is to make market hogs of all Hampshires that do not come up to his standard of perfection. A local hotel uses the meat in preference to that of any other breed. Market hogs are kept on alfalfa from weaning time to about six months of age and are fed grain at the rate of 3 pounds to each 100 pounds of live weight. At the end of six months they are put on self-feeders for about 4 weeks when they are ready to turn in weighing from 230 to 250 pounds. Barley, kaffir corn and Indian corn are used for grain.

Geo. L. Lytle of Perris is another Southern California Hampshire breeder who keeps his hogs in excellent condition and has many fine individuals. Self-feeders are used for young stock and market hogs.

Sterling Smith has started a Duroc breeding farm at La Mesa, San Diego county, his idea being to raise hogs among his lemon trees because the lemons are not any too sure a paying proposition. His foundation animals are strong in the blood lines of Orion Cherry King, Pathfinder and the Colonels. This ought to beat the lemon game.

Preston School Sale of Ayrshires.

Ayrshires are fast coming to the front in California. Only a few weeks ago several carloads of very high-class animals were shipped into the state from Canada and the east, part going to found a new herd and part to strengthen a well-established herd.

Up to this time it has been almost impossible to purchase good animals

of the breed here at home, but the announcement is made that the Preston School of Industry, at Ione will disperse its entire herd in a public sale to be held at the State Fair Grounds, Sacramento, September 16. The herd consists of 60 cows, heifers and bulls, and was established with animals selected from some of the best known herds in America. The sale offers an excellent opportunity for the purchase of foundation stock.

Hampshires at Gardena.

Tom M. Bodger of Gardena is one of the wide-awake Hampshire breeders of Southern California, and while his herd is not as large as some, he has by good business methods sold practically everything he has raised himself and all that those of his neighbors who breed registered Hampshires have raised as well. Good business methods and the best of stock account for this.

Mr. Bodger breeds many sows for neighbors who have no boars. He has a special trailer for hauling hogs with floor only a few inches from the ground, which makes it very easy to load the animals. If a patron has a sow he wishes bred he calls up Mr. Bodger, who calls for and returns the sow. By doing this the service fees average about \$35 weekly the year through.

Rough's Greenfields.

It is supposed by many that Poland-Chinas are the only blue-blooded animals raised by W. H. Rough at Arlington Station, Riverside, but he has a great registered Jersey herd in the making. A senior herd sire of Merry Maiden blood and a grand youngster of Financial King breeding from Eastmont Farm, is evidence that Mr. Rough knows what he is doing.

In the swine department the great herd sire, Superba, although 6½ years old, is almost a show boar yet. He has good feet and legs and is very strong and active. His progeny are very much in evidence in the pens and prove him to be as great as a breeder as he was as a show boar.

Falfadale Farm Fancies.

B. H. Wilkinson, manager of the swine department of Falfadale Farm at Perris, recently sold the senior herd sire to Winsor Ranch and had to build a crate 8 feet long, 4 feet high and 30 inches wide to hold him. He weighed 965 pounds and is a sample of the kind of Durocs raised at Falfadale Farm. The boar has sired many excellent gilts that have been retained in the herd. They are of the fashionable type and are busters for size.

This is one of the ranches where all of the feed used is raised and ground at home. The cost is reduced to the minimum and quality is assured. This year 55 acres of milo have been planted to alternate with barley for variety. Tankage is used as a supplement to the grain, and the way hogs grow at this ranch shows that the feeding system is about right.

Another Gentle Bull Gone Bad

Several times we have related instances of the perfectly gentle bull suddenly turning mean and injuring or killing his keeper. The latest report credits two more fractured ribs, a general shaking up, a bad scare, a \$50 doctor bill and other minor items to the "gentle bull."

This particular bull heads the Holstein herd of W. J. Erdman. He has been a perfectly nice, gentle, well-behaved bull from the day he was born until June 28th, 1919, said date being in the third year of his life.

Like many other "gentle" bulls, he has been allowed to run at large with the herd. He has been chased around the lot by the boys; in short, he has enjoyed the fullest confidence of a trusting family.

On June 28th, while being driven home with the cows at eventide, bullshy tendencies suddenly became manifest in the gentle creature. Deft-

ly inserting a left horn among the right ribs of Mr. Erdman, he aviated him for a considerable distance. It is not hard to guess what further he would have done to Mr. Erdman, had not the two Erdman boys appeared with pitch forks and sufficient enthusiasm to persuade their trusted bovine to beat it with the cows.

All those among us who have too long trusted some "gentle" bull and lived to tell about it, can sympathize with Mr. Erdman. In his rude awakening we have for him a fellow feeling too strong to permit of even a camouflaged. "I told you so." For to trust our "gentle" bull is human; to trust him further because some impertinent nobody advised against it is also human; and not until the "gentle" bull pitches him toward Kingdom Come will the average man among us agree that bull nature is as inevitable as human nature and a darn sight more sudden.

Feed Her and She'll Feed You

Silos have been a necessity ever since farming and dairying have been regarded as profitable businesses. Yet it has taken years for the farmer to recognize this. During the last few years he has come to know that it is an indispensable asset.

Today he wouldn't be without it. It increases his dairy production, lessens his feed bill and preserves the full food value of his crops. The Simplex Silo has done more toward causing this awakening than any other make. It is more practical and efficient. It is the last word in up-to-date feeding methods and a life-time land mark.

The Simplex Silo

is built of Oregon Pine Clear 2x6 Tongue and Groove Staves running full length the height of the silo. No end joints to leak and cause spoiled silage. With the CRISELL TANGENT TOP, which keeps the silo in a true circle, in conjunction with diagonal cable bracing to the foundation, the SIMPLEX stands in its original shape under all conditions. Doors are heavy, air-tight, two-way type—hinge or lift.

SANTA FE LUMBER COMPANY,
16 California St., San Francisco, Cal.

Please send me folder describing Simplex Silos; also information about Papec Ensilage Cutters.

Name

Address

The Simplex Silo is guaranteed. Money back if it doesn't meet our claims. Write for additional literature and blue prints. Increase your dairy profits by erecting a Simplex. Write today.

Own a Papec Cutter

The "PAPEC CUTTER" is built in the largest exclusive cutter factory in the world. It is the lightest running, cleanest cutting machine made. It operates with the smallest power and has the largest capacity.

"PAPEC" construction is simple, compact and rigid. Cutter knives and blower fans are attached to same wheel which revolves at low speed—600 to 700 revolutions per minute. It "throws and blows" evenly cut silage to the top of the highest silo.

The PAPEC is guaranteed. Write for circulars.

November 3-7—Western Royal Livestock Show, Spokane.

November 9-14—Northwest Livestock Association, Lewiston.

November 17-22—Pacific International Livestock Exposition, Portland.

The Dairy.

In our issue of Aug. 23 we published the record of Bell Faskie De Kol Withop, a junior two-year-old in the Holstein herd of E. E. Freeman of Modesto, 19.1 lbs. butter, eight months after calving. This should have been 13.1 pounds. The latter record, according to Prof. Woll, is probably the state record for a junior two-year-old eight months after calving.

J. P. Phillips has returned from Minnesota, where he purchased two carloads of Holstein heifers and now has them at his place near Fresno. The stock is of the Pietertje Ormsby strain and Mr. Phillips expects to get the prize money at the Fresno Fair, where they will be shown first.

Swine and Swinememen.

Mrs. Hardy of the Anchorage Farm, Orland, offers a solid silver trophy for the best all-around exhibit from a high school at the coming Orland fair.

Recent sales reported by Harvey M. Berglund of Dixon are as follows: One yearling boar to J. D. Rowe and Son, Davis, to be used as a herd boar; one bred gilt to H. C. Biggs, Dixon.

Young & Clark of Lodi, the well-known Poland China breeders, have a pig out of Bobs Smooth Model and Golden State King that gained 22 pounds in 7 days. This is a very strong smooth gilt and promises to be a wonderful sow. Her dam will be in the Lodi Sale of September 19th.

Entries for the Fourth Annual National Swine Show and Exposition to be held at Des Moines, Iowa, September 29-October 4th, inclusive, close on September 13th. No entries accepted unless mailed on or before closing date. A fee of \$1 per head is charged for each animal exhibited and is due when entries are made.

Robert K. Walker of Winsor has been elected president of the Western Duroc-Jersey Breeders' Association. V. F. Dolcini of Davis will be the association's new vice-president, and S. E. Whiting of Sacramento will be secretary-treasurer. Members of the association are planning for a promotion sale of hogs January 14.

F. C. Dollard of San Francisco, a hustling young man with a love for "the out of door" life is staying with Les McCracken and helping out with his Waukeen Poland-China herd in getting ready for the McCracken-Marsh Poland-China sale at Modesto on October 4th. Mr. Dollard expects to start in the swine raising business for himself in the near future.

Hogs declined heavily in Chicago the past week. The price per cwt. dropping \$3.00 in three days, and on August 29th, the price was \$5.00 lower than the record of July 31. The packers say the decline is due to light buying by the public of high priced fresh meats, and a consequent disinclination on the packers' part to slaughter heavily in face of such a market.

R. J. Merrill & Son, Morgan Hill, proprietors of the Imperial Stock Farm, believe in getting the very best sires possible. A demonstration of this is their purchase at the Carruthers' Farms sale the great sire Live Oak Champion for \$425. This boar will be used on a wonderful bunch of gilts out of their Forest Grove Laurel sow and sired by Winona Champion 13th. These gilts are as good a lot as any found anywhere and pigs from them and Live Oak Champion should be world beaters. The Merrills are certainly coming to the front as Berkshire breeders.

The San Joaquin County Poland China Breeders' Association are a bunch of "live wires" and are leaving nothing undone to make their coming boar and gilt sale of September 19th a success. Individually and collectively everything is being looked after and done. When something comes up that requires the combined efforts of several, provision is made at one of their meetings for its accomplishment by several combining and doing the work rather than depending on hiring it done. Such effort, with the high class of the animals consigned, indicate excellent results at the sale.

Some people never want to do anything except they do it on a large scale, but often the small beginning leads to great success. John Bernstein of Hanford, has gotten a statewide reputation as one of the best Poland-China breeders and it has been accomplished with one great boar, the President, and two or three first class sows like Fruitful Maid. He has always given his customers their money's worth. Of course that seems to be a characteristic of the breeders about Hanford anyway, but John Bernstein is a good example to go by anywhere and means to keep up his own and Hanford's reputation in his more extended operations in the Poland-China business.

Beef Cattle.

We often hear breeders of live manager say, "If I had a whole herd I take them to the fair." They seem to realize that one or two ones in the pink of condition are

Calf Profits

Are you getting them? Calf profits mean more to you now than ever before.

Blatchford's Calf Meal

has been known since the year 1900 as the sum-

pt. milk substitute. Costs less than half as much as milk - prevents scouring - promotes early milk.

See actual figures show how to increase your calf profits.

Write for New Data COULSON CO. - Petaluma

pect for silage, as 30 acres of as nice Indian corn as ever grew anywhere is just ready for harvest and they have been working at it this week. Much of the corn is 15 feet high and well eared. This corn was grown without a drop of water after planting, either rainfall or irrigation, but did have plenty of cultivation and the land on which it is grown is naturally fertile. Such feed fed to Ormondale Short-horns cannot help but produce the high-class stock always found at this great breeding establishment.

The Palo Alto Stock Farm reports the feed on their range as excellent, and their 1100 grade Shorthorns in excellent condition. These cattle while classed as grades are in reality pure breeds, as they are the descendants of an importation of pure Scotch Shorthorns made by Senator Stanford years ago. Nothing but registered Shorthorn bulls have ever been used in the herd. They are, therefore, pure breeds but cannot be sold as such, but the owners have the advantage of having the easy feeding qualities making for very early maturity and uniformity found in such stock.

W. M. Carruthers announces that he is about to move back to his Mayfield ranch and keep it as a permanent breeding and sales farm, retaining the Live Oak farm as a breeding establishment. Stock to be moved include ten of the top cows, 12 of the best heifers, 22 bulls and a great herd of Berkshires, better than any he has had before, which is saying all that it is possible to say in that respect. This will make the Shorthorns much stronger in the Peninsular and coast region close to San Francisco, as there are already the herds of Ormondale, Pacheco Cattle Co., T. T. Miller, and only a little further away the San Julian Rancho of the Dibble Estate, and S. J. Lowe of San Luis Obispo.

Livestock Miscellaneous.

Two Uruguay cattle men are in the U. S. buying purebred cattle to help stock their ranches in South America.

The exportation of wool from Australia to the United States will become possible after June 30, 1920, when the central wool committee, which has controlled the output of the commodity for the British Government, ceases its activities.

Dr. J. P. Iverson, chief of the Bureau of Animal Industry of the State Department of Agriculture, says that stock men need not be worried because of reports of outbreaks of anthrax in Mono county, as the disease situation is well in hand. The situation in Glenn, Colusa, Butte and Sutter counties is not serious and the disease does not appear to have made as serious inroads as it did last year.

CHANGE OF FIRM NAME.

The big irrigation concern of Kellar-Thomason Co., of Los Angeles, originators of the valve system of irrigation, announces a change of name to the Martin Iron Works. Several years ago the management of the company was taken over by Geo. C. Martin, from whom the new concern derives its name.

Is This the Way You Feed Your Hogs?

(Written for Pacific Rural Press.)

Corn is, of course, the basis of most of the pork production in the United States. It will grow in California, but barley can be grown at about one-third the labor cost per 100 pounds yield, for it is harvested in a single operation by the combined harvesters, says Prof. J. I. Thompson, of the University Farm, Davis, in the Poland-China Journal.

Quite naturally then, barley is the basis of our pork production. On irrigated ranches it is becoming quite a common habit to grow a crop of milo maize following a crop of barley. A considerable amount of this latter crop is also grown between rows of young trees, and also on newly broken alfalfa land where barley may grow too rank.

The supplementary feeds used with these two cereals may be skim-milk, tankage, fish meal, linseed meal or coconut meal.

A considerable number of market hogs are grown or fattened on various by-products of the ranches, such as barley or wheat left on the ground after harvesting—and this amount is sometimes very considerable—dried grapes and raisins, spoiled or wormy fruit and "windfalls," beans, rice, beet tops, etc. In fact, I doubt if there is any other area where hogs are used so extensively to salvage so much material which would otherwise be wasted. The first list, however, includes the basic feeds most commonly used in pure-bred herds, except mill by-products, such as wheat and rice middlings.

Each year finds an increasingly greater percentage of the pure-bred hogs running on alfalfa pasture. The long growing season of at least nine

months in most of the hog-growing sections, the enormous yield of at least 7 to 10 tons of this feed on a hay basis, and the high protein and ash content make it an almost ideal hog pasture. The majority of high-class hogs now growing are likely to be found grazing on alfalfa, and receiving a daily ration of barley or milo, with skim-milk or tankage. Such a ration is almost an ideal one for the production of either market or breeding animals.

Some breeders use oats as a part of the ration for breeding animals, but these are not so necessary with barley as with corn, for the greater bulkiness of the barley compared with corn is a reasonable safeguard against an over-supply of carbohydrate material.

Smooth hogs with ample bone to carry them readily, are easier to produce here than in the Cornbelt. In fact hogs with too light bone for their size are the exception.

It would be difficult to secure the same rate of gains here as in the Cornbelt because of a bulkier ration, were it not for the excellent climatic conditions. Fall pigs grow as rapidly as spring pigs, and even in the hottest weather the nights are cool, so that the rate of gain can be just as high here as elsewhere. The barrows shown by this institution at the last International at Chicago were just as heavy for their age as the largest of the entries in the same classes.

Average rations here are about as much too narrow as the average Cornbelt rations are too wide, but this abundance of protein tends to produce a much smoother animal than is produced with an excess of carbohydrate or fat-forming material.

More to Sheep than Wool and Mutton

(Written for Pacific Rural Press.)

The inedible by-products of the sheep are more valuable than those of either the steer or hog, considering their proportion to the carcass, according to Armour & Company.

Sheep pelts, of course, come first in value. This includes the wool, which is valued not only for its fineness, but also for the length. Sheep skin is more generally used in shoes—almost as much as calf. Chamois skins are today entirely made of sheep skin. The leather is used for bookbinding exclusively, for gloves, hatbands, suitcases, and a wide range of other articles.

In wool houses the full length of the wool is saved by taking it out, roots and all, by means of chemicals instead of shearing. This wool is hand sorted, according to length, fineness and color, into more than fifty grades. It is then scoured to remove dirt and grease, after which it is dried, baled and sold as "scoured pulled wool" direct to manufacturers.

In the process of scouring, lanolin is obtained. This is a fatty substance largely used in face creams and ointments because of its soothing effect on the skin.

Musical strings, clock cord and surgical ligature for sewing up wounds, as well as casings for little sausages, are made from the intestines of the sheep. There is no such thing as catgut violin string, that being merely an arbitrary name for the product of the sheep.

Suprarenalin, the active principle of the suprarenal gland, just above the kidney, is extensively used as medicine. More than 130,000 sheep are required to make a pound. Pancreatin, another medicine, is made from the pancreatic gland, and still another from the mammary glands. The thyroid gland (seat of goitre in humans) yields an important medicinal product.

A class of oleo oil is made from the better grade of mutton tallow, and enters into the manufacture of oleomargarine.

Inedible greases are used in soaps. An important by-product of soap-making is glycerine and other explosives and war munitions. The blood, dried and ground, makes calf feed and

fertilizer. Hide trimmings make glue. Bones and other waste make tangale and fertilizer.

RURAL PRESS HELP IS TIMELY.

"A good word for the Pacific Rural Press comes from Mrs. A. J. Beckett of Richland, who said, in substance, "When I came out here to my place and went to work with everything to learn, it seemed that each Press that came along had, just the help I most needed that week."

Do This For Your Hogs

Provide a wallow close to the feeding grounds to which add Dr. Hess Dip and Disinfectant. The DIP will kill the lice and cleanse the skin, and as the hogs pass back and forth from the wallow to the feed trough, the DRIP will destroy the disease germs and the worms that pollute the ground. That will mean a clean, healthy skin, freedom from lice, a safeguard against disease and larger, better porkers. Also sprinkle freely about poultry houses, pens and stables to destroy germs and avoid contagious diseases. An excellent disinfectant for the home.

Dr. HESS & CLARK

DR. HESS DIP and DISINFECTANT

GOOD HOUSING INCREASES HOG PROFITS.

More hogs are grown for market on farms than any other animals, and because of their importance as money-makers one might expect to find them the best housed of all animals. Instead, the opposite is usually the case. Why the hog so often is not properly cared for is hard to say. Perhaps it is due to the old-time notion that "anything is good enough for a hog." Yet there is no animal on the farm which will respond better to good protection and care. There is no animal which requires better protection from the cold; none for which a good bed is more necessary, and none so much in need of sunshine as the little pig. The horse and the cow have good coats of hair and even a calf or a colt when left in the cold is provided with a good fur coat. The hen's feathers are the best of protection against cold, but piggy wiggle has almost nothing between his skin and the weather.

One of the first requisites for success with hogs is proper shelter, and the Jamesway Hog Barn Book, which has just come to our desk, shows that the James Manufacturing Company, so well known for its dairy equipment, has solved the problem. This book of nearly a hundred pages of valuable information contains many illustrations and shows not only ideal hog houses, but proper equipment. The De Laval Separator Company, 61 Beale Street, San Francisco, has the agency for this great line and will be glad to send a copy of the Hog Barn Book upon request.

FRESNO DISTRICT DUROC BREEDERS ORGANIZE.

Fourteen Duroc-Jersey breeders of Fresno and Madera counties, owning more than 500 registered hogs, recently formed the Fresno District Duroc-Jersey Swine Breeders' Association, with J. Walter Schmitz of Madera president; H. E. Spires of Caruthers, vice-president; H. H. Brereton of Sanger, secretary-treasurer, and C. J. McClure of Fresno and Chas. Hubbard of Riverdale, directors.

The purposes of the new organization are to hold public sales of registered stock, to prevent any illegitimate operations or misrepresentations, to combine for discussing the problems peculiar to Duroc breeders, and to encourage the production and purchase of this breed of swine.

The association was organized after a thorough discussion of the subject by prominent bankers and stockmen, including H. C. Carr of the First National Bank of Porterville, T. F. Saunders of the Bank of Italy, B. J. Sheagren of the Bank and Trust Company of Central California, T. E. Osterhaut of the Bank of Madera, J. W. Masten, Fresno county pig club leader, and Allen Thompson and R. C. Sturgeon of the Tulare County Association.

The association has almost unlimited opportunities for breed promotion work. Long may it live and flourish.

PROFITABLE POLANDS AT BERNSTEIN-HAAG SALE.

Why has John M. Bernstein always made such high averages at the Hanford Poland-China sales? Largely because he has consigned daughters of President—the wonderful breeding boar, whose offspring is in such great demand. Mr. Bernstein will offer some of his daughters at the Bernstein-Haag sale to be held at Hanford, Wednesday, September 17; also several of those classy gilts that he brought out from the Corn Belt a few months ago. Many of them will be bred to the sensational boar, The Yankee, Jr., and some to President.

The W. L. Haag & Son offering will include a large number of daughters of the great sire, Young Jumbo, a grandson of Long Jumbo, whose son recently sold for \$18,000. Many of the sows and gilts will be bred to Lendorris Liberty Bond, son of Liberty Bond, for whom \$10,000 was refused.

We are talking in big figures now, and it shows the quality of stock that will be offered at this sale.

Calco products for every farm

CALCO PRODUCTS are made of all metal construction—built of Armco Iron and Cast Iron. Every piece is rigidly made, strong, durable, sanitary—built to give long service.

The Calco Stock Water Trough is made for cattle and horses. Built ready to go on supporting frame. Capacities from 18 to 153 gallons—right prices.

Calco Hog Troughs—for healthy hogs—are made in sizes from 24 to 120 inches in length. Armco Iron and Cast Iron construction throughout. Safe, clean, durable.

Calco Sheep Troughs—are made for sheep, deep troughs in capacities from 51 to 131 gallons. Ready to go on supporting frame.

Calco Automatic Hog Watering Fountains give constant supply of fresh water. Clean, durable and give long service. Illustrated Fountain (Stock number 751), diameter 44 inches.

Calco Automatic Hog Grain Feeders are made in capacities from 2 to 14 bushels. Give automatic supply of clean, fresh grain. No waste. Long service.

These products are profit-producing, long service, all-metal farm necessities.

Live Stock Queries and Replies

Cows Don't Have Glanders.

To the Editor: We have a cow with hard lumps about as big as your fist in each flank and one in one quarter of her udder. A butcher says it is glanders. Do cattle have glanders?—B. I. G., Tulare.

(Answered by Dr. E. J. Creely, San Francisco.)

Cattle are positively immune from glanders and you need not have any worry on that score. I am quite certain that your cow has tuberculosis and that a test will reveal its presence. You should have her tested at once, and if she reacts and seems to be a carrier, it will pay you to get her out of your herd.

Coconut Meal For Hogs.

To the Editor: Is coconut meal good for hogs, and if so, in what quantity?—E. S. T., Fresno.

(Answered by the Livestock Editor.)

Experiments to determine the value of coconut meal have recently been carried on at the Oregon Agricultural College. It has been tried in varying proportions and other things being equal, it will be found that 75 barley and 25 per cent coconut meal makes an excellent

feed. There are two kinds of coconut meal—home grown and oriental. The latter is low in protein and extremely high in fat, running as high as 40 per cent. Evidently, coconut meal varies considerably, as hogs relish some lots and do not eat other lots readily. If it is necessary to keep a supply of coconut meal for some time put it in a cool dry place, for heat or dampness will make it rancid.

Selling Meat To Neighbors.

To the Editor: Can I butcher my own stock and sell the meat to others without taking a license?—J. T., Modesto.

If you butcher some of your own stock for your own use and have meat left over, you are privileged to sell it to your neighbors without taking out a license. But if you kill several animals at a time, or buy animals outside of your own herd to kill and sell the meat to outsiders, you will then be considered a butcher and will have to secure a license. The laws are so framed as to permit a farmer to sell the meat that he cannot use himself whenever he kills an animal, but not

to allow him to enter into competition with butchers.

Bad Results From Cold In Horse.

To the Editor: When working my horse would get so leg wearied every afternoon that it would be almost impossible to get him to travel, but he would eat fairly well. After a time I stopped working him and in about 24 hours the skin thickened to about twice its normal thickness and the horse lost flesh rapidly, soon being nothing but a rack of bones. His legs swelled to almost double their normal size and his mouth and lips swelled up until he could hardly eat. Please diagnose the case and prescribe treatment.—W. T. Turlock.

(Answered by Dr. E. J. Creely, San Francisco.)

Your horse has purpura hemorrhagica-anasarca, probably caused from a slight cold contracted about 3 weeks previously. It may, however, be caused by any debilitating disease and it is often fatal. For treatment, apply creoline, one part; cottonseed oil, 20 parts to swellings and give one ounce chlorate potash 3 times daily in the drinking water. Subcutaneous injections of Western Laboratories leucocytic extract, once daily, have effected many cures.

Sow Overfed.

To the Editor: One of my brood sows farrowed 12 pigs, but killed 3 at farrowing time. Now the udder is caked and the pigs cannot nurse. What can I do? We have been feeding bran and mill run and dry alfalfa hay.—J. H. C., Corcoran.

(Answered by the Livestock Editor.)

You do not say in what quantities you feed your sow, but evidently she was fed too heavily at farrowing time. A sow should not have anything for from 24 to 48 hours, except a little water with not more than a handful or two of bran in it. After that time you should begin feeding her just a little and not bring her to full feed until 10 days or two weeks after the pigs are born. If a sow is fed heavily from the start she will develop more milk than the pigs can take and this will cause such udder troubles as you mention. Cut down on the sow's feed at once and see that she gets laxative feeds, such as bran. Get some camphorated oil or mel' camphor and lard and rub on the udder, massaging as much as the sow will allow. It may be necessary for you to use hot applications first. If possible give the sow some green alfalfa or other green feed instead of the dry alfalfa hay.

PREMIUM LIST FOR LOS ANGELES SHOW READY.

The premium list for the second annual Los Angeles show is convincing proof that the directors are sparing no effort to make the display one that will reflect the very best in every phase of the farm stock industry. The premiums total \$35,000 and every inducement is made to attract breeders of dairy cattle, beef cattle, hogs, sheep, draft horses, saddle horses, mules, jacks, ponies, goats, poultry, pigeons and rabbits.

Entries close September 20. Don't wait until the last minute. Send for a copy of the premium list to C. R. Thomas, manager, Chamber of Commerce, Los Angeles, and get your entries in early.

A carload of wool shipped to Boston through the Farm Bureau Farmers' Union wool pool, has been sold in Boston at 60 cents per pound for the best wool in the lot. The wool was shipped early in July at an advance payment of 30 cents per pound. The amount should net the farmers well over 50c. per pound, which is very good as compared with the 35 or 40 cents that local buyers would have paid.

Premiums aggregating \$42,225, with many silver trophies and other awards in addition are announced for the ninth annual Pacific International Live Stock Exposition, to be held at Portland, November 17 to 22, in a preliminary classification list issued by the secretary.

Poultry and Rabbits for Profit

LOOK OUT FOR LIMBERNECK.

Of all summer diseases of poultry, limberneck is one of the most common—especially of farm flocks that are given free range and can pick up food at will. Strictly speaking, limberneck is not a disease, but a symptom of a diseased condition which is characterized by a paralysis of the muscles of the neck.

The bird practically loses all control of the neck muscles, and stands or squats with its neck limp. The crown of the head rests on the ground between the feet, and usually it is impossible for the bird to raise its head from the ground. Sometimes this can be done with great effort, but the head still hangs downward with the neck arched in a peculiar fashion like an inverted U. Occasionally a different symptom will manifest itself and the bird will have a "wry neck," which is a twisting backward of the head and neck upon the body, the head sometimes being turned almost entirely around.

Either condition is due to the absorption of poisons from the intestines, which act upon the nervous system and cause paralysis. The trouble is generally associated with indigestion or intestinal worms, or the eating of moldy grain or putrid meat with farm flocks on free range, most of the attacks are due to the birds getting access to carrion flesh of some type—probably dead animals which have not been burned or buried and have become decomposed. Beef scraps not properly cured may be responsible, and if no other cause can be discovered they should be tested out by scalding a small quantity with boiling water. If it gives off an offensive, putrid odor, the scraps are not fit to feed and should be replaced by a better grade of sweet, wholesome scraps.

When an attack occurs, search carefully for the cause and remove it to prevent further occurrences. Separate the affected birds, keep them warm and quiet, and give each a full dose of purgative medicine—a teaspoon of epsom salts, or a tablespoon of castor oil or olive oil, or medicine you have on hand, that will contract the poison and assist in throwing it off. White of egg, milk or a mucilaginous drink of flaxseed tea are good antidotes for poisoning.

Usually birds will show signs of improvement in from 10 to 24 hours and will be ready to go back to a regular food ration, but feed lightly for a few days. A little thoroughly cooked rice, lightly seasoned with salt, is good to feed at first. Limit the dry grain and beef scraps, and feed liberally of green stuffs.

A cure is impossible in some cases, and if a bird is no better after three or four days it is not advisable to keep it. Use the axe, and either burn the bird or bury it deep.

BUILDING PIGEON HOUSES.

The essentials of a pigeon house are fresh air, dryness, good drainage, sunlight and space enough for the comfort of the pigeons.

A southern or southeastern exposure is best. Care should be taken to construct a house that cannot easily become infested with rats, and it is best to leave space under the house into which cats and dogs can go for rats without being able to get the pigeons. This is usually accomplished by building the house 12 to 24 inches above the ground and boarding up the space between the ground and the floor, but leaving small doors for the cats and dogs. The house should be tightly constructed on all sides to prevent any drafts. While more open and less expensive houses may be built in warm sections the house must be comfortable in cold weather. The squabs produced in winter may be increased somewhat by heating the pigeon house, but this does not pay under average conditions. Sunlight is essential.

Windows should make up about one-tenth of the front of the house

and be so arranged that they can be taken out during the warm weather. One window in each pen may be replaced by muslin curtains for ventilation in cold weather. The windows should be placed just below the eaves to allow the sun to shine well back into the house.

A gable roof building 10 to 15 feet wide, 6 feet from the floor to the eaves, and 8 to 9 feet to the ridge, makes a good pigeon house. A pen 8 by 9 feet will accommodate 25 pairs of pigeons, while 40 pairs may be kept in a pen 8 x 13 feet. The necessary floor space to allow per pair varies from 2½ to 3 square feet, according to the size of the pen, as a pair of birds require less floor space in large than in small pens. From 20 to 75 pairs of pigeons may be kept to a advantage in each pen.

CROP-BOUND TURKEY.

To the Editor: Will you kindly tell me if there is any cure for turkeys with enlarged crop (or crop). It hangs down and greatly hinders locomotion in some cases. I have four young ones so afflicted. Would it require an operation, and would it be safe for a novice to perform it?—Subscriber, Angiola, Calif.

It is evident that these fowls have been "crop-bound," but they did not die for the reason that the crops either stretched and became permanently enlarged, or the interior was ruptured. To remedy this trouble, pluck the feathers from one side of the crop where it joins the body and cut an incision with a blunt-pointed scissors. Cut through both the skin and the inner crop. Cut away quite a piece of the membrane of the inner crop and remove all food and other contents. In sewing up the openings be sure to sew the crop and skin separately. Feed lightly for a week, and when healed remove such threads as are in sight. Cut at the side and not at the bottom of the crop and skin, otherwise the liquids may leak away as fast as the fowl drinks.

FEEDING RABBITS FOR RAPID GROWTH.

We recently heard of a case where a rabbit breeder sold two young Flemish does for \$100. They were only 4 months old but weighed 11½ pounds each. Feed had a great deal to do with this marvelous growth and the ration fed was as follows: Morning, mash consisting of 4 parts beet pulp; 4 parts bran; 1 part alfalfa meal; 1 part barley meal; 1 part water. Evening; whole oats, alfalfa hay, water. Carrots twice a week in the morning. Also occasionally dandelion and celery. To nursing mothers, same ration but extra meal of bread and milk with a little lime water added at noon, and oatmeal substituted for whole oats.

DON'T STOCK UP HEAVILY WITH GRAIN.

We have received several inquiries from poultrymen asking if it is advisable to buy heavily at present. Conditions are rather panicky in feeds and grains of all kinds and no man can tell what the next day may bring forth. Experts are gambling on lower grains and feeds in the near

future. December milo is quoted at \$3.07½ in Los Angeles as against \$3.33¾ at the present time, says the manager of the Tulare Co-operative Poultry Association.

The corn crop in that section is fairly promising. The wheat crop of the state is a record breaker. The price of wheat is fixed and other grains must line up somewhere in proportion to wheat. Long-headed poultrymen are biting light and trying to play safe. They do not think it advisable to stock heavy on feeds at this time.

MARKET FOR "WHITE KING" PIGEONS.

To the Editor: I wish to know where I can get some good mated pairs of "White King" pigeons and the price. I would like also to know if there is a good market for this breed or is some other breed more profitable.—Wayne Henry, King City.

The White King breed of pigeons is popular as squab producers with white skin. Squabs weigh fourteen to sixteen pounds to the dozen, when the parents are properly fed. They are gentle birds and are not inclined to become frightened while attendant is working in the loft. The claim that they are superior for squab breeding is due to their ability to feed the youngsters liberally and to their desirable formation; they are short, blocky, with heavy shoulders, deep across the chest, broad back and very close-fitting plumage. See sale offer of Frank Knolle in Poultry Breeders' Directory, who offers some of these pigeons at a bargain price.

POULTRY ASSOCIATION GROWING.

In the monthly report of the Poultry Producers of California, issued last week, Manager Barber says:

"The amount of eggs handled in July averaged 6325 cases per week, which was 16 per cent less than in June. It was 28 per cent more than we handled last July and 54 per cent more than in July, 1917, showing the growth of the association. The operating expense was 2 per cent less than for the same month last year, though cases and fillers cost 23 per cent more.

"Our receipts during July were 52 per cent of the total California eggs received at San Francisco. There were 2800 cases of Eastern eggs received during the month. Last July our eggs were 41 per cent of the San Francisco receipts, and in July, 1917, only 27 per cent. These comparative figures again show the growth of the association."

NATIONAL EGG DAY AT PETALUMA

The second annual egg day celebration at Petaluma last Saturday was a great success. The city's streets were thronged with residents interested in emphasizing the importance of the occasion, and with thousands of visitors from roundabout poultry ranches and from neighboring cities eager to participate in the unique festivities. There was a grand parade of floats, with chickens, roosters, and displays of poultry implements promi-

nent in the exhibits. The fiesta wound up with an egg barbecue and a dance at Dreamland Rink, where "Queen Marie" presided. Altogether the celebration was a glorious success.

Please discontinue my chicken ad and send me the bill. I have been just swamped with orders.—Mrs. L. A. Benoit, Modesto.

THE HOME CIRCLE

IN MEMORIAM.

There is strange quiet along the Marne,

The very trees are still—
(How can the skylarks sing again,
Who have beheld men kill?)—
Though flowers bloom along those banks

Where Life and Death once met,
And Peace returns to bless the fields,
The Dead cannot forget.

Bend, quiet trees above the Marne,
And whisper to the Dead,
That we, who profit by their pain,
Remember how they bled;
And go, ye little singing larks,
Proclaiming to the years
That here we plant their Memory—
And water it with tears.

—Red Cross Magazine.

SOME LITTLE BROWN BEES.

One bright, sunny morning early in spring, when the dandelions were the only flowers out in the grass except a few little white clovers, the Brown twins had a birthday. They were five years old. Now, like all twins, they had their birthdays on the same day every year, so this May morning was a happy one for them both.

What did they get for their birthday? Well, when Father Brown came home at noon he brought two funny little square houses not much bigger than a bird-house, and of course they knew that one was for Billy and one was for Betsy, and they jumped up and down and clapped their hands.

"Oh, what a fine house for my dolls!" cried Betsy.

"And my rabbits shall live right next door in the other house," added Billy.

"But look at the tiny little door," said Father Brown. "Surely it's not big enough for a doll or a rabbit." Sure enough it wasn't; they could see that as they looked closer.

"The little families have already moved in, children," said Father Brown; "these houses are not for rent." Then, of course, Billy Brown wanted to open the door at once.

"Look out, Billy," cried Father, but not quite in time, for out flew—guess what—why, a little brown bee. Billy tried to catch it and put it back, but he let go very quickly and put his finger in his mouth. Away he ran to Mother Brown, and when she looked at it she said, "Mother's boy is so sweet the bees are trying to get honey out of his little finger." Then both the twins laughed, but they stayed away from the beehives and played on the front porch till Father came home from work once more.

That evening after tea Father Brown took the two little houses away up in the back yard by the fence

and put each one up on a short pole, Billy's one on side of the garden path and Betsy's on the other. Then when it grew too dark to see any more, Father Brown took a twin on each knee and told them all about the little brown bees which had come to keep house in the back yard.

He told them that if they gave the little bees plenty of room they would never bother them again, but work busily all day long, gathering honey from the flowers for them all.

The next morning the little doors were hardly opened before the bees were flying out and in from dandelion to clover and back again to the hive, loaded down with honey.

Billy and Betsy loved to sit off a little way and watch then at their work. As the flowers began to bloom in the garden the bees were happy as they could be, and came back every time with all the honey they could carry. Every little bee was busy, for there are very few lazy bees.

One morning while Betsy and her doll were watching the bees and making dandelion chains, they saw two of the bees fly out of the hive and over the fence into Mrs. Johnson's yard. They were very sorry to see this, for Betsy had been told not to go over into Mrs. Johnson's yard and pick flowers, and she knew it must be just as bad to go and get honey there unless Mrs. Johnson said they might.

At last she thought what she would do. She went over to Mrs. Johnson's front door and knocked, then she waited. Mrs. Johnson was out in the kitchen baking cookies, so she had to knock again. When Mrs. Johnson came to the door, she said, "Hello, little neighbor, come right in." In walked Betsy, and she kept on going way through to the kitchen. I guess she smelled the cookies, don't you?

"Please, Mrs. Johnson," she said, "may our bees come over in your yard for honey? I thought perhaps you wouldn't care, for you have no little bees of your own. Our bees never step heavy on anything, and they never pick any flowers; all they want is just the honey."

Mrs. Johnson had no little girls of her own, and she was very glad to see Betsy, and she gave her cookies for herself, one for Billy, and one for the doll, then she said, "Little Betsy, of course your bees may come over in my garden and get honey, and you may tell them that way over by the fence the sweet peas will soon be in bloom, and they will be full of honey."

Betsy sat on the doorstep until she had eaten her own cookie and the doll's, too, and then she ran home with Billy's for fear she might forget and eat that.

After the bees had been working for a great many days Father Brown opened the hives, and he found so

Call on it when friends call on you

The next time friends call on you—call on Ghirardelli's! You'll find it equal to any occasion. And you'll be apt to say—as many another wise hostess has said:

"It's wonderful— isn't it?—how a cup of Ghirardelli's puts people at ease—helps to make them feel 'comfy' and sociable."

Ghirardelli's—the original Ground Chocolate—is not sold in bulk but in cans only. In 1/2 lb., 1 lb. and 3 lb. cans—wherever you do your trading. Look for the Ghirardelli label!

honey for herself, and she sent a "thank you" back to the little brown bees.—Gertrude Davenport, in the Kindergarten Review.

CANNING PIMENTOS.

Only ripe, sound peppers free from bruises should be used. Can the whole peppers. The small or broken ones may be cut into strips and canned or used in relishes, sauces and soup mixtures.

Remove the seeds with a slender paring knife by cutting around the stem and taking out the inside partitions. To peel, roast the peppers in a hot oven from 6 to 10 minutes or until the skin blisters and cracks. Do not allow them to scorch. Remove skin with a sharp paring knife, flatten the peppers and pack in layers in a jar which has been boiled 15 minutes. No water or seasoning is used in the canning. The processing in the jar brings out a thick liquor which almost covers them.

Put in place the rubber and top which have been boiled. If a screw-top cover is used, screw about half way on; if a glass top with wire bails, put top bail in position and have the lower clamp unfastened. Place jars on the false bottom in a water-bath canner. If the cover of the vessel in which the processing is done is not tight, water sufficient to cover the jars should be put in. Boil pint jars for 30 minutes, invert to test for leaks and, when cool, store in a cool, dark, dry place.

When a steam-pressure canner is used, process pints 10 minutes under an eight-pound steam pressure.

FASHION NOTES.

Hair nets made of fine invisible silky strands of human hair may be purchased in every shade to match every color hair. They are wonderfully helpful in keeping the hair from being badly blown when out in the air.

The newest styles in wedding rings are in delicately chased designs in either gold or platinum. Decorated wedding rings are supplanting in favor the plain gold band.

Small turbans are quite extensively worn. They fit the head very snugly and have very little trimming.

White ruffled muslin curtains are coming into fashion again and are especially good with draperies of chintz or flowered linen.

Skirts are certainly growing fuller, although the straight line silhouette retains its popularity.

Tailored hats of duvetyne are being shown for fall wear.

The new fall suits have a strong tendency to narrow shoulders and tight sleeves.

CANNING MIXED VEGETABLES.

Mixed vegetables are attractive and economical in salads, omelets, escalloped dishes and to use as garnishes for meat dishes. If the small quantities left from packing different vegetables whole are placed in one can, many desirable combinations can be made. A good combination is young carrots, peas, string beans and young onions. Another is peppers, celery, onions and small lima beans. Do not use beets in such combinations, because they will discolor the mixture.

All the vegetables are prepared separately as for canning and packed in layers in a well-boiled jar. Each layer should be packed as tightly as possible before the next is added. Fill jars with a brine. Put on boiled top and rubber. Process in water-bath canner either 120 minutes one day or one hour on three successive days, or 35 minutes in steam-pressure cooker under 15 pounds pressure.

If the bottle baby is to thrive and be healthy, the nursing bottles must be kept scrupulously clean and sweet. To accomplish this, they should be rinsed with cold water and allowed to stand filled with water. Before filling with milk, they should be thoroughly washed with a bottle brush and hot water and then sterilized for twenty minutes in boiling water. This treatment should be repeated each time the bottle is used.

When using egg whites to cover croquettes that are to be dipped in bread crumbs, beat the white only

until it is broken, not until it is frothy, and add one tablespoonful of water for each egg.

Comfortable warmth

Filled with Pearl Oil, a good oil heater gives comfort without dust or dirt. Oil consumed only when needed; portable, economical.

Pearl Oil is the ever obtainable fuel, refined and re-refined to be pure and clean burning. Order by name—Pearl Oil.

THE PREMIER BURNER ANNOUNCEMENT

"Now Comes the One-Piece Premier."

In the beginning the Premier was made in two parts and welded together. The scientific principles were proven to be correct. This being 100 per cent perfect, we sought to improve its construction. Then our Engineers conceived the Adapter Nut idea, which proved an advancement over the welded type. Still not being satisfied, our Engineers and Chemists experimented for many months, and our one-piece Premier was the result. So we now have in construction the same point of perfection that we had in the beginning obtained in its performance.

BARLEY.

There has been practically no business in barley during the past seven days. With September 1 a holiday and the parade of the sailors from the fleet on Tuesday afternoon, there have been only two full business days, last Thursday and Friday, since last report. Barley is not being shipped to Europe in the quantities of a few weeks ago, and the market is weak although prices are nominally unchanged.

Feed\$3.00 @ 3.05

HAY.

Receipts of hay for the past week were 3,459 tons, compared with 2,971 the previous week. Thus, notwithstanding the railroad strike, which tied up the railroads for two days, receipts are higher. This was occasioned by the extra hay receipts by boat from bay and river districts, which have been unusually heavy and will doubtless continue if boats are available. Most of the hay arriving during the week was of the red oat variety from the reclaimed districts and alfalfa from the river districts. This hay moved off fairly well, but the demand has not been brisk as many large consumers are becoming filled up and are out of the market.

Alfalfa Products\$36.00 @ 37.00

POTATOES, ONIONS, ETC.

With the railroad strike stopping shipments for full two days, a half holiday Saturday, a full holiday Monday, and a parade Tuesday, which virtually closed up business another half-day, there has been little doing in the potato and onion markets during the past week. While shipments to this market have not been beyond the capacity of the market, the supply on hand is ample to take care of the demand. Some dealers are looking for a considerable demand from the vessels of the Pacific fleet now in harbor. In the general vegetable market there were few changes in prices.

BEANS.

The bean market continues in the dumps and the prices of several varieties were lowered in an effort to attract buyers. This had little effect on the demand, but it is possible that sales may be made for the fleet that will have the effect of putting a little life in the market. This would be but small relief, however, and dealers declare that no real relief is at present in sight.

BUTTER.

Local trading in butter is reported very good, and this, together with some outside demand, has reduced local holdings. The close on extras was only a half-cent above the close of last week, while firsts were a cent higher. It is generally felt that there will be a greatly increased demand for butter locally during the presence of the Pacific fleet in these waters. This demand has not yet made itself felt, but it probably will do so during the coming week. The receipts during the last calendar week were only 16,000 pounds more than the corresponding week a year ago, and this is hardly enough to take care of the normal increase in population. There is plenty of butter in storage as Government reports show a 50 per cent increase on hand in San Francisco compared with a year ago.

EGGS.

After the opening last Thursday, when Extra eggs were quoted a half-cent lower than the previous day, extras have shown a decided advance each day on the exchange. All other descriptions except the undersized show an increase, although not to the same extent. Again the presence of the fleet in this harbor is credited with increasing the demand, and it is said that this demand will continue as long as the fleet remains. The average price of extra eggs charged the retailers during the month of August was 58.63 cents. A year ago the average price for August was 54.92 cents. This year August receipts in this market were 50,152 cases. A year ago the month's receipts were 39,328 cases. The comparison is interesting.

CHEESE.

The cheese market was lower this week. Offerings were more liberal than they have been for some time, and the holders appeared to be making an effort to clean up some surplus stocks. Liberal offerings of Oregon cheese had a temporary depressing effect on the market and the tendency of all prices was downward.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., September 2, 1919

The recent tie-up due to the strike situation in California stimulated markets generally. Prices ruled very even with the week previous on Bartlett's with stock showing color and fruit arriving ripe. Ordinarily this condition would cause a depression of the market, but it was offset by lighter offerings and a strong demand, with the result that inferior fruit realized satisfactory prices.

Lighter offerings of peaches stimulated demand and there was a noticeable advance in prices over the week previous, in some cases 50c to 60c a box.

The arrivals of plums were light in all markets and there was a noticeable improvement in prices, with the possible exception of New York and Boston, preference being shown in Middlewestern markets.

Prices were satisfactory and the demand continued strong for Malagas; increased offerings, however, causing a slight fluctuation, with a downward tendency. A reaction was noticeable during the latter part of the week, brought about by a scarcity of supplies due to strike condition. What few Tokays have arrived in the East, sold to good advantage.

Practically all tree fruit shipments will clean up in Placer county and other sections of the State, with the exception of Santa Clara Valley and El Dorado county, this week.

FRESH FRUITS.

The arrivals of a plentiful supply of apples on a market, more or less shot to pieces by a brief railroad strike and holidays, had the effect of lowering the prices of several varieties. While there were minor changes in several descriptions of fruits, prices bore up well under the general conditions prevailing. The demand for fruits on Wednesday was heavier than for several days past.

DRIED FRUITS.

There is more confidence in the future of the dried fruit market than for the past two weeks. The market is quiet, almost inactive, but there has been some trading at current prices. While the strong "bull" market of a few weeks ago is not expected to become apparent again, it is believed that this market will show a gradual increase in trade, although it is not believed that higher prices for any descriptions will prevail this season.

RICE.

Rice continues quiet and slightly lower. Fancy is quoted at \$12 and Choice at \$11.75 for spot. In futures, fancy is unchanged and choice \$10.65.

HONEY.

There is no change in the honey situation. Very little is coming into this market, al-

though some could be sold at prevailing prices. The demand is so irregular, however, that dealers are not inclined to buy any stock until it is already placed, and this makes the local market dull.

Water White Orange Blossom18 @ 20c
White to water-white sage (subject to production)18 @ 20c
Amber Mountain (Sage-Buckwheat)16 @ 18c
Light Amber Alfalfa14 @ 15c

WOOL.

The wool market is firm, especially on the side of the finer grades. The amount of wool used during July—63,000,000 pounds—exceeded the consumption for June by 8,000,000 pounds, and the June figures broke the records for 1919. Locally the market is quiet, and prices are more or less nominal.

HIDES.

It is believed that the highest price level of hides has been reached and passed. The tanners throughout the country are out of the market for stock, fearing to undertake large business at the abnormally high prices that have latterly prevailed, and in the face of the widespread agitation against the high price of shoes and other leather goods.

Wet Salted Steer Hides—

No. 1 native steers, 50 lbs. and up32c
No. 1 native cows, 60 lbs. and up32c
No. 1 extremes, 30 to 45 lbs.40c
No. 1 buff, 45 lbs. and up34c
No. 1 native bulls25c
No. 1 center branded hides, in all grades, 2 c less than base price and No. 2 center brand, 3c less
No. 1 wet salt kip, 15 to 30 lbs.45c
No. 2 wet salt kip, 15 to 30 lbs.78c
No. 1 wet salt calf, trimmed68c
No. 2 wet salt calf, untrimmed68c
No. 2 calf, 2c less per lb.
Wet Salted Horse Hides—
No. 1 large, skinned to hoof\$10.00 @ 13.00
No. 1 medium, skinned to hoof\$7.00 @ 9.00

LOS ANGELES.

Los Angeles, Sept. 2nd, 1919.

BUTTER.

This market reports demand good with prices firm. Owing to unsettled conditions with regard to shipping we are unable to secure correct statement as to receipts for the past week.

California extra creamery59c
do, prime first57c
do, first56c

EGGS.

Receipts very light on account of the strike. The market is firm, however, and the demand continues good. No receipts available for last week.

Fresh ranch extra53c
do, case count52c
do, pullets47c

POULTRY.

Poultry coming in less freely and the market is steady. Demand is fair, both for hens and young stuff. Very little doing in turkeys and geese.

Broilers, 1 to 1 1/2 lbs.26c
Broilers, 1 1/2 to 1 3/4 lbs.26c
Fliers, 2 to 3 lbs.24c
Roosters (soft bone), 3 lbs. and up16c
Stags and old roosters, per lb.34 @ 40c
Turkeys24 @ 34c
Hens27 @ 34c
Ducks27 @ 34c
Geese27c

FRUITS.

Not much that is new can be said about this market. Recent unsettled conditions have made it impossible to say, with accuracy as to prices. Only truck and wagon receipts are in, but they were sufficient to supply the local demand with what shipped in stock already on hand. The demand is fair for all choice to fancy stock. Stale stuff is hard to move.

Peaches5 @ 6c

Special Citrus Market Report

Los Angeles, Sept. 1, 1919.

The supply of Valencias in the East was generally cleaned up, and prices rule \$1 higher throughout the country as a result of the railroad tie-up. However, some 400 cars of Valencias, packed and loaded on cars, were hurried forward via steam lines when the electric lines went out, and where too late, were stored in pre-cooling plants. Packing houses that were closed down are starting shipments to all the demand caused by lack of movements. Some apprehension is felt regarding redelivery of empty west-bound cars.

There is little demand for lemons at this time of the year, and the tie-up of lemon shipments could not have come at a more opportune time.

Packings are light and readily taken care of in the curing rooms of the packing houses. Trading is at a standstill with the exception of a few sales being shipped by boat to up-coast points. Six dollars a box for best stock is the ruling price.

Shipments of oranges for the season total 30,780 cars, as compared with 19,188 to date last year; lemon shipments to date are 8,756 cars, last year to date were 5,170 cars.

DRIED CHILE PEPPERS.
This market remains the same as quoted last week. Very little doing.

Special Livestock Market Report

Written for Pacific Rural Press.

San Francisco, Sept. 3, 1919.

CATTLE—Cattle are arriving very freely, though most of the receipts are of the lighter kind. The Nevada shipping season has opened, and the first carload is expected to arrive about September 8. The quality of this stock is always good. Quotations stand. The Eastern cattle markets are recovering from the recent depression.

Yearlings \$8.50@ 9.50
Prime ewes \$8.00@ 8.50
Lambs \$12.50@13.50

LOS ANGELES WILL HOLD A BIG SHOW.

C. R. Thomas, manager of the Los Angeles Livestock Show, who is visiting the State Fair, says that all indications are right for a great show in October. Sixteen barns are planned and started, with nine almost complete. A large force of men are pushing the work and more will be built if they are needed. Fifty-five thousand dollars are offered in premiums for the stock exhibits and \$20,000 for a race meeting at the same time. The Holstein-Friesian breeders will hold a consignment sale of 60 head, and the Duroc-Jersey swine breeders of Southern California are contemplating a sale at the same time. The Hampshire swine breeders may also hold a sale.

The Dairy Council will hold a meeting during the same week and also Zone No. 5 of the Cattlemen's Association will meet and discuss their affairs. Last, but not least, is a saddle horse show and a dog show. Manager Thomas is very enthusiastic and promises stockmen a royal good time.

SAN FRANCISCO SHOW THE BIG EVENT.

The California International Live Stock Show to be held in the California Building, San Francisco, November 1st to 8th, is organized in response to a demand of the stockmen of the state for a show that shall adequately present and promote the livestock and dairy industry of the West. It is dedicated to the proposition that the Pacific Coast offers opportunities for the development of these industries unparalleled elsewhere, and that the world should know it.

The success of the show and its value to those in whose interest it is given will depend upon the interest and support they themselves give it. While San Francisco makes the show possible, it is your show, and the Board of Directors most cordially invites you as exhibitor and attendant to a full participation in it.

W. T. SESNON,
President.

GORDON H. TRUE,
Secretary and Manager.

MISCELLANEOUS.

WANT RESPONSIBLE AND EXPERIENCED fruit alfalfa or grain irrigation farmers to work on crop share basis. Land is river bottom tule land, plenty of water, good living conditions and good markets. Will enter into one or two years' contract with right men and might extend same into option of purchase. Party should have some implements, live stock, or money with which to buy them. Please state age, farming experience, from whom you have rented amount of livestock and implements you own, financial condition, and size and age of family. State when your services will be available and amount of land you can handle. Address: Herman Janss, San Joaquin, Fresno county, California.

EXPERIENCED SUPERINTENDENT or foreman wants to take charge of diversified ranch or group of ranches. Familiar with grain, beans, stock, alfalfa, irrigation, dairying and hogs, as well as truck farming on large scale. Agricultural school graduate, backed by several years' experience. Would consider a proposition with opportunities for a partnership. Married. Write Box X, Pacific Rural Press.

WANTED—Steady, capable man to take charge of mountain ranch, Santa Clara county; must be experienced in fruit and stock farming. Good house. Write, stating experience and wages expected. Lock Box 7, Campbell, Cal.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Sheeter Pipe Works, 304 Howard St., San Francisco.

ELECTRIC PIANO—Attaches to electric light socket. Endless rolls of music, suitable for dancing or can be used "nickel-in-slot." Good condition. Fine electric motor, \$150.00 cash. Cost a great deal more. 2433 Telegraph, Berkeley.

AGENTS WANTED—SELL AUTOMOBILE Tires and Tubes on liberal commission. Address Arnott & Co., Dept. 11, Los Angeles.

MARRIED MAN—Hog and general farming experience required. Box 1640, Pacific Rural Press.

MADE OF REDWOOD, Hawley's Perforated wooden well casing, the best and cheapest well screen made. Send for descriptive circular. G. M. Hawley, La Mesa, California.

CROLEY'S BALANCED HOG FEED—The cheapest feed to fatten hogs. Write Geo. H. Croley, Townsend St., San Francisco, Calif.

PATENT ATTORNEYS.

WEBSTER, WEBSTER & BLEWITT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Wellsham Pipe Works, 160 Eleventh street, San Francisco.

DAIRYMAN wants place on shares or for wages. Experienced and reliable. Have family. Address, Box Y, Pacific Rural Press.

COUNTRY LANDS

DAIRY AND ORCHARD RANCH for sale by owners, about 120 acres. Good location, new buildings. Will be sold on easy terms and reasonable price. \$10,000 will be accepted as first payment. Alex T. Gibson, P. O. Box 561, Chico, Cal. Residence, 216 East 1st Ave., Chico, Veclino.

ATTRACTIVE DAIRY RANCH
80 acres highly improved and equipped, located at station on main line railroad within 90 miles of Oakland; 150-ton barn, 60 stanchion milk barn, large tank house, 5-room house, family orchard, silo, cooling and separator machinery with boiler and engine, milking machine, 4 horses and all farming implements; about 70 acres in fine alfalfa, 8 acres corn; all deep, rich, sandy loam soil; checked, leveled and boxed; irrigated direct from district ditch; facing two county roads. About 60 head of very fine dairy cattle may be purchased with the place. This herd holds record for Sanislaus county on alfalfa feed alone, one producing an average of 2.83 pounds butter fat per day for 28 days. This place will pay \$1,000 per month to a good live dairyman. Write or call for further particulars and arrange to let us show you this place.

F. D. BURR CO

THE FAMILY FAVORITE

That up-and-comin' youngster of yours—just watch how he heads for his morning bowl of Germea! For, he knows there's something about Germea that's different—something you can't expect to get in the ordinary, commonplace "morning mush."

And that something is *life-energy*! It's the life-energy in Germea that makes it power-food—that makes youngsters and grown-ups alike warm up to it morning after morning! It's the concentrated food-energy in Germea that makes it *economical*; for mother knows that a single cupful of Germea will make a breakfast for a family of six.

Germea is unlike any breakfast food because it contains the "germ"—the very *life* of the wheat. That's why it builds strength and stamina! That's why nothing can take its place as a nourishing breakfast cereal. That's why Germea is the family favorite—year in and year out!

The first cereal to be put up in package form—Germea is today, as always, the premier breakfast cereal of the Pacific Coast. Ask for Germea in the familiar Red Package—at the store where you do your trading.

SPERRY FLOUR CO.

GENERAL OFFICES, SAN FRANCISCO
U. S. A.

Ten mills and forty-four distributing points on the Pacific Coast

A31

Not only is Germea a cereal of high food value—but it lends itself to other delicious and nutritious dishes—as witness these two tested recipes:

SPERRY GERMEA PUDDING

$\frac{1}{2}$ cup uncooked Sperry Germea; 2 cups milk;
 $\frac{1}{2}$ cup sugar; 2 tablespoons butter, melted;
1 well beaten egg; 2 cups grated pineapple or
other cooked fruit; 1 teaspoon cinnamon;
1 teaspoon salt.

Mix all together, except fruit. Cook half an hour, then add the fruit, place in a double boiler and cook half an hour longer. Serve hot or cold and with any desired sauce or cream.

SPERRY GERMEA SPANISH

$1\frac{1}{2}$ cups Sperry Germea (cooked); $\frac{1}{2}$ can corn;
1 tablespoon butter; 1 teaspoon salt; 1 onion
chopped fine; 6 olives chopped fine; Cayenne
pepper to taste; 1 green pepper chopped fine.

Mix all ingredients, put in casserole, cover and bake in medium oven 30 minutes.

Note—All measurements are level. A half pint measuring cup is used.

Livestock Looms Large at State Fair

Written for Pacific Rural Press by Thos. F. McConnell.

THE EXHIBITS in the livestock department of the State Fair for 1919 bore the searching inspection of the eyes of the Eastern judges without finching, and in the end called for only the most favorable comment from them. It is safe to say that never before in the history of the State have the numbers and quality of the animals shown been equaled as a whole. The beef cattle exhibit has been larger, perhaps, but never better. The draft horses also have been more numerous, but again the quality was supreme.

Exasperating Delays.

Judging the different classes in the livestock department was supposed to have started Monday morning, but long before that time it was known that the railroad strike of Southern California would delay matters for the day and perhaps longer. Word from breeders on the road kept coming in by "wire" asking that the judging be deferred until they could arrive. Some of these breeders overcame almost insurmountable obstacles in order to compete at the State Fair. Trucks, boats and express shipments were all used to "beat the strike" and its delays. One large exhibitor of swine sent his hogs 200 miles by truck and several trucked them shorter distances. Another exhibitor showing beef cattle trucked them 15 miles and loaded in freight cars only to unload and truck them home. Then he received word that the judging would be deferred until he could arrive by express, so he hauled the cattle to the railroad the second time and arrived Monday night. Certainly great credit is due the men who spared no effort to be present and also to those who waited so patiently for the belated ones to arrive.

Beef Cattle Exhibit Should Have Been Larger.

As said before the beef cattle exhibit should have been larger, as there are plenty of beef cattle in California, not only purebred range stock but "sure enough" top-notch exhibition stuff. Why was it not in evidence? There is some good reason for its absence and that reason should be sought out in such an essential department and the difficulty eliminated. A state like California with such wonderful stock raising resources should have a beef exhibit that would astonish the world and make our Eastern brothers open their eyes. The University Farm at Davis has shown these same Eastern feeders and fitters what we can do in the fat classes and it can be done in the breeding classes as well.

Dual-Purpose Shorthorns.

When we speak of Shorthorns many of us think only of beef cattle, but, to begin with, the Shorthorn was as good a dairy animal as any, and while they have achieved a reputation second to none as beef cattle, there is a strain of them that is noted for both beef and milk, or in short the Dual-Purpose Shorthorn that will produce a large quantity of milk and also steers that grow into beef economically. There were fully as many of these Milking Shorthorns on exhibition as of the beef type. The writer has often admired them and thought of how they were the true cow for the pioneer, as well as for the inhabitants of the older regions. Wherever the Anglo-Saxon race has gone we find cattle of this breed right along with them. The pioneer wanted an animal that would furnish the milk and beef both, therefore the Shorthorn was a companion of a large proportion of the early settlers in this country and other parts of the world as well. All credit should be given for what they have done in the past and what they are doing now.

Milk Breeds Well Represented.

You see we are going along and gradually changing in this article from the pure beef type, the dual-purpose breed, to what are termed the real milk factories, the dairy cattle. The exhibit of the four principal breeds was large and well worth going a long distance to see. These four great breeds were exceptionally well represented in all classes. Hugh G. Van Pelt, who judged the dairy animals, said, "You have wonderful dairy cattle and you have a wonderful climate, particularly favored for long distance records to raise them in. Never have I seen any better cattle, particularly in the younger classes. The Guernsey exhibit would have been larger if the strike had not prevented the Edgemoor Farm cattle from coming.

Hogs—Reds, Whites, and Blacks.

"Pigs is Pigs" is the title of a very popular short story published some years ago, but if the writer of that short story had been at the State Fair this year he would have made the title "Hogs is Hogs," for that certainly was the case at the Fair this year. Not "reds, whites and blues," although that may be possible in the future when the "Blue Hog" comes into his own, but surely "reds, whites and blacks" in all sizes and ages, but all good. Some had some little thing that the judge did not seem to like, but really the differences were slight in all cases.

The three Eastern judges of the

EDITORIAL.

RIGHT SIDE OF THE PLANET.

IT IS possible that the old world will wobble around less if Americans get back to their own side of it. During their absence they surely have upset a lot of European plans and calculations, and they have steered the resultant of opposing European forces to the right social, political and humanistic objectives—so far as any objective has been reached at all up to this time. It really does appear to many now that Americans have mixed-in abroad quite as much as Europeans desire and possibly quite as much also as is good for themselves. On the other hand it appears to many others that Americans ought to keep on mixing until they turn out something which will pass for the millennium. This is, of course, our chief political contention, and to mix or not to mix—that is the question which now bids fair to determine our next presidential succession in this country. President Wilson is now a week out from Washington with his exhortation that the American spirit must be kept visibly burning in all the dark spots of the world, and our Senator Johnson has hitched up to follow him—proclaiming that the proper way to serve the American spirit upon the world is to can it at home and export the surplus in the regular way, which was patented by Washington, et al., and prevailed until Woodrow carried it over in his grip-sack—the which, if George had essayed to do, he would have been hanged in the Tower!

However, politics are not our funeral, but we have a right to say that the obsequies are becoming very lively and that California farmers are taking much interest in them—waiting only to get their prunes, raisins, grapes, beans, etc., out from under the shadow of the September rains, which seem threatening this week, to spend many of the delightful autumn days in wrapt contemplation of the oratorical antics of Woodrow and Hiram, which will have so much to do with shaping the political future of this country!

HOOVER RUNS FOR THE HOME BASE!

As we are writing on Monday morning General Pershing is landing in New York among the deafening well-done plaudits of his grateful countrymen. Congress has voted him permanent exalted rank, and all the people are saying amen in words or in louder actions. It is said that only thirty-eight thousand American soldiers remain abroad of the millions who rushed toward the front and did their duty so gallantly and successfully. These facts emphasize our contention that the place for Americans is on this side of the planet. But of all those who are coming, the utterance of no one bespeaks so frankly and feelingly the inmost longing of his heart for life and action in his home land than does our honored California Herbert C. Hoover. A cable-writer who caught him just as he was taking ship for home on September 6 makes him say these things:

"I am not coming back to Europe again under any circumstances. Possibly I may never see

Europe again. I am through with food. My offices have been dissolved and the work turned over to a commission. When I reach New York I am going to California at the earliest possible moment. There is no truth in the report that I am coming back to Europe. I have been asked to retain my official position here. Several nations asked me to remain, but I am through. I don't know if I shall ever come back for private reasons or not. I have never thought about it, and I don't want to think about it now. All I want to do is to forget about food and famine and Europe's affairs for a while."

Come back, Mr. Hoover and get what belongs to you in this admiring State of yours! How we would love to lay out your first California breakfast for you! Take a honey-melon, big as a camp-kettle; a slice of ham wide as an elephant's ear, gemmed with eggs dropped upon its well-browned surface as thickly as medals on the breast of Marshal Foch; tiers on tiers of pure, white rolls, broad and deep as the piles of shells on the greatest ammunition dump of the allied and associated nations; coffee chucked with sugar until the spoon stands resolute in the center thereof, and hot-cakes rising to the apex of the Eiffel tower! Forget about Europe for a while at least. You have helped nobly to save Europe to live her life, and it is your right to live yours! You are a representative American to refuse the blandishments of the European population-managers and get back to the right side of the earth!

THE FLEET IS ON THE RIGHT SIDE.

Out of all the joyful, patriotic hubbub which has gone aloft from the two great harbors of California and from half a dozen near-harbors, of which we are also proud, there are three declarations which are of sharp and enduring significance to this side of the nation. One defines the greatness of the fleet; another that it is ours to keep; third, the influence it will have in the development of California and her northern sister states along the coast. There were many admirable things said by landlubbers resident and visiting, and the daily papers have properly recorded them for the inspiration of their readers. We, however, have no space for such passing phases of the serial event, and being forced to the most admirable utterance, and desirous of having it keep well, we take it salt—to wit straight from the tongue of the admiral who will have the doing of the things he talks about:

This is your fleet: it is yours for protection, to promote and encourage the development of your merchant-marine and your trade through the Panama canal and everywhere around the Pacific. It will stay on the job; it will require ample bases of supply and facilities for keeping in first-class condition. It will live and for you on this coast. As your fleet is now in its home ports, perhaps you would like to know what it is and what it can do.

The Pacific fleet is more formidable, ship for ship and gun for gun, than the entire fleet of any other nation save Great Britain. In other words, half of the great American fleet is stronger than the armada of any nation with the single exception mentioned. The Atlantic and Pacific units could be brought together in seven days in case of sudden emergency.

If our fleet were at sea and we should sight an enemy at a distance, say, of ten or eleven miles, inside of two minutes our instruments would have allowed us to plot her speed and her course. We would have drawn lines on charts to show her direction and her rate of advance. In the same time we should have plotted our own speed and our own course. At the end of that two minutes we should fire and expect to hit. Within the next two minutes the guns of one of these great ships, such as the New Mexico, would have sent after that enemy some forty tons of steel shells. The battleship New Mexico alone could wipe out the entire fleet that visited the Pacific over a decade ago on its famous voyage around the world.

Of course we do not desire such things for war. It is very trite and very true that we need them to keep out of war and to keep other people out of it also. The facts declared by Admiral Rodman are very comfortable to think about. The cities will think and talk about them in the midst of distraction. We doubt if any such depth of thought will come in the bustle of landmen as will warm the heart of the lonely tractor-man as he plows the boundless plains of the great California valley amid the voices of the night, under the guidance of the solitary moon! To him will come most impressively the realization that this great fleet is on the right side of the planet!

THE MOTHER OF THE FLEET.

Never since Vergil pictured the seaside activities of Queen Dido of Carthage has there been a naval engagement on land in which a woman led in the doing of it as did Mrs. Secretary of the Navy Daniels in the San Francisco bay event. Secretary Daniels was all right, of course, and he made a good personal and patriotic impression, and the fact that he threaded his way among the local politicians without getting a scratch shows that Josephus surely inherits some of the powers of his great ancestor, who had the art of strolling through royal menageries and keeping a whole skin. And this is the way Mrs. Daniels led the popular rejoicings toward the apex of womanly devotion and patriotism:

"No greater honor can come to womankind than to be the wife of an American and the mother of Americans—exercising the high privilege of giving American ideals to future generations!

"I want you to take me as one of yourselves. I have not official position. I am simply accompanying my husband. It is true that I am called 'The Mother of the Fleet,' and I claim that honor, for I had two sons in the service, one in the olive drab of the marines and one in the blue of the navy."

And the assembly of women, to whom these lofty sentiments were spoken was no angelic host of movie queens, nor was it a bunch of ordinary bean-boilers. They were spoken at a reception on one of our municipal mountain-tops given to Mrs. Daniels by the Daughters and Sons of the American Revolution, the Daughters of the Confederacy and the Colonial Dames, in all of which organizations Mrs. Daniels holds memberships. Yes, indeed, oh shade of Publius Vergilius Maro: "Dux femina facti!"

CALIFORNIA WOMEN, STAY AT HOME!

And now that we have started in to write about the girls we find it hard to stop! We dared to say long ago, when California women first had their God-given right to vote restored to them, that it would be a tremendous force for the upbuilding of the State, because it would set all the other women in the world to talking about it—beside which motive power the anticipated force of the league of nations would be as a zephyr to a tornado. And it is surely working out that way. California is not only gaining fast in the citizenship of women, who bring capital for investment in grand home-places, but women from a distance are each year multiplying not only in the lists of our large scale industrial investors, but are also multiplying as personal workers and developers of individual producing enterprises in agriculture and other activities. And when women of prominence elsewhere come merely for recreation and the wisdom drawn from travel and observation, they seldom fail to say something to indicate that they rejoice with California women in the advantages and opportunities which attend their lives in this State. Among those who have most recently rendered California such acceptable service is Mrs. Frank A. Vanderlip, wife of the leading New York banker, whose patriotic services to this country and to the world are well known. A reporter who has seen Mrs. Vanderlip describes her as "the mother of six children, who is particularly interested in public movements of the welfare of women and children, and who says that the industrial schools and playgrounds of California are far in advance of any other State, and she desires her children to see California." But Mrs. Vanderlip is a leader in Eastern undertakings for the equal rights of women, and though she is not here on any campaign, she does not hesitate to tell our women how well they are situated under the laws and institutions of California. These sentences are surely significant:

"A California woman," said Mrs. Vanderlip, "going to New York State, would lose equal guardianship of her children. If she went to Pennsylvania she would lose the right to vote, and if she went to North Carolina she would lose a third of her husband's estate and get only a dower right. It is a ridiculous and confusing condition to exist within the boundaries of a great country."

Therefore, remember this, Daughters of California! If profiteers from other states or potentates from other countries entice you, the social exchange rates are heavily against them and you should require a great excess of love or some other

valuable consideration, as compensation for your losses in renunciation of California citizenship.

THE STATE FAIR ON THE HIGH.

As we write, this year's State Fair is running smoothly on the high speed toward a most satisfactory completion on Wednesday evening. We give our space quite freely this week to phases of the exposition, which naturally appeal most directly to our constituency—including the awards in classes of exhibits for which the countryside is most anxiously waiting. So far as our observation has gone our metropolitan dailies, which never weary of stroking their bump of devotion to the great industries of the State, have screwed down the boycott lid pretty tightly on this year's State Fair, and have allowed hardly a line of publicity to enter their columns since the opening day. City people have looked in vain to see whose ox was girdled by a prize ribbon, or whose ass brayed in the governor's presence! Even such momentous matters as these, which usually manifest their devotion to our greatest industry, have been expunged from their pages. Perhaps, if the prize cow had air-planed over the moon the lid would have been lifted a little—but no such stirring industrial event occurred, and so all the reports of the things which Californians have been doing to secure the best and most significantly valuable animals and farm products generally, have gone into the waste basket. Of course there is the excuse that the great affairs of the fleet required so much space, but a few square yards less of cloudy pictures and of alleged humorous drawings, which fall below the old standard of "comic valentines," would have served the public better, and some show of justice could have been done to the State Fair. However, it may not be for us to complain. The public is coming more clearly to understand that if it desires to get the news about California farming, it must depend upon our hard-working and conscientious agricultural journals.

But metropolitan neglect has depressed the State Fair neither in the breadth and quality of its exposition of what California is doing, nor in the popular appreciation of it. Our judgment is that we have never had a State Fair so well planned and outfitted, nor so rich in materials and methods of showing them forth, and our special writers, who treat different phases of it in our columns this week certainly convey to the reader some idea of the high educational and industrial value of the effort which the management has put forth and the exhibitors have justified.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Cutting Sweet Sorghum for Fodder.

To the Editor: I have some amber sorghum, sown broadcast. When is the proper time to cut it for fodder to feed to mills stock.—J. H. A., Ripon.

It can be cut and fed to advantage as needed after the heads have formed. To get the greatest nutritive content, cut when the seed is in the milk, but it is desirable later than that of course.

Keeping Fall Apples.

To the Editor: Can you tell me how to keep Gravenstein and Bellflower apples? We grow them and wish to keep them as long as possible for eating.—E. P., San Lorenzo.

They are fall apples and are not put up by Nature for long keeping. They are successfully held until midwinter in cold storage. Without carrying your boxes to a cold storage plant in Oakland, you will have to do the best you can with a cellar or ground pit, where there will be a cool and somewhat moist air until the rains come on, and then storage in any shady room will do if you can sprinkle the floor occasionally to keep the air moist enough to prevent shriveling.

Rooting Berry Tips.

To the Editor: I have a bush growing here which is very much like a loganberry only of a much finer flavor. I wish to take off some cuttings, so as to be able to plant some more of the same bush. Can you advise me how to do this,

and the proper time of year?—L. C., Brockway.

You probably have a Phenomenal berry, which has a blander flavor as you describe. Cover the tips of the new growth with a few inches of earth, or dig a shallow trench and cover the whole length of it, and it will make a new plant at each node or joint. Do this right away and it will make plants this fall for planting out next winter or spring. It is not easy to make cuttings grow.

Corn Ear-Worm.

To the Editor: I am raising Early Crosby sweet corn that is infested with worms to a greater extent than usual. Can you suggest any preventive or cure. The soil is deep, sandy loam.—R. L. G., Lodi.

Dusting the silk lightly as soon as it appears, successively, with lead arsenate powder has apparently saved more corn than any other method. There is much difference in the amount of infestation between different plantings—sometimes the early sown is cleanest, sometimes the late sown, etc. The moth flies in several broods and when the silk happens to come out in the main flight of a brood, it is apt to catch a big charge of eggs.

Moving Strawberries.

To the Editor: In March of 1918 I set out some new Oregon strawberry plants. The first season they bore nothing but made fine growth. This year they have done fairly well. We must move, and though I intend to set runners for new plants, will it pay me to also take some of the old ones, or would the transplanting set them back too much?—R. G. J., Paso Robles.

Your plants are not old and if you fail to get enough new sets from runners you can move the old plants, if you can let them slow down pretty well towards dormancy before you have to move. We should not consider it a good way to start a commercial plantation; we would rather buy good young plants—but if you wish to take the dear old things along all right. Some of them will require your affection, no doubt.

Tip-Failure of Young Trees.

To the Editor: I am sending tips of apple and plum trees. They are three years old. The trees were sprayed with lime sulphur solution in the spring, but have been affected with some disease all summer. Will you kindly tell me what is the matter with them and some remedy to cure it.—J. A. K., Tipton.

There is no specific disease in or on the tissue to which remedial applications could be made. The tips are prematurely dying—apparently from inadequate root action. This might be due to lack of soil moisture, which would destroy the root-hairs or, in the presence of ample moisture, it could be caused by alkali in the soil or irrigation water, which would destroy these root-hairs, and thus render the roots impotent to support the top growth.

Crude Oil Whitewash.

To the Editor: What is the proper mixture of lime and crude oil to use as a repellent for borers on fruit trees? I once used it years ago with the most complete results, but I have forgotten the formula. I mixed it thin and applied with a spray pump after the borers had been dug out in the winter. Have other growers made a success of it?—C. J. R., Morgan Hill.

Oil was used at the rate of one pint to five pounds of lime—the oil to be stirred in when the lime was boiling well by the addition of hot water. Best results were usually secured by slaking the lime in an iron kettle over a fire and continuing the boiling by the fire heat after the oil was added. This boiling makes an emulsion which can afterwards be thinned down by water to proper spraying consistency. This dope has recently been largely displaced by the brushing on hot of Asphaltum Grade D. after digging out—from a little below ground to a foot above the surface.

Sowing Alfalfa.

To the Editor: We are going to put in alfalfa. When is the best time to plant it in adobe soil? Would you advise to plant it now, or wait until spring, say March or April? Does not alfalfa need more irrigating in adobe soil, where the ground cracks than in other soil?—R. C. E., St. Helena.

If your soil is sufficiently moist from showers or irrigation, and your place is not down in a frosty bottom, put in the seed as soon as you can get the ground ready and you will get growth enough to make the plant hardy against winter frosts. If you are in a place frequently hit by fall

frosts, put it in in the spring. Alfalfa on an adobe requires much less water than on a loose soil; in fact, if you try to put on as much water as they use on light soils you will drown out the plant. More frequent irrigation and small amounts of water each time will give you best growth and the shade and the water will take the crack out of the adobe.

Killing Morning Glory.

To the Editor: Please tell me how to kill the small white morning-glory. I have a patch where I had barley and have plowed the ground four times this summer and they are still growing thrifty. I want to sow alfalfa in the spring but would like to kill the vines first.—P. J. G., Dos Palos.

Stop plowing; you are merely planting more morning-glory. Get a "weed knife" or a flat-toothed cultivator, keep the edges sharp, and run it through the patch every Monday morning at eight o'clock, so that it will cut about three inches under ground, and see that the swaths lap so that every particle of the surface is undercut. Never wait to see a green shoot above ground; if you do you have lost the game. You ought to have begun two months ago, but you may still depress it a good deal during the next two months, because it will be trying to make roots to winter-over with. Start the alfalfa as early as it is safe from frost in your place and the alfalfa will take care of the glory better than any other plant we know of.

Glory Collars for Fruit Trees.

To the Editor.—In a new orchard infested with morning glory, would it be feasible to surround the trees with a sheet of black building paper, say two feet square, throwing a light covering of dirt over it to keep it in place, in order to save hoeing every few days? The paper would be put on after the orchard was well worked up in the spring and removed after the fall frosts prevent the growth of morning-glory. Would any harm result to the trees from this practice?—Subscriber, Danville.

It is a very interesting suggestion: how it will work and how much it will cost to install the collars and keep them in place will have to be worked out by experiment. If the collars are buried, as suggested, and there is covering enough to prevent leaks of light, it is presumable that the cover would also prevent loss of moisture, and therefore would both keep the glory from growing and the ground from baking at the same time. It is a reasonable suggestion and needs only demonstration by actual test. It would not injure the tree.

Pomegranates and Alkali.

To the Editor: I have five acres of strong alkali ground that will not grow such fruits as peaches and prunes. I have been advised by reliable nurserymen to plant pomegranates, but before ordering trees I would like to have your advice on the matter.—W. M., Porterville.

It is true that pomegranates will thrive in wet spots where other fruit trees are apt to get waterlogged, and it is also true that in your valley such spots are apt to be more or less alkaline, and up to a certain amount the pomegranate will stand that also. There are, however, two points for you to consider. It is very easy to get too much alkali for pomegranates and, if that is avoided, it will be very easy to get too many pomegranates for the current demand. As the fruit cannot be canned or dried, or even profitably fed to hogs, there is a chance of losing more money turning alkali into pomegranates than in letting the alkali give you whatever field or forage crops it will. If you are the only one to whom your nurseryman gives the advice, you may make a lot of money; if not, you may lose a lot. The pomegranate is like the league of nations—it is only safe with reservations.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending September 9, 1919.

Stations—	Past Week	Seasonal To Date	Rainfall		Temperature	
			To Date	Normal To Date	Highest	Lowest

Tractor Improvements Seen at State Fair

Written for Pacific Rural Press by R. E. Hodges.

The facts quoted in our panel are from the "Foreword" written for the California Tractor and Implement Exhibit catalog distributed free to State Fair exhibitors. This catalog contains 163 pages. Besides articles by best authorities on many subjects of interest to users of tractors, tractor implements, and accessories, it contains pictures and detailed specifications of 33 makes of tractors, including 57 models, ten different makes of moldboard plows, and nine of disk plows, and various other tractor-driven or tractor-drawn machines.

State Fair Tractors and Implements.

Not quite so many tractors were on exhibit at the State Fair as are available to California farmers, but the farmer who wanted to see a representative exhibit of tractors could see thirty different makes in the two huge tents at the State Fair, with other machinery and implements too numerous to mention outside of a catalog.

Chairs were a-plenty to rest tired feet, but feet didn't get much tired on the soft clean carpet of rice hulls. Ice water was plenty to quench hot thirst, but heat was notably mild during this State Fair. Decorations were most tasty in that they harmonized well, but did not detract from the real exhibits. Uniform neat signs were placed several feet above the green railings surrounding each separate exhibit so any visitor could easily locate the tractor he wanted to see. They were not in the way of a comprehensive look over the whole tent. Practically every exhibit was installed on time.

Notes about individual exhibits appear in other columns. One of the writer's main objects in studying this show was to see what features the tractor of the future will embody. With that in view, we spent many hours talking with exhibitors about the changes made in their tractors during the past year and those contemplated in the immediate future.

Magnetos Almost Universal.

Fewer changes in design were made during the past year than during the year previous, although on one exceptional instance 51 refinements and minor improvements had been made in a tractor. Almost universally magnetos are used for ignition and impulse starters give a hot spark with only a fraction of a turn of the crank. The exceptions to the magneto rule use a well-known system of battery ignition. Some of the starters were equipped specially to prevent kick-back of the engines.

Water Air-Cleaners Coming.

Air cleaners are found on practically every model. The periscope system of reaching up into the air with a pipe to avoid dust has caused the loss of too much time fixing cylinders and bearings ground out by the dust. Most of the tractors now use the centrifugal type of dry air cleaner and the maker of one of these claims that he removes over 99 per cent of the dust before air enters the carburetor. Be this as it may, there is noted a substantial increase in the makes of tractors which use some form of a water cleaner. This develops the highest efficiency except where the tractor driver neglects to empty the mud and keep the cleaner properly supplied with water.

Force-Feed Oil Systems.

It seems inevitable that the tractor of the future shall have a force-feed oil system; and it may be that the oil once used and squeezed out of the bearings into the crankcase will be disposed of without further use.

"In 1850, three hours of hard work with crude plows, hand sowing, cradles, and flails were spent in producing one bushel of wheat. Today, less than four minutes [of work with machinery] produce one bushel of wheat.

"With the hand rake, scythe, flail, and hoe, nine farmers worked hard to produce enough for themselves and one extra family—the city man.

"Today, with our plows, drills, mowers, binders, harvesters, threshing machines, and tractors, the nine farmers produce enough for themselves and twenty extra families—the city people."—Prof. L. J. Fletcher.

Some models now do this, and it seems that such disposal will be especially necessary with kerosene-burning engines. There seems to be great difficulty in avoiding more or less condensation of kerosene in the combustion chamber whence it gets mixed with lubricating oil and destroys its

a combination of force and splash. Some companies seem to be in a transition period, some of their models using one system and some another.

Pumps for Water Circulation.

The thermo-siphon system of letting the heated water rise into the

and fewer are run by belts. A notable fan design is in the one with double blades.

Roller and Ball Bearings.

More of the State Fair Tractor exhibitors emphasized with pride that their machines are fitted with roller bearings or ball and roller bearings throughout, than we found last year. The California dust, which makes efficient air cleaners necessary also makes it desirable to have the most efficient bearings. The demand for a greater proportion of motor power delivered to the drawbar is a greater factor in the popularity of roller and ball bearings. These balls and rollers may be in part responsible for the increase in number of tractors rated on their drawbars at more than half of their motor horsepower.

Working Parts Protected from Dust.

The same dust which insists on other improvements in tractors is also responsible for more enclosed governors, and other working parts. "Absolutely dust proof" is now claimed as an exclusive feature by an increased number of tractor men. Some of them cover their machines to keep the dust off if they can. Others leave their machines undressed and hope the wind will blow the dust off. Very few have any working parts exposed freely to the dust except final drive gears.

Final Drives Mostly Gears.

Final drives have not changed much in the design of tractors now available in California. It seemed a while back that the wormdrive was becoming the ambition of tractor men, but we noted only a few of these at the State Fair. Nearly as many still use the chain drive. A great majority use a gear final drive, and most of these are internal gears.

Tracks or Wheels?

We were asked whether the ultimate tractor would have tracks or wheels. From our present knowledge and observations, there will be two types of the ultimate tractor, one with wheels and the other with tracks. Of the different makes exhibited at the State Fair all but one of the several which are new to California are of the wheel type. That one is a motor truck equipped with tracks instead of rear wheels. But there were new models of present tracktype machines, and more are promised in the near future.

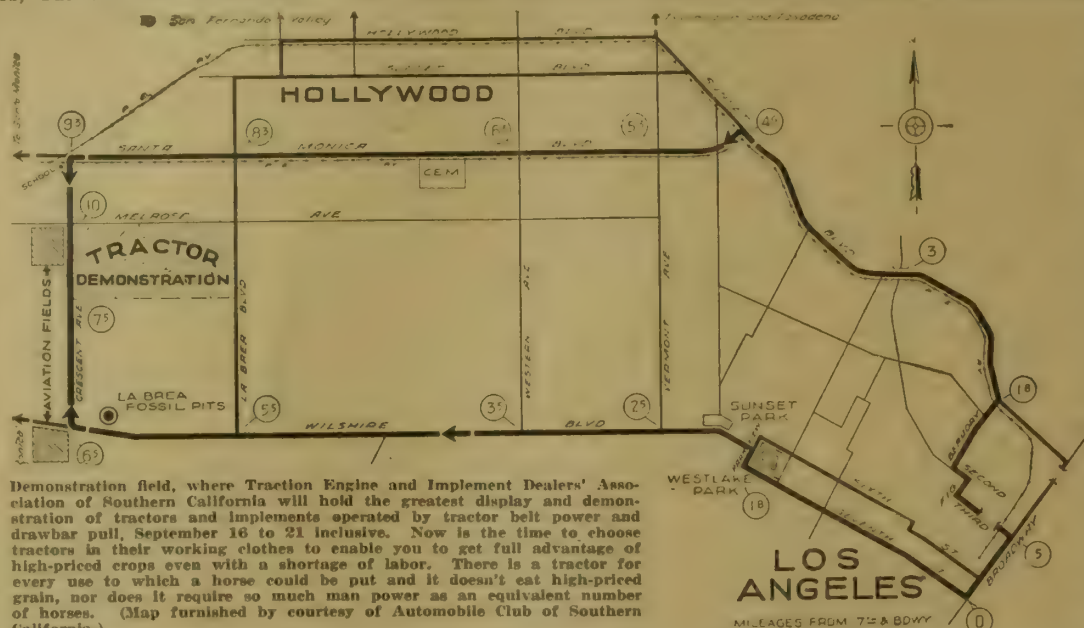

Medium Sizes Predominate.

Three of the largest tractors are holding their ground grimly, but several large tractors of other makes which have been known in California were not shown at the Fair, and generally their makers are not going on with quantity production. At least one of the more powerful machines shown there will soon be off the market. Probably the average-sized tractor now bidding for farmers' favor would have about 12 to 15 horsepower on the drawbar.

Shorter Turning Developed.

Regardless of horsepower, there seems to be a general tendency to avoid width in tractors and to permit greater length. This, however, has not worked against short turning, for the latter feature has been improved by various designs. The automobile system of steering front wheels has become most common and many tractors aid their front wheels by braking one drive wheel or track. Three-wheeled tractors are certainly losing favor, one firm having abandoned this

(Continued on page 360.)

lubricating qualities. The more perfect kerosene carbureters save their engines most of this difficulty, and greater perfection may be expected along this line, for kerosene is the most popular fuel, as judged by the number of tractors claiming to be adapted for it. Only a few tractors now depend on the splash system alone for their cylinders; and fewer were noted this year than last, which have

radiator and flow downward back into the engine as it cools has lost several models, and a great majority of tractors now circulate their cooling water by the positive action of a centrifugal pump usually geared to the engine. Larger radiators or more efficient designs of radiators are being used, the test of efficiency being to avoid boiling the water on hot days. More fans are geared to the engine

4th ANNUAL AND TRACTOR IMPLEMENT DEMONSTRATION

REMEMBER THE DATES AND BE SURE TO BE THERE

Field and Orchard Show at the State Fair

Written for Pacific Rural Press by John J. Fox.

What a contrast was noticeable in the Horticultural Hall between this year and last when the world was busy on war work! Then the show was more or less overshadowed. Furthermore, the hall was less than half its present size. This year the great building was completely filled, and never has such lively interest centered in the exhibits. Not a single county but carried away ribbons on some product and one or two walked away with over 100. It is impossible to give them more than bare mention as a whole, for an enumeration would fill all the space allotted to the writer, and then some—and then no one would read it.

The County Exhibits.

Many of the county exhibits would have excited comment at a world's fair and as for fruit, there was enough on exhibition for a world's fair. The value and demands of Standardization have been thoroughly driven home by the awards of the judges, for some very fine fruit dropped a class through improper marking or poor packs. As a whole, though, the packs may be called excellent in every variety of fruit. The prizes for county booths as a whole were awarded as follows: Yolo, first; Fresno, second; San Joaquin, third; Solano, fourth; then Kings, Placer, Alameda and Humboldt.

Yolo County Still First.

Yolo had the most complete exhibition of the products pertaining to her county grown on a commercial scale. Although each department was kept separate, it formed a well-balanced and unbroken appearance, attractively set forth and well finished. There was no break and there were no ragged edges. The outside of the booth was nicely finished. The fruit, nuts, grapes, dried products, cereals, beans, vegetables and seeds were very complete, carefully chosen and arranged, while a nice inviting alcove looked hospitable to visitors. Bales of home-grown tobacco buttressed the stalls from without and a very complete exhibit of rice from the green heads to the baked bread formed a highly educational demonstration of one of Yolo's important industries.

Fresno's Artistic Exhibit.

This artistic exhibit also displayed a very full and excellent collection, comprising admirable specimens from the county's various products from figs to citrus fruits, from table grapes to nuts. Over 30 varieties of beans were shown and a huge bale of cotton was an added feature. The grapes and peaches were arranged in attractive order well supported and looking fresh and clean throughout the whole fair. This exhibit was of set design and well carried out.

San Joaquin Grows the Stuff.

This county had a real old-fashioned exhibit that appealed to the writer and attracted the eye each time he passed. Its exhibits covered the whole range of this prolific county's

varied products of excellent quality. It was well balanced, yet the products were distinct and separate.

The grapes on one corner were balanced by fruit on the other, the raw edges of the boxes being hidden by green-ribboned paper, setting off the fruit and concealing any crudeness of package. The vegetables caught the eyes at once. They looked natural and appetizing while the cereals and grains covered a large selection. The fibre, wool and forage crops were special features.

Solano Puts Up Attractive Exhibit.

Solano county showed a very handsome range, viewed either from the ground floor or the gallery. A wide frieze running around the cornice of this booth presented pictures of the various productive industries of the county done in grass and seeds. Seventy-five varieties of deciduous fruit were on display, M. Sharp's exhibit of new and imported plums proving a specially interesting feature. Another attraction was the Ramie fibre—raw and manufactured; also a tannery exhibit, showing half a hide big enough to have come from an elephant (almost).

The cereals and grains included a number of new varieties grown in the county.

Kings County Conception.

Kings County's conception represented a ranch with the "Home of Plenty" in the center. The house was very symmetrical and homey and bowery inside. It was covered with milo and gyp corn in the head with shingle-like smoothness of detail. Special features were fine packs of peaches and grapes; also canned fruits and home manufacturing industries—flour and sugar. The strike set this county back in preparation.

Los Angeles Showing a Gem.

Los Angeles county, as usual, had a very finished exhibit of her chief industries—semi-tropical fruits, nuts and vegetables. The whole background, which was supported by beautiful "transparency" scenes was framed to form a large picture. This county was not in competition. She had to bring much of her exhibit by truck from Los Angeles. As a whole this was a little gem.

Tehama county's effort was centered on a very elaborate and well executed scale model of the Iron Canyon Irrigation project, as proposed by the U. S. Reclamation Service. This was a most valuable educational piece that deserves a wide audience. A replica would be useful at some central location where all might see it.

Sacramento County—the Host.

Sacramento county had a large fruit exhibit entirely under glass. The central feature here showed a remarkable collection of packed grape fruit we have never seen surpassed. Another section of this exhibit contained one of the finest exhibits of corn, pump-

kins, watermelons and other field crops with a glowing center of rich red pie pumpkins and squashes. This section had a crowd around it every time we passed. Sacramento county did not enter for competition.

Prolific Placer.

Placer county had an exhibit of fresh fruits well worthy of her productive orchards. Two circular revolving tables built as inclined pyramids, displayed fruits and grapes, while corn, grains, minerals, olive oil and pottery in a well built booth, helped to win her the award she carried away. Her walls were well hung with ribbons on separate entries.

A Mine in Calaveras County.

Calaveras county was very largely a mineral exhibit, though she showed wonderful mountain apples and peaches and other farm products as well. Her exhibit was artistically set out and the booth was built to represent the interior of a mine. This conception was about as well carried out in detail as any at the fair.

Siskiyou County's Minerals.

Siskiyou County had also an exhibition of minerals and mineral waters. There was so much gold here that almost the whole thing had to be stowed away in a safe at night and brought out again in the morning. Not entered as an agricultural exhibit.

Kern County's Natural Riches.

Kern County had a very finished display of processed fruits and vegetables and nuts in glass jars. Her stock industry was shown by illuminated transparent pictures in natural colors, while her vast oil industry was demonstrated by large photographs and an exact model of an oil field equipment banked by samples.

Glenn County's Rice and Fruit.

Glenn County had a fine booth surrounded by Grecian maids at intervals standing in a field of rice. A fountain stood in the center and fruits of excellent quality and pack were on display. The chief features were rice (a crop this year worth \$9,000,000) and almonds, of which there are 1000 acres coming into bearing. This booth seemed attractive, for there was always a little party of visitors seated there chatting to the attendants.

Alameda County's Spacious Booth.

Alameda County had a very wide range of exhibits and given more time could have made much more of them. There were 81 types and varieties of nuts, besides a splendid plate exhibit of pears and peaches. Grains, textiles and manufactured goods, vegetables, jams and canned stuff made up a wonderfully varied exhibit.

Humboldt's Attractions Unique.

Humboldt County, at once the richest and the wildest, the most fruitful and the most mysterious, the simplest yet the most magnificent portion of our great State, was represented by a modest booth in keeping with her nature and traditions. The two cen-

tral features were the splendid plate displays and packs of smooth crisp northern apples without a blemish and the products of the dairy. For her dairies are unsurpassed (except in number) by any county. These two features were flanked with potatoes, and pot plants with a redwood building as a central feature.

The Associations.

The Growers' Associations were well represented, though the Almond Growers' booth outclassed them all in design and attractiveness—it was in fact the outstanding feature of the hall. In justice to the others it must be mentioned that they were asked rather late to exhibit, while the Almond Growers' had a large part of theirs a year ago. We mentioned the other corporation and individual exhibits last week.

The Judges.

The Judges were Dr. J. C. Whitten, Professor of Pomology, University of California, George P. Clements, M. D., agriculturist, Los Angeles Chamber of Commerce, and John J. Fox of the Pacific Rural Press. At the end of the week the Judges were asked to meet with the exhibitors at a conference which proved of great educational value by the questions asked by the latter and answered by Dr. Whitten, Chairman of the Board of Judges. It will serve to give a better idea of preparing for next year's show to many.

It is certain that many counties are sorry they did not bespeak a booth and equally certain that in a year or two the county that does not exhibit may as well take down its shingle. For this State Fair is not alone the greatest advertising medium a county can secure. It also proves of such educational value to exhibitors and such a stimulus to perfection in production that none can afford to stay out.

Now is the time to begin getting ready for next year.

POLLINIZING EVERBEARING STRAWBERRIES.

To the Editor: In the Pacific Rural Press last month M. E. M. complains of his "Ever-bearing Strawberries" being imperfect and not producing as they should. The "Productive and 'Productive and Prolific' ever-bearing strawberries have been grown here successfully for more than five years, and are prolific and perfect as to shape. They are grown at 4,100 feet elevation and at 7,000 foot elevation. The growers here followed instructions, and planted "Kellogg's Prize" as a pollinizer, which seems necessary for ever-bearers. The parties plant a sexual plant beside the ever-bearers and prevent the runners from mixing to prevent crossing of the plants. The Kellogg, as above stated, is what they use.—F. R. S., Bishop.

Fruit Trees

That Produce

PEDIGREED PRUNE TREES

When you plant prune trees, plant the best—trees that will grow, and produce, and pay! We make it a practice to bud our prune trees from parent stock of proven productiveness and quality. The scions are carefully selected by trained experts and the budding is done in the most skillful and scientific way.

Trebla--A New Gooseberry

(Written for Pacific Rural Press by Albert F. Etter, Ettersburg, Humboldt Co.)

When I lived at Ferndale, 60 miles from Ettersburg, I discovered a wild gooseberry of the *divaricatum* species growing in an old pasture. This was in 1893. It was unusually productive, and being interested in such things, I brought cuttings of it with me when I came to Ettersburg in '94.

The climate in Ferndale and Ettersburg differ as widely as does the climate of San Francisco and Fresno. Therefore it is not strange that this "hope" from the wilds of nature was a disappointment. The berries were few and far between and the largest scarcely larger than gooseshot.

Nature an Ally When Man Wishes.

Look for a little moral here and try to follow it in your work, and nature may reward you as in this instance. Not to be discouraged at once, I took the seeds of these tiny offerings in fruit and planted them. In every case they proved hybrids with the Champion gooseberry growing a few yards away. This seedling therefore originated as a natural hybrid about the year 1900.

It began to bear at three years of age and has never failed a crop since. It is extremely robust and will stand more drying conditions than any cultivated gooseberry. Each year it seems able to blossom profusely and regardless of frosts that often destroy the fruit on other varieties. It manages to make a berry for nearly every bloom. These are about the size of red currants and when ripe are a dark purple color. Every twig from the ground up to the top of the bush which is now

about 5 or 6 feet high is full of berries. The bush, though still vigorous, is almost free of spines. It has never suckered from the base like most gooseberry bushes, seedlings as well as cuttings, and from appearance may still live another 20 years.

Long Time Getting Recognition.

The ripe fruit is very decidedly tart. A Trebla gooseberry pie would strike envy in a red currant pie, being just about 100 per cent more powerful in flavor. It is not the common gooseberry flavor at all, and is somewhat between gooseberry and currant. Of all the powerful flavored good pies I ever ate, this berry leads them all. The fact that I could not tolerate such brisk acidity in my gastronomical department is the very reason the public did not hear of this berry sooner. They grew and ripened and the robins ate them just as they did the fruit of their progenitors. The original bush yielded from one to two gallons of berries each season and is the only bush in existence of this variety.

An Al Jelly Berry.

Its points of interest are that it will probably thrive in parts, as it does here, where it is too dry and warm for the red currant; extreme robustness in neglect and making a jelly equal to the best currant jelly. In this line, all we have up to date is the recent test made by Prof. W. V. Cruess of the University of California. He writes under date of June 12th, as follows:

"Have just tested your gooseberries for jelly making. From each pound of fruit we obtained 1 1/4 pints of jelly—a very good yield. It is a beautiful purplish pink in color and of very excellent tart flavor. If this fruit can be grown in quantities, it most certainly has a bright future. I prefer the jelly to loganberry or blackberry jelly, and like it as well as pure currant jelly which it closely resembles."

It is hardly necessary at this time to say that no cuttings are available for distribution, but they will be propagated as rapidly as possible.

THE NORTHERN CALIFORNIA APPLE SHOW.

(Written for Pacific Rural Press.)

This year the only apple show in the State will be held in Humboldt county, October 13-20. Sebastopol and Watsonville are not holding shows this year, but will contribute to this one in competitive as will the Hood River and Rogue River districts. Albert Etter of Ettersburg will exhibit nearly 2,000 boxes of commercial apples (600 varieties) besides his seedlings, seedless apples and pears, Red Cross Strawberry (no hull) and others. Also a Jumbo pear, weighing five pounds, to the fruit, which is grown to be processed and cut up in pieces to be eaten like dates. He has red-fleshed apples and other novelties.

Besides outside contributions, 7,000 boxes of home-grown apples will be shown. Prizes will be awarded for carload lots, 100-box lots, 10-box lots and single boxes. There are five carload displays from five different commercial orchards. All the State is invited to compete.

Humboldt apples will be put on the market as such. They are good keepers and many varieties keep in excellent condition in ordinary (not cold) storage, into February.

Dr. J. C. Whitten, Professor of Pomology at the University of California, will judge the apples. Other products to be shown here include forage and root crops, grass, grains, clovers, nuts, pears, late peaches, etc. Even if there were no show here, the trip to Humboldt county repays the time and cost expended. The man who has never been there doesn't know California.

NON-FRUITING MULBERRY.

To the Editor: I notice that W. M. S. of Biggs wishes to learn of a non-fruit-bearing mulberry. We have one about 45 to 50 feet high with eight branches from the trunk that range from 22 inches in circumference to 44 and 50 inches at four or five feet from the ground. It was planted in 1885. It bears blossoms that drop, though the bees visit the blossoms. We have also about 2 dozen trees that bear berries very heavily of all varieties. We are north of the highway between Vacaville and Dixon, about 5 miles from Vacaville.—Mrs. H. Faugh, Mulberry Farm, R. 2, Box 38, Vacaville.

An apple tree at Findlay (Fresno Co.) more than 75 years old is bearing 32 varieties of apples and six of pears.

MADEWELL

HORTICULTURAL JOTTINGS.

San Francisco was showered with Sun-Maid Raisins from an aeroplane while the gobs were here. Good ad.

Wine grape growers in the different sections are still kept guessing. There is a fine crop everywhere, and quite a few driers have been erected.

Tokays and Black Prince grapes are being shipped from Escalon and Lodi (San Joaquin County). The season has commenced in earnest.

An acreage of 2500 of walnut trees has come into bearing this year, making a total for the State of 77,000 acres, according to W. T. Webber, Sec. of the California Walnut Growers' Association.

Hop prices are climbing. Yakima (Wash.) reports several sales at 54 cents a pound. However, most of the crop had already been contracted—out of a 25,000 bale crop for the State less than 4,000 bales remain on the market.

Large quantities of dried peaches and seedless raisins are now pouring in to their respective association warehouses, which will be taxed to their capacity this season. The fruit is of fine quality.

Every room in the dormitories of the University Farm of Davis has been taken, according to Dean Van Norman, who has advised all new students coming to the University Farm to provide themselves with blankets and bedding.

The Retail Grocers' Association has entered a formal protest against the opening price on raisins in which they signify their intention of discouraging the sale of this product while the price remains so high. A charge of extortion is also made against associated producers of other fruit.

Wine grape growers are making a demand on the U. S. Treasury Department for a rebate on income and surplus profits tax paid during the last three years, because of a substantial decrease in the value of their properties due to the enactment of the Federal Prohibition Act.

The fruit commissioner of Australia has issued a general order prohibiting the importation of oranges from practically all countries except the United States, and then only from California and Arizona. They are known to be clean and safeguarded. This will help gain good prices for early Washington Navels.

The estimated yield of oranges for the 1919 crop is as follows: Los Angeles County, 5,000,000 boxes; Orange Co., 2,000,000 boxes; Riverside, 1,500,000 boxes; San Bernardino, 3,500,000 boxes; Tulare, 2,000,000 boxes; San Diego and Ventura, 250,000 boxes, and Northern California, 150,000 boxes.

Professor C. A. Read, almond specialist of the U. S. Dept. of Agriculture, has arrived and will commence investigational work here under appropriations recently made by Congress for the purpose. He will co-operate with the Almond Growers' Association and the University of California.

The Public Employment Bureaus have been rendering good service in keeping growers supplied with help, and the State Employment Office at 933 Mission St., San Francisco, is continually besieged for aids from the locals. The girls have been more necessary than ever and have done a lot to relieve shortage of men in the orchards.

The Spanish exporters of Almeria grapes are dissatisfied with the outcome of their shipments to the United States because a large number of barrels have been condemned by the inspectors. They contend the inspection is overstrict here and say they have no such trouble in England. But in Great Britain they have no competition, while in American markets they have to stack up against the California grapes and find them hard to beat.

The State of Washington will produce more apples this year than any other State in the Union, according to Professor Brown of the U. S. Dept. of Agriculture. Ten thousand cars of boxed apples are estimated in the Wenatchee district and 8,000 in the Yakima district.

Studebaker

THE 60-H. P. BIG-SIX

IN providing complete motoring satisfaction the New Seven-Passenger Studebaker BIG-SIX offers the utmost in individuality and charming appearance. Its 126-inch wheelbase insures perfectly balanced riding qualities and maximum comfort for every passenger. The 60-horsepower motor with its two-range carburetor and hot-spot intake manifold makes possible unusual speed and power under every driving condition.

Equipment includes cord tires, shock absorbers, tonneau extension light, oval plate glass windows in rear of Gypsy top, genuine hand-buffed leather upholstery, silver-faced jeweled 8-day clock and magnetic speedometer mounted on a circassian walnut-finished instrument board, and many other conveniences.

Studebaker quality, dominant for 68 years is reflected in this new BIG-SIX.

Here and There in the Fruit Business

Early Harvesting of Almonds.

The almond crop will be taken off early, according to the California Almond Growers' Exchange. "The quality so far is running good from all centers and the crop holding out to expectations. It is however too early to predict the total of final deliveries." The Exchange had a magnificent exhibit at the State Fair this week.

A Help to Grape Men.

The Napa growers are feeling a little better this week, said Frank T. Swett, leader of the California Grape Protective League. "We have managed to get the price of grapes raised for them from \$25 to \$27.50 a ton. Ukiah district will get perhaps \$30 for wine grapes for Eastern shipment. It is not much these days of high prices for labor, but it is something and will pay to take the crop off."

The Citrus Growers' Big Business.

After 12 years of advertising (national), the California Fruit Growers' Association has still more extended the sum appropriated annually for this purpose. This year they will spend half a million, in addition to the allotment of \$75,000 for advertising Sunkist Marmalade and a further \$10,000 to push grape fruit. The regular assessment to growers of 2½ cents a box for orange advertising is continued with a fund of \$300,000 set aside. The lemon assessment was increased from 4 cents to 6 cents a box, with a fund of \$200,000 set aside.

The State Land Settlement Board.

At a meeting of the California State Land Settlement Board on the 14th inst, announcement was made that \$1,000,000 was available for buying land, especially for discharged service men. Twelve thousand acres was named as an approximate area for this sum to cover. Applications for allotments now number 1500, two-thirds of whom are civilians. The Board invited offers of tracts of from 4,000 to 7,000 acres. Bids will close October 1. The meeting was called to arrange for the proposed bonding of the State for \$10,000,000 for soldiers Peach Cutting and Canning.

Is now proceeding and the fruit is arriving in good quality. A few early pear consignments were disappointing, according to the canners, because apparently everything had been dumped into the boxes—even windfalls. Prune picking will probably be general the third week in August. The first drop, now on the ground in some places (of Sugars), should be picked up and kept separate for the quality will be inferior and the shrinkage great. The grand campaign on raisins, beginning with seedless, is now near at hand—and we are ready to go right to it.

Selected Prune Trees Make Good.

Robert Britton of Paradise Valley has ten acres of selected No. 1 prune trees seven years old that will run 200 pounds to the tree, all large sizes. He has 30 acres of older trees adjoining and the difference in the size of the fruit is very marked. His brother has a twelve-year-old orchard adjacent which does not come up to this young seven-year-old in quality although he

fertilizes regularly. This young seven-year-old orchard is exceptionally well pruned right from the start—no broken limbs, carries a good load inside and out and has made as much new wood as it ought to. It practically won't need a shears in it this year. Mr. Britton is a strong believer in bud-selection.

Pruning Experiments in Merced.

"For the coming season a definite set of pruning demonstrations are to be carried out in Merced County," says J. F. Grass, County Agent, U. S. D. A. Three or four selected young vineyards will be taken four successive prunings under the guidance of Professors Bioletti and Way of the University of California, with suggestions from local growers. These field experiments and demonstrations will be extended to figs and olives. Also permanent examples of long and short pruning on peaches will be kept and followed. 40 trees will be set apart, the demonstrators pruning two and the growers will prune the rest. Fall irrigation and the establishment of cover crops are other projects in view.

Apricot Yield at Salinas.

P. P. Parker, the enterprising and energetic editor of the "Salinas Journal," breezed into the office this week and reported a 14-ton crop on an acre of apricots on his ranch (which coincided with our estimate). The fruit was of good size and went to the canner. Mr. Parker has some good 'cot land on his ranch and will set out an acreage of apricots on a commercial scale. He has a 20-acre apple orchard on his new purchase that good care will whip into shape as a producer, and he is going right to the bat. He says hundreds of acres are to be set out to almonds, pears and apricots this season in the east side of the Salinas Valley. William Zarala has already planted out some 300 acres of fruit. He is also going to try alligator pears, and will plant more commercial orchards of deciduous fruit.

Nursery Conditions.

From a preliminary survey of conditions it appears that nursery stock is less than last year's supply, partly on account of weather conditions during the spring of last year, which reduced the "plant" on seedlings, and partly due to the big colony and corporation plantings contracted for last year and this. One single corporation is reported to be setting out two entire sections this year (1280 acres).

This year's seedling stand is said not to be so good as usual by two or three men, though we cannot think this was general from weather conditions. The complete shutting off of importation is bound to make a difference in the seedling plants though. For a very large proportion of our myrobalan, cherry, apple and pear seedlings formerly came from Western Europe. Another new departure is the fact that Oregon is now buying from us instead of selling to us as heretofore. Their prices are higher than ours, being now quoted at from \$50 to \$60 per hundred on nursery trees for eastern shipment. There are less walnuts than usual and prunes and apricots are shy.

Think What the *Tube* Has to Do

ALMOST everyone knows, now, that Goodyear Cords are the first choice of the race driver.

For all important track records, from one mile to six hundred miles, have been established by cars shod with Goodyear Tires.

But we wonder how many people realize that this fact is one of the most emphatic endorsements possible for Goodyear Tubes?

No tire, not even a Goodyear Cord, could stand the terrific punishment inflicted by scorching speed unless the tube which it enclosed was irreproachably made.

Goodyear Heavy Tourist Tubes are made of purest rubber—gray gum strips *built up layer-upon-layer* many plies thick, then welded inseparably together into an integral mass.

They are of even heavier construction than usually used in racing tires.

Because of their longer life and their unfailing retention of air, they undeniably do give much protection to casings.

This being true, isn't it essential that *your* tires have the benefit of the finest tubes you can buy?

More Goodyear Tubes are used than any other kind.

GOODYEAR  **AKRON**

Fool-Proof Milking Machine Introduced

(Written for Pacific Rural Press.)

New principles in milking machines which make them practically fool-proof, are revealed by the machine which has at last been put on the market by the De Laval Dairy Supply Co. It has seemed passing strange that this company, so well known all over the United States for other lines of dairy supplies, should have taken so long to perfect and test their milkers. But the principles they claim to have proved, without doubt, were so different from ideas already generally accepted that they had to be sure of their facts before backing the machine with their reputation and service facilities.

Excessive Vacuum Impossible.

With the new machine, milk is extracted solely by vacuum and the pressure pulsations are solely for massage purposes and to give time for elaboration of milk in the cow's bag. The strange feature is that it is claimed that the same vacuum pull will milk any cow however hard or easy she may milk by hand. The writer remembers milking one cow in particular where it took all the strength of two hands to squeeze the milk out of one teat. It is positively asserted that no more vacuum is needed to milk such a cow than to milk the easiest ones. This vacuum is 14 to 16 inches. Less than 14 inches makes sluggish milking; more than 16 inches of vacuum is dangerous. The machine is therefore automatically governed to prevent less or more than 14 to 16 inches of vacuum.

Number of Pulsations Fixed.

Only a part of the milk a cow gives is already in the bag when milking is started. The rest is elaborated from the blood while it is being milked. The De Laval system is to pull the milk every time the blood-pump (the heart) pulsates. This is 45 to 48 pulsations per minute and the machine is regulated to that number regardless of what the operator may think is right.

But if the pulsations originate at a great distance from the cow, air is so elastic and compressible that each

pulsation is merged more or less indistinctly into the next one. To avoid this, the De Laval machine has not only a "master pulsator" at the air pump, but also a "relay pulsator" at the stanchion above the cow being milked. This gives distinctness to each pulsation like a telegraph relay gives distinctness to a long distance message. But even this is not considered close enough to the cow, because rubber tubes compress under vacuum and fill out when air is admitted so the distinctness of the pulsation would be reduced. The final pulsator is located at the junction of the teat cups, within six inches of the teats.

Single Units Only.

The third radical departure of this new machine is that it is manufactured in single units only. This is because it is recognized that many operators leave the double units working on both cows until the last one is dry, thus pulling the one that milks out first after she is dry and causing congestion of blood in the teat and worse results.

One man operates two of these single units at first, and three when he has gained some experience. Often a man wants to milk more cows with two men. To make this economical, the "Pulso-pump," as it is called, is adjustable for two to five units. It is an oil-sealed rotary pump, whose shaft is geared to the pulsator. No change from two-unit capacity to three units is necessary; but for four or five units, the pump is speeded up by reducing the size of its pulley and the pulsator is kept going at the same speed by changing its gear.

Tested a Long Time.

About 250 of these machines in practically the same form as at present have been in use by dairymen for 2½ years or more on farms near enough to the De Laval factory to permit the same factory representatives to keep close watch of their mechanical efficiency and their effects on the cows. Dairymen testify that the cows take kindly to its use.

AVERY TRACTORS

**Do in Hours
Work that
takes Days with
Horses**

Avery Tractors

represent the greatest dollar for dollar value on the American market.

Avery Tractors

are built complete in the AVERY Company's own big plant.

Avery Tractors

are made in eight sizes—a size to meet the requirements of any size ranch, orchard or field.

Avery Tractors

are simple in design and construction and cost less to operate and keep up.

Avery Tractors

are built by a company that backs its products with a reputation and experience of over forty years' standing.

STATE FAIR AGRICULTURAL NOTES.

Green and growing rice was the feature of Glenn county's exhibit.

Vegetables and sheaf grains were prominent features of San Joaquin's exhibit.

One of the best tomato and vegetable collections was that of Yolo county.

A specially good bean variety exhibit with labels was found in the Fresno booth.

Humboldt county surprised visitors with the tall growth and heavy heads of her oats, wheat, and rye.

A ramie plant and fiber exhibit in the Solano county surpriser visitors with the possibilities of this plant.

Early Baart wheat from sandy loam soil without fertilization was shown containing 24 per cent gluten. Baart from sandy loam fertilized by alfalfa which preceded the wheat contained 33 per cent gluten.

The U. S. Forestry Bureau gave away cones and seed of the Sequoia gigantea at their booth, where were shown many of the devices used by forest rangers to protect our watersheds from fire.

The Fish and Game Commission staged a wonderful mountain scene with many colored lights shining like stars in the brook which flowed peacefully below the waterfalls and displayed game fish of many kinds at the feet of visitors.

The Kings county grain-covered bungalow at the State Fair was and included one of the best exhibits shown. Many varieties of grains were labeled in separate containers, while the bungalow was covered with various grains in the head.

Why some seed potatoes are bad and others good was graphically shown in the exhibit of the State Department of Agriculture. Potatoes with various diseases were cut open and an eelworm was magnified about 500 times under a microscope for visitors to see.

Solano county with almost unlimited variety of field crops allowed her small but very important fruit districts almost to monopolize her show. However, amid the popcorn apple orchards, almond-covered dry-yards, and other orchard scenes which decorated the walls, an alfalfa field full of hay cocks made from alfalfa meal suggested her field productiveness.

A feature of the wheat varieties exhibit of the Sperry Flour Company was some Baart from "John Doe's ranch," which looked pretty clean. Mr. "Doe" had been unable to get enough Baart last spring, so he finished planting with seed from his own previous crop. Say, that was a smeller! Smut was most prominent; poor grain and weed seeds made up the rest of that lot.

Along with the Western Soil Bacteria exhibit of legumes grown with and without inoculation was the finest exhibit of new forage plants we have seen. It was furnished by Aggeler & Musser Seed Co. and contained sheaves of Italian rye grass, Australian rye grass, Red-top grass, Russian Brome grass, Merker grass (otherwise known as Elephant grass or Napier Fodder), Rhodes grass, Vioja peas, Australian salt bush, Teft grass, and Natal grass.

SAN JOAQUIN CO. POLAND-CHINA BREEDERS' SALE.

Last call! Forty topnotch boars and twenty bred sows and gilts, nearly all of them either prize-winners at the State Fair this year, or are very closely related to them. The well-known herds of Geo. V. Beckman & Sons, J. F. Lehman, Eugene Miner, Young & Clark, and others that have combined to pull off the first boar sale of the Pacific Coast.

The consignments are of the very highest order and any breeder, either of registered or market hogs that needs either a herd header of foundation stock will make no mistake in attending this sale.

Col. Ord L. Leachman will cry the sale.

No damage to speak of is reported from the rain at this date (Sept. 9). The prune men and others are taking good care of their fruit, which is in most places largely on the trays or housed or else stacked. Some resulphuring of peaches in late districts will be necessary.

The Tuolumne apple crop is above normal, according to Horticultural Commissioner Sherrard. The quality is excellent and several growers received \$75 a bulk ton. Others are grading and packing and netting from \$2.40 to \$2.50 a box. The season is about a week early.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear, and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write AERMOTOR CO., 2500 Twelfth St., Chicago

THE WONDERFUL PERFORMANCE RECORD of

BRAENDER TIRES

Prove them to be without a peer for Speed, Endurance and Economy.

Read These Sensational Victories!

At Indianapolis Speedway, May 30, 1913, established World Record for Tire Endurance. Four Braender Tires carried Ralph Mulford's Mercedes the entire 500 miles without a change. No other tire has ever equaled this performance.

At Sheepshead Speedway, June 14, 1919, smashes record for 10 and 30 mile events, Mulford's Frontenac Braender equipped winning two FIRSTS and one SECOND (1-5 second behind winner).

At Tacoma Speedway, July 4, 1919, Mulford with Braender Tires won FIRST in first race, SECOND in second race. Lowest track record.

At Elgin 300-Mile Road Race, Aug. 23, 1919, Mulford in Duesenberg, carried on Braenders, was leading at 178 miles when compelled to withdraw with motor trouble, breaking the track for 150 miles.

WADE'S New Pea and Bean Thresher

A thresher with a more powerful blower; the air currents properly directed and concentrated; draft controlled by improved damper; larger than ordinary cleaning space with output greatly increased; and perfected sacking attachment, briefly describes the new WADE Pea and Bean Thresher upon which patents are now pending.

Western Made for Western Trade.

This improved WADE Thresher was developed here in the West, where the extreme growth and toughness of the pea and bean vine made slow, and at best, unsatisfactory work, of threshing with the old-style machine.

WADE built throughout.

"Better than seems necessary" construction is carried out in every detail. The price is no higher than on ordinary machines. Post yourself fully on the WADE'S many exclusive features by writing for your copy of the late booklet. Write at once.

State Fair Farm Machinery

(Written for Pacific Rural Press.)

A separate tent at the State Fair was allotted to irrigation pumps, motors, gas engines, and miscellaneous farm machinery, besides the two big tents for tractors, tractor implements and accessories. But the tent did not begin to accommodate all of the exhibits, which overflowed in every direction.

Pumps of Many Kinds.

The biggest exhibit in the tent was that of Fairbanks-Morse & Co., whose 20-horsepower Y engine was running quietly and smoothly on low grade oil. It was hitched to a line shaft on which a Sterling pump was connected. This was discharging into a weir-box up high, making a great attraction. In front of this was a Z engine hanging from a tripod on wires and running steadily. Fairbanks-Morse showed electric motors and other pumps, many models of Hayes fruit sprayers, scales, and a portable elevator for sacked grain. This was run by a gas engine.

The central feature in the tent was a big water tank set in the ground and surrounded by pumps drawing from it and spouting back into it. The biggest pump was a Byron Jackson operated by a Victory Oil motor. This lifted the water way above visitors' heads through ten-inch pipe which ended in an elbow that threw the water straight down into the center of the tank.

Pelton centrifugal pumps of four or five sizes, direct or belt-connected to motors, were ready for business; and one or two were spouting horizontally into the big central stream. One of these pumps was laid out in pieces for visitors to see how they are made. The Taylor-Mayhew Oscillating Pump attempted to run with a five-horsepower Empire engine, but while there is good prospect that the new principle on which this pump is built will be made workable by certain improvements which were indicated at the Fair, the pump tested there will have to be improved.

The Kewanee farm water supply system stood beside the irrigation pumps, being operated by a triple plunger pump driven by electric motors. Outside the tent was a new system of plunger pumping called the "Planetary" system, which was also connected on a windmill or could have been run by gas or electricity. This is described elsewhere.

Hardie and Hayes power and hand sprayers of many models were on exhibit in and around this tent, and Bean sprayers were nearby in the tractor tent.

Farm Electric Plants.

A feature of this State Fair was the large number of small farm electric plants, built to operate all farm lights and such household machines as electric flatirons, fans, washing machines, sewing machines, toasters, etc., etc. One of the best known of these is the Lalley-Light, whose exhibit was in the general machinery tent. A little 1½-horsepower, two-cycle engine direct-connected engine runs the generator which develops about a kilowatt of electric energy and operates a Westco compressed air water system as well as electric lights, etc.

The Delco light exhibit was at its usual stand not far from the entrance to the grounds. Its direct-connected engine and electric system are well known to Fair goers. The Delco washing machine which washes and dries clothes by centrifugal motion attracted a great deal of attention.

The Alamo farm-lighting machine was exhibited with a Duro house-water system in the dairy machinery exhibit. This is a new outfit in California, of 100 and 120-light sizes. Its 1½-horsepower engine is direct-connected to a generator which is claimed to deliver 1¼ kilowatts. The cylinder of this engine revolves within a shell. Port holes are so placed in the cylinder and the shell that they act as valves for intake and exhaust. The ports for firing come opposite each other at the height of compression. The radiator has a float which would short the magneto

and stop the engine if water became too low, and a similar arrangement prevents the engine from running when oil gets low. The outfit stops automatically when the batteries are fully charged.

The Western Electric Co. had a farm lighting outfit of their own, exhibited near the race track, and including washing machine, sewing machine, fan, movie pictures, etc.

The Fairbanks-Morse farm-lighting system is operated by belt from a small low-speed Z engine. It is made in sizes for 40, 65, 100 and 200 lights. A Fairday electric washer accompanied this exhibit.

Pulls 48 Tons by Hand.

In the general machinery tent one of the leading features was the K Handpower, Stump Puller, with which one man exerts a pull of 96,000 pounds. The outfit was stretched between 12x12 timbers set deep in the ground and braced above and below ground. Nine hundred of these machines were sold in July.

Engine Saws Logs.

Outside the tent was a three-foot log from which a Wade gas-engine cross-cut saw was taking thin slices much of the time.

Self-Sustaining Fruit Ladder.

Near the stump puller was a new portable independent fruit ladder invented by Larkin Briles of Modoc County. It stands where it is put without leaning against the tree, and can be put anywhere easily. Its steps swing under a man's pressure just enough to level them at whatever angle the ladder is set. The outfit can be set on a wagon and leaned first toward one row and then toward another. The fruit is, of course, dumped in boxes on the wagon and never has to be set on the ground.

Pipes, Tanks, Culverts, Etc.

Madewell pipe, culverts, tanks, well-casing, etc., occupied one part of the tent. Calco iron tanks, pipes, culverts, troughs, flood drainage gates, Lyman pressure meters for irrigation water, and self-feeders for hogs were found in the Agricultural hall.

The Ashland Products Co. had their governed attachment for the front of a Ford car pumping water with a small centrifugal pump.

The Oil-gas Burner had a fine demonstration of a blue oil flame, steady, silent, and hot. This was in a common cook stove, but other burners for a gas range were connected to the same compressed-air-and-kerosene tank.

Harvesters and Hay Presses.

A Caterpillar combined harvester was displayed in the tractor tent along with the new bean pickup attachment. A few changes in cylinders, screens, etc., convert a regular grain harvester into a bean pickup thresher by means of the new attachment which replaces the reel and draper.

Several Harris combined harvesters for grain and beans were operated by their own engines a great deal of the time at the rear of the machinery tents.

J. I. Case grain and rice threshers were a part of that company's tractor exhibit.

Two great Junior Monarch hay presses attracted much attention in front of the motor truck tent.

Grain Graders.

One of several Rotary Grain Graders in one of the tractor tents continually separated weed and watergrass seed from paddy rice at the rate of 30 sacks per hour with one horsepower and mixed it up again. With suction, it was explained, most of the watergrass seed can be taken out in about five attempts, but still some of the largest seeds remain and reduce the value of the rice. The Rotary has an angular cylinder around which wires are strung like piano wires, just far enough apart to allow the sluggish-moving watergrass seeds to roll and slide along until they fall through, while rice paddy simply hits the wires and bounces along.

THE YUBA—the tractor of highest price and highest quality

The reasons for the price are in the tractor

—In the materials used — alloy steels wherever the life of a part may be prolonged; wherever strength may be increased; wherever the bulk may be reduced.

—In the workmanship — the degree of skill in machining the vital parts; the precision by which smooth-working is assured; the infinite care given minute details.

—In the *ball tread* principle, proved by five years' experience to be unequalled in delivering to the draw-bar the maximum percentage of motor power.

The high price is your guaranty against breakdown, loss of valuable time, big repair bills, annoyance; it insures getting your work done as you want it — and when you want it!

"The YUBA price is the right price for YUBA value!"

There are three sizes of YUBA Ball Tread Tractors: 12-20, 20-35, 40-70

Write us for the catalogue of the size you need; tell us how many acres you farm and the kind of soil

Now is the Time to Buy Your Spreader

A GOOD manure spreader, properly used, will undoubtedly earn its full cost and more on any average farm this year. Besides doing that, it gets you into the habit of fertilizing your land regularly and so building up a soil condition that makes your farm more valuable with each succeeding year.

Everybody expects prices of farm products to be high this year. The market will absorb everything you can raise and pay you well for it. Occasional top dressings of growing crops will increase yields this year, probably more than enough to pay for your spreader, and will also give you even greater assurance of bigger yields next year. Buy your manure spreader now and get busy.

For best results, get one of the light-draft

Corn King — Cloverleaf — 20th Century

spreaders, whichever of the three the dealer sells. All these machines spread beyond the wheel tracks, yet are so narrow they can be driven right into the barn for easy loading. There are three handy sizes, small, medium, and large. Each can be adjusted to do the heaviest spreading ever required, or for the lightest kind of top dressing. The spread is wide enough to dress three rows of corn at once.

You cannot expect land to grow bumper crops on an empty stomach. This year it will pay you well to feed your crops. Buy a Low Corn King, Cloverleaf, or 20th Century spreader now. At harvest time you can charge the full cost off your books and have a spreader that has cost you nothing and that will do good work for years to come. See the local dealer or write us for catalogues.

Trailers Equipped with Air-Brakes

(Written for Pacific Rural Press.)

"In one respect at least the development of trailers has eclipsed that of automobiles, for whereas automobiles are controlled by manual foot-brakes, the latest model trailers are now equipped with air brakes, which operate on identically the same principle as those on railroad cars," declares C. H. Mason of the Los Angeles Trailer Company.

"Not all trailers are equipped with air brakes, but any can now be so equipped if desired. The air is conducted from the truck through a pipe line paralleling the drawbar and the pipe lines are clipped to the trailer frame, extending the full length. The trailer control unit consists of a compact little storage tank and valve mechanism and is pneumatically connected with the control level operated by the truck driver. The air, when applied to the trailer brakes, is drawn from the trailer storage tank and does not pass through the distributing valve and line from the truck. The air admitted to the trailer brake cylinder is exhausted through the trailer valve.

"The connection situated between the trailer and truck operates the same as the air hose connection be-

tween railroad cars, although, of course, of much lighter construction. If for any reason the trailer is disconnected from the truck, the trailer brakes are automatically applied just like a railroad train. The broken air connection automatically releases the air from the trailer tank to the trailer brake cylinder whenever the trailer is disconnected. This permits absolutely safe operation of trailers over the most hazardous roads and gives positive control at all times. Also in going down steep hills a little air applied to the trailer brakes will keep the trailer under absolute control, even to the point of controlling the movement of the truck.

"Efficient hand brakes can be applied to trailers when the trailer owner does not care to go to the cost of equipping with air brakes. These brakes are equalized through the frame so that an even amount of pressure is applied on both drums. Control of the brakes is applied through pull rods and levers and the control is arranged in such a manner that inequality of the road surface will have no tendency to shut the brakes. The brakes can be controlled from the driver's seat on the truck."

DAIRY MACHINERY AT STATE FAIR.

(Written for Pacific Rural Press.)

Dairy machinery never had so big an exhibit at the State Fair as this year, nor so many exhibitors. The great labor shortage was reflected in exhibitors' notions as to what would appeal to the public. Aside from the Simplex and Remco silos, which were erected for inspection close to the dairy cattle sheds, every exhibit contained a milking machine. These included the Universal, De Laval, Calfway, Empire, Hinman, and Perfection, all working and all attracting interested crowds. The De Laval exhibit was most extensive, featuring their new milking machine and Alpha gas engines. One engine with half of its cylinder cut away was being run by another. One engine operated a Viking rotary pump, throwing a big stream of water. An Acme silage cutter was ready for business, and James' barn equipment added to the labor-saving motif of the exhibit.

The California Hydraulic Supply Co. exhibited the Universal milking machine, which also is new on the market since last State Fair. Loudon barn equipment was emphasized; but the newest line being handled by this well-known farm machine supply house was the Alamo farm lighting system and the Duro air-pressure water system. The feature of this, aside from the undoubted advantage

of having electricity for a score of household jobs and electric lights in the rotary cylinder of its engine, which will be described separately.

UNIVERSITY TRACTOR COURSE— SEPTEMBER 16 TO 25.

As registration in the University Farm Tractor Short Course, September 16 to 25, is limited to 180, and as 120 had already registered on September 4, anyone who wants to enroll will have to send their dollar at once to Dean H. E. Van Norman at Davis. The course is held early this time in order to avoid conflict with regular school work. Dormitories at the Farm are all occupied, so your own blankets may be needed. Prof. L. J. Fletcher, who has assisted Prof. J. B. Davidson in all preceding short courses is in charge this year with an enlarged number of assistants. It is the best course, considering the time spent on it by the student, that we have ever experienced.

The All-Work 15-30 wheel tractor is being distributed in California by Grant & Co. of Sacramento since a month ago. This is made by the Electric Wheel Co. of Quincy, Ill.

The Waterloo Boy tractor has been improved by 51 minor refinements since the John Deere Co. purchased the factory.

Power and Light
with the Quiet Knight ★

THE ANNOUNCEMENT of Willys Light has special significance for every American farmer.

Due to limitations of central station service, one of the important blessings long withheld from the farmer's reach was electric light and power. With the perfecting of the individual light and power plant this handicap to farm life progress has been removed.

The Electric Auto Lite Corporation saw the great possibilities of service to the farmer in this invention and concentrated its resources, experience and ability upon a thoroughly dependable electric light and power plant that would completely meet the farmer's peculiar need.

The result is Willys Light!

It gives city comforts for country homes.

The world's largest producers of starting and lighting systems for motor cars,

the Electric Auto-Lite Corporation, in building Willys Light rigidly adheres to five basic principles that must be embodied in a plant worthy of the farmer's full confidence.

It must be simple. It must be durable. It must be efficient. It must be easy of operation and require little care. It must be economical.

Willys-Light has the simplicity of few parts, well made of good material. Significant of its efficiency is its quietly powerful Willys-Knight engine, famed for its improvement with use. It cranks, runs and stops itself. It secures economy by burning kerosene—the cheapest fuel.

With its possibilities for easing the burden of farm life and making it more pleasant and profitable, we take distinct pride in offering the perfected Willys Light as an important contribution to the welfare and efficiency of the American Farmer.

The New 16 valve Twin City Tractor

PAYS BIG DIVIDENDS

For the first time in the history of the tractor industry, the 4-cylinder, 16-valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16-valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last, and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Tractor Improvements Seen at State Fair

(Continued from page 348.)

type within the year and another being about to abandon it in favor of four wheels. In some of the longer wheel types, the front wheels are set back under to give shorter turning radius and greater weight on the front wheels to insure their gripping the earth in turning or in pulling side drafts.

Design and Placement of Cylinders.

Setting motors crosswise of tractors must be done with care to avoid over-width; and but few tractors are built this way. Setting the motor crosswise has its advantages, however, which carry considerable weight with the tractor user. The makers of horizontal cylinders maintain them, and singly, and seems to give greater although they present certain problems which are avoided in the majority of engines having vertical cylinders. Casting cylinders en bloc is less expensive than casting them singly, and seems to give greater steadiness; but repairing or replacement is more expensive if one cylinder becomes cracked from freezing or scored from lack of lubrication or otherwise injured. Most four-cylinder engines are cast en bloc, a few in two pairs, and a few more are cast singly. The latter include big and small machines. Removable cylinder sleeves have been adopted by several tractor manufacturers to avoid expense and loss of time when a cylinder becomes damaged. These sleeves have not all proved perfectly satisfactory, but they seem on the road to commercial perfection and we may look for a greater number of tractors to use them.

Greatest Improvement Is in Materials.

Probably the most notable and universal change in tractors during the past year consists of the use of better materials. This in many cases reduces weight, and in probably all cases it reduces upkeep costs. During the war it was next to impossible to get materials desired or to get uniformity in any materials. That bad feature is clearing away now and manufacturers are quick to improve in this direction. Manganese steel in tracks and track links has made a few good strides in the past year. Tungsten steel in valves to reduce pitting has found additional devotees. Special steel treatments for track links and many other parts of tractors which have developed weakness under abuse are greatly reducing the likelihood of breakage.

Improvements Unavoidable.

In any industry of such vital importance to mankind and as new to the vast majority of mankind as the tractor industry, the first machines are rapidly improved after trial. Where so many minds are working on the problems of an industry as in the tractor business, there will continue for many years to be a multitude of new features tried out and either cast aside or embodied in the ultimate types. It is no discredit to the tractor industry that many machines that have heretofore claimed attention have disappeared. It is no discredit to any tractor to say that some of its features have failed in the short period of tractor development to secure general approval. It may be that some of the models heretofore discredited will be revived with certain changes and become most popular.

Some of the unusual efforts to obtain better traction were absent from this State Fair, though the idea of driving on all four wheels is just as strong as ever with indications that other tractors with four drive wheels, or even six drive wheels, will be shown at the next State Fair. This feature has been so well demonstrated with motor trucks that it surely has practical probabilities with tractors.

Let Manufacturers Do Testing.

With most of the striking variations from common design in tractors, it is well for farmers to keep thoroughly posted, but let the manufacturers pay the cost of trying them out. A farmer has no money to use assisting manufacturers to prove out new fea-

tures when the present features are so well standardized in such a large number of tractors as are available.

There have been improvements and there will be improvements in tractors, but we repeat that the farmer who waits for them will lose more by waiting than he will by paying extra for them when they have been proved.

TRUCKS AND TRAILERS AT STATE FAIR.

(Written for Pacific Rural Press.)

There was a large special tent practically full of motor trucks and trailers despite the assertion of one of our contemporaries that there was no such exhibit at the State Fair. It is to be regretted that the truck and trailer men are not organized to work up as big and representative exhibits as the tractor and implement men had, but the visitor who wanted truck and trailer information could not get through the one tent in half a day.

"A Load Behind Is a Trip Ahead."

Eleven different makes of trucks were shown besides an attachment designed to convert automobiles into trucks. One of the four-wheel-drive trucks was there. About thirty-five different models of trucks were there for inspection and comparison. Four different makes including at least ten different models of trailers and trailer beds were shown.

While these are not a large proportion of all the trucks and trailers on the market, it was interesting to note that six of the different makes used worm gears for final drives, four used internal gears, one uses a chain drive, and one a gear drive. Nine used solid tires, but only one used dual tires. Three were equipped with pneumatics. These facts do not necessarily represent the entire industry.

The most notable change was in the trailers. Practically all of these were four-wheelers, and all except the two-wheelers have automatic steering apparatus of the automobile type. This marks the passing of trailers which wobble all over the road endangering their contents and other occupants of the road. One trailer was equipped with such steering apparatus at both ends, so it could be backed up straight ahead, locking the steering device on whichever end was to be the rear. One trailer has interchangeable tongues, for auto, truck, two horses, or one horse, so it may become a one-horse wagon on occasion.

Trucks exhibited were Chevrolet, Atterbury, Golden West Four-wheel Drive, Sterling, Paige, Oldsmobile, Patriot, Federal, Doane, Diamond T, Traffic, and Browntruck (the automobile attachment). Trailers on exhibit were the Utility, Troy, Reliance, and Trailmobile.

POWER MACHINERY NOTES.

The Bock Tapered Roller-bearing is invading this field as evidenced by the exhibit of the F. Somers Peterson Co. at the State Fair.

The Jessen Gooseneck Cultivator for horses or tractors was introduced at the State Fair. It has no levers and will cultivate close to trees. It is equipped with sled runners in front.

A Moline grain drill 12 feet wide and built for either single or double disks was shown at the State Fair. It was guaranteed not to sag. In the Central West the Moline people have offered \$100 for each kernel found on top of the ground after planting in a well-prepared seed bed with the double-disk drill.

The Bean Spray Pump Co. showed at the State Fair their deep-well multistage turbine pump. They equip a pump with one extra impeller at the bottom for each 15 feet of depth. The water discharges through three pipes between which is the shaft which turns the impellers, operating in the dry. This is oiled at all bearings by a succession of oil cups, each of which overflows into the next lower one.

Cletrac

The Embodiment of Compact Power—

TANK-TYPE TRACTOR

(Formerly known as the "Cleveland" Tractor)

More kinds of work
More days in the year

THE Cletrac Tank-Type Tractor is only 96 inches long, 52 inches high and 50 inches wide. *But in spite of its small size it will do the work of six horses or mules—and has a speed of from forty to fifty per cent greater than the average tractor.*

It is the embodiment of compact power. It produces food but consumes none of it. It never gets tired. Unaffected by heat. It works all day—and all night too if necessary.

More kinds of work, more days

It does better, quicker, cheaper work—and does it *twelve months in the year.*

Plowing is *only the beginning* of its work. It harrows, plants and reaps, binds, threshes and hauls, grades, saws, and fills silos, spreads manure, digs potatoes and does practically all the other jobs formerly done by animal and stationary power.

Can be used on the seed bed

Because of its distinctive tracklaying construction the Cletrac is specially adapted to seed bed work. Eight hundred square inches of traction surface enable it to go over soft plowed ground or moist or sandy surfaces *without sinking in and without packing down the soil*—two invaluable assets not found in the ordinary tractor—two assets essential in the proper preparation of the seed bed.

Ideal for orchard and hill work

The tank-type construction of the Cletrac gives it a tremendous advantage in doing side hill work, or in climbing steep grades.

Its small size and short turning radius enable it to go under and among small trees and are largely responsible for its pronounced preference among orchard owners. A million farmers and orchardists can profitably use the Cletrac twelve months in the year.

An economical tractor—burns kerosene

The Cletrac operates on a surprisingly small amount of gasoline, distillate or kerosene, but is specially designed to use kerosene. It takes less space in your barn than a horse. It eats only when it works.

Sales and Service go together

Our sales and service organizations go hand in hand. Wherever you can get the Cletrac you can get genuine Cletrac service backed up by the strength and reputation of The Cleveland Tractor Company.

Early ordering is essential, as we cannot promise prompt delivery very far ahead. See your Cletrac dealer *now*, or write us for information. We have a very interesting booklet "*Selecting Your Tractor*" that will give you much valuable information on tractor farming. Write for your copy *today.*

Livestock Looms Large at State Fair

(Continued from 1st page.)

various breeds were unanimous in expressing their gratification over the high quality of the exhibit. Mr. Lovejoy, who judged the Berkshires, said that "outside of one ring the showing of this breed in California this year surpassed the one made a week ago at the Illinois State Fair."

Sheep Exhibit Small but Creditable.

The sheep exhibit was really the weakest of any of the old established departments, but had much to its credit for all of that. The Rambouillet exhibit was especially strong, although there was but one exhibitor. There was more competition in the Hampshire classes, but no larger exhibit. Some time California will have a great exhibit of sheep, as some of the early breeders left some wonderful sheep behind them. In fact, they practically established a new breed of which more will be said in the future.

Drafters Draw Attention.

The draft horse, according to the ideas of a great many, is really not of much significance since the advent of the tractors, motor trucks, and good roads. Perhaps the zenith of their glory has come and gone. Perhaps we can get along without them now that we have the good roads, but it still is no uncommon thing to see a truck pulled out of the sand or mud-hole by a sturdy team of drafters, or the hillsides, corners and strips along rows of orchard trees being plowed by the same means. Also in the regions of snow and ice in the winter we still have a friend in the horse who has so long and faithfully served us in the past.

They are not all gone, as could easily be seen by visiting the horse barns south of the main building at the State Fair. Stall after stall filled with the princely Percherons, the massive Belgians and gigantic Shires. Groomed and fitted "to the minute" they were a credit to the judgment and enterprise of the breeders who

still know we have need for the horse in the economics of the farm.

University Farm Exhibit.

It would not be doing justice to our great agricultural college if no mention were made of the wonderful educational and publicity exhibit on the Fair grounds this year showing what they have and what they are doing for the animal industry of our fair State. Beautiful specimens of many of the breeds raised in our commonwealth were shown not for competition, but as educational exhibits. Stabled in a building set aside for the purpose were sleek Shorthorns and Herefords, the handsome and massive four-horse team of Percherons, 4 Percheron spring colts, and 2 yearling Shire colts; 5 breeds of swine, 5 breeds of sheep and 4 breeds of dairy cattle. All were represented by animals excellent in individuality and condition.

Specimens of livestock were not all that were shown in this same line; but also feed racks for sheep; self-feeders for hogs, and in actual use. These devices showed construction that prevented waste of feed and still were very easy to make.

Other devices shown were hen houses adapted to either the city lot or the farm, both of stationary and knock-down type that could be used for housing laying hens or brooder houses.

These exhibits are intended to call the attention of the people of California to what their agricultural college is doing for them. People generally do not recognize the value of the work done by their college and how much can be learned there in a very short time. Neither do all of them realize that the college and farm are their institutions and for their use. The exhibits are publicity exhibits to show and teach how practical and efficient the institution has gotten to be and how much it can help us all if we will only meet them half way.

STATE FAIR LIVESTOCK AWARDS.

DAIRY CATTLE.

Ayrshires.—Exhibitors: E. B. McFarland, San Francisco; J. Henry Meyer, San Francisco; Preston School of Industry, Waterman.

Senior champion bull.—Champion: Holehouse Secretary Imp, Meyer.

Junior champion bull.—Champion: Ayrmont, McFarland.

Senior champion cow.—Highland Itham, Meyer.

Junior champion cow.—Champion: Elkhorn Heatherflower.

Grand Champion Bull.—Grand champion: Holehouse Secretary Imp, Meyer.

Grand champion cow.—Grand champion: Highland Itham, Meyer.

Bull, two years and under three.—First:

Holehouse Secretary Imp, Meyer. Second: Steybrae Improver, McFarland. Third: Steybrae Commander, McFarland. Fourth: Steybrae Masterpiece, Preston School. Fifth: Premier, Preston School.

Senior yearling bull.—First: Preston Prince Banglos, Preston School.

Junior yearling bull.—First: Preston Ravendale, Preston School.

Senior bull calf.—First: Elkhorn Public Opinion, Meyer. Second: Steybrae Monarch, McFarland. Third: Steybrae Master Douglas, McFarland. Fourth: Elkhorn Mariner, Meyer.

Fifth: Preston Masterpiece, Preston School.

Junior bull calf.—First: Ayrmont, McFarland. Second: Ayrmont, McFarland. Third: Elkhorn Royal Review, Meyer. Fourth: Steybrae Robbie Burns, McFarland.

Cow, four years old or over.—First: Highland Itham, Meyer. Second: Maple Leaf Lily, McFarland. Third: Sunnyside Governess, McFarland. Fourth: Curfew Bell 3rd, Meyer.

Fifth: Hancock Favorite, Meyer.

Cow, three years and under four.—First: Torr of Elkhorn, Meyer. Second: Auchinbay Jean 8th, McFarland. Third: Cedar Hill Princess, Preston School.

Cow, two years and under three.—First: Robin's Lucy of Elkhorn, Meyer. Second: Steybrae Jennie Deans, McFarland. Third: Baron's Blue Bell, Meyer. Fourth: Steybrae Ellen, Preston School. Fifth: Steybrae Grace Darling, McFarland.

Senior yearling heifer.—First: Baron's Snow Maid of Elkhorn, Meyer. Second: Steybrae Kirsty, McFarland. Fourth: Preston Dewdrop 2nd, Preston School.

Junior yearling heifer.—First: Steybrae Nona, McFarland. Second: Burnside Miss Courtney, McFarland. Third: Preston Nellie Osborn, Preston School. Fourth: Elkhorn Kirsty, Meyer. Fifth: Preston Princess, Preston School.

Senior heifer calf.—First: Elkhorn Heatherflower, Meyer. Second: Ayrmont, McFarland. Third: Ayrmont, McFarland. Fourth: Steybrae Edna, McFarland. Fifth: Elkhorn Snowflake, Meyer.

Junior heifer calf.—First: Elkhorn Thistle-down, Meyer. Second: Steybrae Gem, McFarland. Third: Steybrae Alta, McFarland. Fourth: Preston Soney Maid, Preston School.

Cow having official yearly record.—First: Willowmoor Vista 4th, McFarland.

SHARPLES SUCTION-FEED CREAM SEPARATOR

IT SKIMS CLEAN AT ANY SPEED

You can "rest up" as you work, turning slowly and easy-like.

Or you can turn faster and finish quickly.

But no matter how fast or how slow you turn the Sharples, you'll find that the cream hasn't varied a bit in thickness, nor have you lost a particle of butterfat through turning under speed.

This is due to the Sharples Suction-feed principle. No other separator can use this principle as it is patented. All other separators are fixed-feed and when you turn fast your cream thickens, and when you turn below speed you lose butterfat.

Official tests made by nearly all agricultural colleges have proved that the Sharples skimmed clean at widely, varying speeds—without affecting thickness of cream at the varying speeds. Write for full report.

The Sharples Separator works with you as well as for you.

Get the facts about separators. They will show you the way to greater profits. Write to nearest branch, addressing Department 31

"There are No Substitutes for Dairy Foods"

DC 95

HOLSTEIN COW EARN'S MOST

for \$100 worth feed. Do your cows earn 50 per cent on your feed investment? Any purebred Holstein or good grade will do that easily, as figures compiled by Hoad's Dairyman show. Taking the average from 19 herds of purebred and grade Holsteins, owned by patrons of a creamery in Jefferson County, Wisconsin, it was estimated that for every dollar (\$1.00) spent in feed, \$1.54 was received from the creamery. Unless your cows do as well, they are wasting their feed.

Farm and Dairy Equipment

"Less Labor" "Bigger Profits" "Better Work" "More Comfort"

Invest some of this year's fine profits in better equipment that will not only help to produce a big season next year, but that will add comfort and pleasure to your living this year, next year, year after, and through all the years that lie ahead. We specialize in modern equipment for farm and dairy; and handle more

lines of farm machinery than any other farm equipment concern on the coast. Our years of experience are at your command. Write us about any of the equipment described on this page, or any other equipment in which you may be interested. Every inquiry answered promptly and fully. **WRITE TODAY.**

"DURO"

Deep Well Systems

JUST the thing to bring suburban or country home right up to date.

Pumps water from wells, where depth to water level ranges from 22 to 150 feet, and supply it under pressure for all purposes about the house or grounds.

"Built like a battleship," economical and entirely automatic in operation.

Send for Duro booklet

AMERICAN PUMPS

We are distributors for American Standard Horizontal and Vertical Pumps—and Turbine Centrifugals.

They're the best pumps on the market. They cost a little more—but last longer and are decidedly cheaper in the long run.

American Pumps are famous for their large capacity and high efficiency.

We also have special pumps for direct connection to motors.

Write for Pump Catalog.

LOUDEN FEED AND LITTER CARRIERS

With a Loudon Carrier, one man can do the work of four with wheelbarrows—and the man with the Loudon will be less tired, at the end of the day.

That's the way to keep your help and cut your labor cost. The dairymen who make money are the dairymen who use modern equipment like this.

SEND FOR LOUDON CATALOG AND FREE BOOK OF BARN PLANS.

UNIVERSAL Milking Machine

With a Universal outfit one man can do the work of three, thus actually eliminating the work of two men. You can solve your labor problem, save time and inestimable hard work, and do the milking better with a Universal.

Milks with alternating action, massaging and relieving two teats while the other two are being milk—the natural way. Fits any cow.

WRITE FOR UNIVERSAL CATALOG.

ENGINES in All Sizes

We have engines in every type and size—from 2½ H. P. to 100 H. P., operating on distillate or low grade fuel oil. Our lines include Western, Faultless, and Muncie Oil Engines. We'll show you how to get the most power and the best results at least cost—and that's what you want.

California Hydraulic Engineering & Supply Co.

68 FREMONT ST., SAN FRANCISCO.

420 E. THIRD ST., Dept. A, LOS ANGELES.

Save \$5 a Day While You Make Hay!

When help is scarce and high priced, and all the horses are needed in the field, the Loudon Power Hoist comes to the rescue. Does the work of both a team and a man, and does it in half the time.

There's nothing complicated about the Power Hoist; it's just a plain, common-sense, sturdy machine, built to handle big loads easily, and to save

time and labor in hay harvest. Can be used with any kind of power. Anybody can operate it.

Try it out this season.

ALAMO Electric Light Plant

Most efficient plant of its kind on the market. No vibration. No noise. Solid, substantial, highly perfected. Will give many years of service. **WRITE FOR ALAMO BOOKLET.**

THE EXHIBITION OF LIVE STOCK AT THE FAIR.

(Written for Pacific Rural Press.)

As the Fair progressed and the live stock judging was finished, the hopes of some were realized as well as the fears of others, then came the chance of each and every one to learn. The veterans always absorb more or less unconsciously the whys and where-fors of their winnings and also of their losses. The young exhibitor has perchance his hopes too high and finds them dashed even lower than the ground. Then comes his great chance for learning. Perhaps his animal was not fitted as well as it should have been or overfitted. Maybe it was handled in the ring in the best manner. He should be in a frame of mind that will permit his accepting defeat gracefully and coolly and studying the proceedings from all angles. If he will do this he has started right, and will eventually come to be a great breeder and showman. The herdsman and shepherd becomes expert in always presenting the best side of their animal to the judge in the ring in a perfectly legitimate and honest way. This is all right as long as deceit is not practiced. The career of a tricky man in the ring sooner or later comes to a point where he loses the respect of his competitors and his value as a herdsman or stockman.

There are certain methods of preparation of animals, however, that are recognized as legitimate and standard, such as trimming the medium-wooled sheep, dressing the Merinos with oil and coloring matter, oiling hogs, polishing and waxing horns of cattle and using clippers to bring out the quality, etc. Such things are legitimate and simply give an added bloom and luster to the animal and deceive no one.

Properly carried out the growing, fitting and exhibition of live stock in all its classes is almost or quite a profession in its perfection. It is a profession or employment that is a remunerative and pleasant one for one who follows it as a calling. It is doubly so for the stockman who grows, fits and shows his own stock.

LIVE STOCK JUDGES.

The men who performed the somewhat arduous task of placing the ribbons on the different classes of live stock at the State Fair this year are as follows: John C. Burns, College Station, Texas, draft horses and beef cattle; E. A. Trowbridge, Columbus, Mo., horse show; Hugh G. Van Pelt, Waterloo, Iowa, dairy cattle; James F. Wilson, University Farm Davis, sheep and goats; Dwight Putman, Tecumseh, Neb., Duroc Jerseys; Thos. A. Shattuck, Hastings, Neb., Poland Chinas; Wyman Lovejoy, Roscoe, Ill., Berkshires; Prof. J. T. Thompson, University Farm, Davis, Chester Whites and Yorkshires.

SHORTHORN BREEDERS' BANQUET.

Certainly the men of this association outdid themselves in their banquet at the Travelers' Hotel on Thursday evening of State Fair week. After partaking of the feast, Toastmaster C. N. Hawkins introduced B. O. Cowen, formerly Assistant Secretary of the American Shorthorn Association, who gave a very pleasing and instructive address on the origin of the Shorthorn, and proving in a very logical and convincing way that his favorite breed was by far the most ancient of any of the breeds.

Following Mr. Cowan, Mr. Glide, Prof. True, Mr. Troup and others gave short talks on the Shorthorn as a breed and other relevant matters. No business was transacted of importance.

Thos. Harrison of Santa Rosa reports the sale of his Grand Champion Dual Purpose Shorthorn bull, Foot-hills Pioneer to Leon F. Douglas Geyserville for a price that runs well up in four figures.

Estimated attendance by the Board of Directors at the State Fair this year is 150,000. All debts are paid and \$6,000 remain in the treasury.

THE BERKSHIRE DONATION SALE.

This sale, held immediately after the judging of the Berkshires at the State Fair this year, for the purpose of filling the treasury of the Western Berkshire Congress, was a pronounced success. The top of the sale was the bred gilt Castlevew Lady, consigned by J. Francis O'Connor of Santa Rosa. She is a particularly good animal, smooth and stretchy, bred to Baron Rookwood 2d, son of the \$1100 Grand Champion boar of the National Swine Show, and out of Rookwood Lady 100th, Grand Champion sow of America. Mr. A. B. Humphrey of Escalon thought she was good enough to place in his herd and paid \$200 for the privilege.

The average of the sale was \$64.86, including all consigned, among which were several young boar and sow pigs. These materiallv reduced the average, but the total of the sale was sufficient to put the "Congress" on "easy street" for some time to come.

POLAND-CHINA BREEDERS.

Everyone that classes himself in the above list should not fail to attend the bred sow and gilt sale of John M. Bernstein and W. L. Haag & Son at the Kings County Fair Grounds, Hanford, on September 17th. Both Eastern and Coast bred stock will be offered and of the type and breeding that every up-to-date Poland-China breeder is looking for. Sows bred to The Yankee Jr. and Lendorris Libery Bond—two sensational young boars of ultra fashionable type. Do not miss this sale.

HOLSTEIN BREEDERS AND DAIRYMEN, ATTENTION

65 Head Registered Holstein-Friesians

Combination Sale

Henderson Co.

Bonita Stock Farm

STOCKTON, CALIFORNIA

Thursday, September 18th, 1919

Young bulls sired by and cows and heifers bred to the great King of the Blacks and Whites, who has more A. R. O. daughters to his credit than any other sire on the Pacific Coast; King Pontiac Segis Inka, son of King of the Pontiacs; King Lillian Walker Segis; Supreme Glista Pielje, a 32-pound sire and sire of the junior champion bull at the State Fair this year.

Winings of the Henderson Co. Holstein Herd at the State Fair this year included one championship, four firsts and other awards in the strongest competition ever offered on the Pacific Coast.

Females offered are either just fresh or bred to one of the above sires. Bulls in the sale are very fashionably bred and out of A. R. O. dams.

No animal in sale tuberculin tested.

Sale at Darby's Barn, corner East Jefferson and Pilgrim Sts., Stockton.
Cattle on exhibition two days prior to sale.

AUCTIONEERS: COL. BEN A. RHOADES, Los Angeles.

COL. GEO. W. BELL, Tulare.

3½

You Buyers of 3½ Inch Tires

You represent over half the tire buyers of the world. You deserve special consideration. Your volume of demand calls for the biggest value.

Recognizing this, Firestone has built a special \$7,000,000 factory for you, designed special machinery for your tire and special looms to weave your fabric.

And this factory is operated by an organization devoted entirely to your requirements. The methods and machinery leave no room for errors or flaws. Result: This special molded tire is the nearest thing to a perfect tire that engineering can give you.

By saving from 10% to 30% on every factory operation, you get this tire at a price that some pay even for the "off brand" kinds. 30x3½, non-skid, \$18; 32x3½, non-skid, \$21.

You get a 6,000 mile adjustment basis, and you get it from Firestone—always in the front in value-giving and now years ahead of the field. Any one of the 42,000 dealers who bank on Firestone quality will put these money-saving tires on your car.

Chamber of Commerce.

A hog has no interest in your profits

He roots the grain you pay good money for—scatters it all over the ground—that is, if you feed in the old way.

Install Calco Automatic Grain Feeders—and note the saving in grain and money. Modernize your equipment.

This feeder is made for your hogs. The grain is automatically fed to the feeding trough. The feeder is light, easily moved, and sanitary.

In some models, V-shaped compartments make possible individual feeding of small hogs—and prevent rooting.

Send for folder and prices—learn how a small investment in Calco equipment will save in the cost of feed.

Fat barrow.—First: Unnamed, Bassett. Second: Unnamed, Bassett.

Pen of fat barrows.—First: Bassett.

HENDERSON HOLSTEIN SALE.

Breeders of the "Blacks and Whites" will have an opportunity on September 20th at Stockton of purchasing at their own price individuals from 65 head listed from the Henderson and Bonita Stock Farms. Many

of those in the sale closely related to the King of the Blacks and Whites, with more A. R. O. daughters than any other bull on the Pacific Coast. Also the senior herd sire at the Bonita Ranch, Supreme Glista Pietje, sire of of Bonita Sir Cornucopia Glista, blue ribbon junior yearling bull at the State Fair this year, is also closely related to many consigned.

The H. C. L. is receiving so much of our attention at the present time that every chance to improve our methods of production of milk, one of the necessities, should not be overlooked. This sale is one of those chances to

procure animals of the very highest economic production in the breed and any one interested should not fail to attend the sale and buy some of this great offering.

Clyde Horr of Susanville was at the State Fair with an excellent herd of Poland-Chinas. Mr. Horr has the distinction of having the first exhibit of registered livestock at the State Fair from Lassen county. His sow, Horr's Big Orphan, was placed fifth in a very strong class. Mr. Horr knows there is a great future for blooded livestock in his country.

HAVE SOME NICE YOUNG BULLS

Sired by SIR VEEMAN KORNDYKE PONTIAC

and from A. R. O. dams for sale.

ALSO A FEW CHOICE POLAND-CHINA BOARS.

R. F. GUERIN,

Visalia, Calif.

We distribute only about 6 per cent of the country's butter, eggs and poultry

Only about 12 per cent of the meat of the country is dressed by Swift & Company

Our tanneries make less than 15 per cent of the hides into leather

Compared to the entire industry, our business is small

The United States produces an immense amount of meat.

Swift & Company does a big business, but compared to the nation's total, our output is small. It is like comparing one big apple to a whole tree of fruit.

We handle only about 12 per cent of the dressed meat of the United States. There are 302 national packers and 944 local ones competing with us.

We distribute only about 6

per cent of the country's butter, eggs, and poultry.

Our tanneries handle less than 15 per cent of the hides made into leather in the United States.

Our soap factories make less than 10 per cent of the soap output.

Compare these small percentages with the proportions handled by large corporations in other industries, and you can easily see that Swift & Company is not so large after all.

Swift & Company, U. S. A.

Founded 1868

Poultry and Rabbits for Profit

POULTRY AS A SIDE LINE.

Do you want to make poultry an important side line on your farm by looking after them in the right way? Here are some of the features of a successful poultry plant down Tulare way:

Roosts.

Roosts are kept entirely separate from the walls, because when they touch the walls a regular path is made for ticks and other vermin, from roof and wall to resting hens.

Instead, 4x4 posts are sunk firmly in the ground in two rows, with slits in them in which a 1x4 will fit. These 1x4's have also grooves 12 inches apart in which 1x1½ roosts fit. In housecleaning a man can walk along quickly, taking up the roosts, then taking up the side boards, putting them out to air, and cleaning the floors up in no time. Some heavy oil, or grease, dropped in these grooves occasionally prevent vermin of any kind from hiding in them or passing through them. This is an extremely simple and convenient arrangement.

You might not think that such small roosts could hold up a lot of hens. They do so easily on account of the strain coming on the long side; if they were laid flat two hens on the middle might break them. As it is there is a span of six feet between supports and all the Leghorn hens that get on them cannot break them. The roosts project six or eight inches over the sides.

Nests.

Tightly stretched woven wire is slanted over the nests on the north walls. This prevents the hens from standing on the top boards and leaving their droppings on them, which would cause vermin. At night a 1x4 is slipped in front of the nests, which prevents the hens from roosting in the nests. If they tried to do that, mites, lice, and ticks would gather.

Miscellaneous Pointers.

Given a large flock of Leghorns and they will range over a 40-acre ranch. Consequently a large flock on free range does not go on a 10-acre farm, unless the neighbors are obliging. When grasshoppers are abundant the hens will not range far; when they are scarce, they will range farther.

A collie dog is a convenience on a ranch where hens range wide. It is the nature of the breed to protect the creatures he is with. A collie dog on the George ranch rushes out and under every hawk or buzzard he sees overhead, and it keeps them off. The buzzards do not notice the dog; the hawks either fly off, or try to dive at some other part of the ranch. It takes some time for them to work around to that plan, so if they do not fly off right away, Mr. George waits for them with a shot gun and then they give up chicken-killing forever. A shepherd dog, owned before the collie came, was just as good at the same work.

The time to kill a hen in her last season is when she starts in to want to set during the summer. If broken up, it will be quite a while before she begins to lay again, and mostly she will begin to moult first, so put her on the market before that happens, while she is still marketable and before a lot of valuable feed is wasted on her.

Unless there is lots of irrigation water a person has to be careful about putting poultry manure on land, according to Mr. George. He used to put it broadcast on his alfalfa checks, but found that it burned the ground (which it would not do if irrigation was heavy), so now he dumps it in the ditches, and the water distributes it all over the ranch and there is no burning at all. Orange growers are willing to buy the manure at \$7.00 per ton. Chemical analysis would probably show that it was worth double that price.

A scratching shed 14x36 is in large enough for 600 hens, according to Mr. George. He has his house board-

ed up a foot off the ground to keep in the straw, and feeds all of his grain in straw. The roof alone will not give enough protection from the sun in the middle of the day when the hens are loafing, but he boarded up two sides, which prevents the hot wind from passing through, and now the hens think it gives grateful shade.

"Swat the rooster" is the slogan for most farms. You do not hear it much around Tulare, for the roosters are all swatted before they are roosters. Nearly everybody buys baby chicks to raise. There were 75,000 sold by Poultry Association last season, 50,000 were turned out by a local hatchery, others imported chicks directly, and as is customary incubators and even setting hens were vigorously on the job on lots of ranches.

SWOLLEN EYES AND BLINDNESS.

To the Editor: We are having trouble with our chicks and wonder if you can give us advice. For feed our chicks three months old are getting wheat and barley, whole grain twice a day; and a dry mash is in front of them all of the time. Mash contains bran, charcoal, beef scrap, cracked corn, rolled barley and alfalfa meal. They also get some sour milk. They are at liberty to range at will. But we are continually finding them with swellings about the eyes which eventually blinds them and they soon die. Be kind enough to tell us what is the trouble and suggest a remedy.—J. R. Washburn, Oakdale.

Apparently these growing chickens have a simple cold that has become chronic, and as they do not see well they die more from starvation than from the cold. The trouble may have originated in the sleeping quarters and be due to drafts created by cracks in the sides of the house; or the quarters may have no ventilation and when they go out of the house in the early morning they are chilled by the great change of temperature. If the quarters are properly constructed, with abundant ventilation on the front only, it is possible the chickens are in the habit of crowding or "stacking" into one corner which causes them to sweat and they continue or intensify the cold each morning as they separate from the heated mass. Red mites also produce similar results if the quarters are overrun with them. The eyes may be washed and opened by the use of witch-hazel or a solution of permanganate of potash; this treatment will enable them to eat and drink. A liberal dose of epsom salts in the feed or water, or both, helps to cleanse the system. It requires patience and some experimenting to get chickens over the stacking habit. Frequently it may be accomplished by placing in their favorite corner a frame covered with burlap. For fowls three months old the legs should be about six inches high and the burlap tacked so the center of the cloth will be about three inches from the floor.

TO DETERMINE A FRESH EGG.

The absolutely fresh egg held against the light says an exchange, shows a distinctive pinkish glow of goodness. Let the egg, however, remain out in the sun or in the summer heat for a little time, and within a day or two it begins to show blood, a tiny series of little blood vessels forming around the embryo of the chick; or the heat may cause the yolk to go toward the top and shift easily which characterizes it as a "light floater."

Again, the yolk may mix with the white and make a "white rot," a condition also revealed by the candle. The final stage is the "black rot," where no light at all can be seen through the egg. The egg has now reached the explosive stage, which makes it such a favorite missile of the average boy. There is, however, another type of bad egg which most

people would think good for food. The yolk is a firm golden ball and the white a clear liquid. But the white has a greenish color—and the green indicates that the egg is full of bacteria—it is a "green white egg."

BOOKING FOR WINTER, SPRING DELIVERY

Most Fall Chicks Already Booked. yet hundreds open most weeks, reduced, in each of seven popular breeds. Clearing customers, \$5 yearly. 200-250 egg strain. Large vigorous winter layers. Half chicks go to former customers. Doubling our 70,000 hatching capacity. Returned thousands of dollars for chicks we couldn't supply. FEW HUNDRED BREEDING HENS, MALES, laying younger pullets, going rapidly—50c to \$2.00 under price. Valuable circular with proof free. J. Beeson, Pasadena, Calif.

PEERLESS WHITE WYANDOTTES—Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels, 100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

S. C. WHITE LEGHORN CHICKS—by the 100 or 1000 from A-1 Hoganized and Trapped stock. Won 1st, 2nd and Special (Utility Class), Oakland and Modesto. Order early for Fall and Spring delivery. A. O. & P. M. Forster, 2918 Otis St., Berkeley, Cal.

FOR SALE—About 135 pair of pigeons, mostly Carneaux, some white Kings and Homers. All fine stock and in good condition. Must sell on account of leaving. Price, \$1.50 per pair. Address Frank Knolle, Vineburg, Calif.

FEBRUARY BARRED ROCK PULLETS—A few dozen especially good birds from extra large, heavy laying parent stock, for sale at \$2.50 apiece, crated and delivered at station. Also March Leghorn pullets at \$2.00 each. Geo. L. Horine, Winton, Calif.

GET BABY CHICKS NOW—Write for free booklet on fall chicks. See why they pay. Several varieties very week. Only good, strong youngsters shipped. Stubbs Poultry Ranch and Hatchery, Box 87, Palo Alto.

EASTMAN'S BRED TO LAY—Hoganized and trapped Barred Poultry Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

PETALUMA HATCHERY. Can ship day-old chicks to points reached in three days. Four varieties. We challenge the hen, or anybody else. Free fall circular. L. W. Clark, Petaluma, Calif.

FALL BABY CHICKS—Rocks, Reds, and White Leghorns; choice stock. Place your order in advance to insure prompt attention. Santa Clara Valley Hatchery, San Jose, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Vadden, Box 3, Los Gatos, Calif.

WRITE FOR SPECIAL PRICES on Fall chicks. Willow Glen Poultry Yards, 10 South Lincoln Ave., San Jose.

ROCK, RED OR LEGHORN baby chicks—large or small lots. Right prices. Madera Hatchery, Madera, Cal.

FALL BABY CHICKS from our large heavy-laying S. C. White Leghorns. Send for prices. Tupman Poultry Farm, Box 7A, Ceres, Calif.

GOLDCROFT BUFF ORPINGTONS—Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

CHICKENS, DUCKS, GOOSE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

HOW

The Paraffine Companies Inc. helped develop the oil and asphalt industry of California

The tremendous growth of the oil and asphalt industry of California was due in a measure to The Paraffine Companies, Inc.
How?

"Black Paraffine" Apparently Worthless

In the early days, oil experts from the Pennsylvania fields, thought that the black viscous residue left after the lighter oils had been distilled from California petroleum was "black paraffine." But it was not like the paraffine they knew, and they considered it worthless.

For a long time the oil industry was handicapped by the large quantity of this black residue.

Its Great Value Discovered

Then came Beardsley, an Eastern oil expert, and Pierce, a chemist, who resolved to find a use for it. They experimented ceaselessly without result, until one

day by accident they discovered that this "black paraffine" would dissolve readily in that evil-smelling liquid known as carbon bisulphide. Their search was at an end. They had made a paint which dried quickly and withstood the action of acids and alkalis.

As a result of this discovery The Paraffine Paint Company was formed to manufacture the now famous "P & B" paints and a small plant was established in Oakland in 1884.

Oil Was Distilled to Get the Asphalt

During the early life of The Paraffine Paint Company there was difficulty in securing enough "black paraffine," or what was later discovered to be asphalt. The oil companies had trouble in supplying it, because it forced them to distill a large quantity of the lighter oils in order to get the residue. And, they stated, there was little or no market for the distilled products! Thus, for a time, asphalt was the main product and the lighter oils the by-products. A curious situation in the light of present-day conditions.

Growth of The Paraffine Paint Company

Through the company's success in making paint, other uses for asphalt were sought and found, and it gradually extended its business. New products were brought out from time to time, such as "P & B" roofings—the original ready roofing—building papers, specialty paints and wall-board, and later, floor coverings.

The Paraffine Companies, Inc., Organized

Built upon a solid foundation and a policy of high quality always, the Company grew and expanded until in November, 1917, The Paraffine Paint Company with other companies was merged into The Paraffine Companies, Incorporated. Today this organization is one of the largest industrial concerns in the West and the products of its fourteen great plants are distributed throughout various parts of the world.

Everybody on the Pacific Coast who has ever had anything to do with building construction knows the names of the "P & B" products, Malthoid and Ru-ber-oid Roofings, as the standards of ready roof-

THE HOME CIRCLE

I HEAR THE SEA.

When night has let her curtain down
And darkness shuts the world from
me,
In yonder little fisher town
I lie and listen to the sea.

My windows open to the strand,
I hear the sounding waters roll;
They beat the rocks, they wash the
sand,
Their breakers cross the lighthouse
mole.

And all the night, against the shore,
I hear their beat but have no fear;
'Tis not alone the ocean's roar,
It is the voice of God I hear.

Forever thus, O sounding sea,
The years perpetual come and go;
Across life's bar they call to me,
As constant as the ocean's flow.

And so it is in yonder town,
When darkness falls across the lea,
Where fisher folk go up and down,
I lie and listen to the sea.

—S. H. M. Byers.

THE ROD OF GOLD.

Once upon a time an old woman,
who had been walking through a
wood, came at last to the open coun-
try beyond. Just before her flowed a
stream which she must cross on her
way. She seemed feeble, and, when
the bank of the river was reached,
she stopped in dread; for the current
was swift and the stones were slip-
pery and unsafe. She glanced about

her at the trees, for she must have
help. A great oak stood near with
its beautiful leaves and many acorns.
"Kind oak," said the old woman, "may
I have part of one of your branches
to make a rod to help me over the
stream?"

"Indeed, no," cried the oak. "I can
not spare a single branch. My acorns
are far too beautiful to give away."

Then the old woman went to a red
maple standing near the oak, and said,
"Will you be kind to me and spare
me a branch from which I may make
a staff to carry me over the river?"

"Of course not," said the maple.
"Could you imagine I would spare any
of my beautiful red leaves?"

The old woman turned sadly away.
A chestnut-tree stood near, and she
appealed to it. "Good chestnut, may
I have one of your branches?" she
asked. But the chestnut-tree could
not spare a single nut, and so refused.

The sycamore thought her balls too
pretty to part with and the poplar
stood tall and disagreeable and would
not help her.

The elm drooped languidly, and told
her she might ask the walnut. And
so it went; hickory, ash, horse-chest-
nut, and birch-tree all said, "No," till
the poor woman, quite discouraged
and tired out, sank on a great stone
to rest and decide what was best to
be done.

At her feet lay a stick, old and dis-
colored, but straight and strong. It
spoke to the old woman, and said,
"I'm sorry the beautiful trees have
been so unkind to you, and I will help
you gladly if I may. You see I have
no beauty; I do not even know to

what tree I belong; I have no acorns
nor nuts nor leaves, and even my bark
is gone; but I am strong, and will
gladly take you over the stream."

The old woman picked up the poor
rod at her feet, and, leaning heavily
upon it, started on her journey across
the river. The water roared about
them, but the rod bore her in safety to
the other side. When the farther
bank was reached, a wonderful thing
happened. The long cloak worn by
the old woman fell away, and there
she stood, not really an old woman
at all, but a beautiful fairy. "I am
the fairy of the woods, kind rod," she
said. "I came to see if my trees were
kind as well as beautiful. You have
done all in your power for a feeble
old woman. Now what can I do for
you?"

The rod replied, "I should like to
be beautiful, but most of all I want
to be loved, especially by the chil-
dren."

"You shall have your wish," said

the fairy. "You are worth your
weight in gold, but the rod of gold
would not be loved by the little ones.
I will give to you fairy gold instead."

More Light Than 20 Oil Lanterns

AT LAST—the light of lights! A lantern
that lights with common matches just
like the old style oil lantern, but makes
and burns its own gas from common gaso-
line, giving a brilliant, steady, white light
of 300 candle power.

The Name Over the Door Is Just as Important as The Name on the Piano

There are hundreds of different Piano
makes on the market today—many of these
names are unknown to you. Even if you
have seen them advertised you are unable
to verify the statements made about them,
as you have no expert knowledge on the
manufacture of Pianos.

That is why the name over the door of the store
you patronize is just as important as the name on
the Piano. If the name is that of a good reliable
Piano Dealer you can rely upon being shown good
dependable Pianos—you can rely upon his state-
ments and his advice. The result of your call upon
the reliable dealer will be a Piano which will give
you years of satisfaction and a feeling that you re-
ceived full value for the money paid.

We invite you to call at any of our stores—or write us
asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Planolas and
Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

Portable heat—
convenient - economical

At the light of a match—in-
stant heat. No smoke, no odor.
Comfort without dust or dirt.
Oil consumed only as needed.

Pearl Oil is refined and re-
refined; pure and clean burn-
ing. Sold in bulk and in five-
gallon cans. Order by name—
Pearl Oil.

We recommend Perfection Oil
Heaters.

STANDARD OIL COMPANY
CALIFORNIA

She planted the rod in the earth, and it at once became green. From it grew beautiful leaves, and many stems, and over all the fairy scattered millions of tiny stars of fairy gold till the top of the plant looked like sunshine. "Hereafter you shall be called 'Goldenrod,'" said the fairy, "and everyone shall love you."

What the fairy has said has come to pass. The lovely goldenrod has been showing her yellow stars in our meadows ever since that day.—Sophia Brown, in Christian Intelligencer.

CANNED TOMATOES.

Tomatoes can probably be prepared in a greater number of ways than any other common vegetable. They form the basis of many soups and are used in sauces for fish or oysters. As a vegetable, they may be used in many ways. Tomatoes are one of the stand-bys in salad-making and the combinations made with onions, pepper and spices are almost endless. Canned, they do not spoil easily when reasonable care is exercised in the work.

One of the best methods of canning tomatoes is: Select only sound and ripe tomatoes. Dip them in boiling water for about 1½ minutes, or until the skins loosen. Remove skins and, with a slender-pointed knife, cut out the core without cutting into the seed cells. Have in readiness jars which have been boiled 15 minutes. Pack the whole tomatoes into the jars as rapidly as they are peeled. Add one level teaspoon of sugar and one-half teaspoon of salt to each quart. Put on the cleansed rubber, which has been dipped in hot soda water and top which has been boiled 15 minutes. Half tighten the top. If hot-water bath canner, either commercial or home-made, is used, place jar on false bottom with sufficient water to process the jars. Boil 30 minutes after the water starts boiling vigorously. Remove jars, tighten tops, invert to test for leaks and store in a cool, dark, dry place.

Another procedure which is more economical of space is to fill quart jars with peeled whole tomatoes and then pour in a thick tomato sauce. Each jar will have whole tomatoes

for salads or baking and a tomato puree for soups or sauces. This sauce is made by cooking the small or broken tomatoes until tender. The seeds are then removed and the pulp concentrated by boiling to about the consistency of catsup. Process quart jars for 30 minutes.

FLY MIXTURE.

Practically all fly poisons contain arsenical poisons that would be fatal to children, and every year lives are lost by their careless use. For that reason, it is best to specify that formalin should be used in weak dilutions (1 to 1½ per cent) at which strength it would not be easy to drink a fatal quantity.

A formula furnished by the University of California is as follows: one part each of formalin, sour milk, sugar, or syrup to twenty-four parts of water. For household use, the measurements may be by tablespoonful or where large quantities are required, by pints. The poison is used as follows: place a thin slice of bread, or scraps of bread, in a saucer and pour over this enough of the above mixture to saturate the bread and leave some of the liquid free. Then place the receptacle where flies are abundant. Since the formalin evaporates within a few hours, a fresh mixture should be added two or three times daily. Flies drinking this mixture die within a few minutes, usually falling within four or five feet of the dishes.

USE OF OILED PAPER.

There are many uses of oiled paper besides that of wrapping sandwiches. Rice, macaroni, cold cereal may be covered by pressing the paper tight to its surface and no hard crust is formed. Keeping out the air keeps the surface soft and fresh. If spread over the cut end of a melon, it excludes the air and prevents a tough dry layer. Left over piecrust, if tightly wrapped in it will not develop that heavy crust so trying and wasteful Jelly that is to be used shortly may be sealed with oiled paper instead of paraffine.

If desired, all of the tomatoes may be cooked to a pulp and a more economical utilization of space within the jar will be obtained.

THE PREMIER BURNER

Makes Gas from Kerosene (common coal-oil)

The Original Cost is Small, and this is the only expense you'll ever have—for if the Burner becomes defective we replace it free of cost, and there is no time limit to this.

Just to show the durability and dependability of the Premier, we call your attention again to the burner installed in the Mile Rock Light-house, that has been burning continuously since seven thousand hours.

Complete Outfit, \$12.50—for No. 6 Stoves.

Complete Outfit, \$20.00—for No. 7 to No. 9 Stoves.

A Mileage Harvest

JUDGE tires by results. On the strictest basis of mileage measurement, the Ajax Road King tops the field.

Chief among reasons for the greater mileage yield of the Ajax Road King is that special feature—Ajax Shoulders of Strength. Shoulders of Strength are burly buttresses of rubber that brace and reinforce the tread. Their function is to add mileage—and they do, for they distribute wear evenly over the road. They put more rubber where it should be—more tread on the road.

The harvest tells. Try Ajax Road King tires. They are typical of the better inbuilt value that makes Ajax mileage yield so great.

Black for seed	Nominal
Recleaned Red or Black for seed	Nominal

CORN.

While the price of corn is being well maintained the market is practically dead. There is little prospect for an increase in the local demand.

California	\$3.80 @ 3.90
Egyptian, choice	Nominal
Milo	Nominal

HAY.

Receipts of hay for the past week were 2809 tons compared with 3459 the previous week. Holidays interfered with the market and this in conjunction with the shortage of cars which is becoming more stringent daily, had the effect of cutting receipts. Most of the receipts came in from the bay and river districts and have been mostly tame oat hay and alfalfa. During the week the Government received bids for about four thousand tons of hay for shipment to Manila and Honolulu. This hay has to be double compressed, and it is probable the award will be made to some San Francisco bidders.

No. 1 Wheat, or Wheat & Oat	\$15.00 @ 18.00

BEANS.

There were no developments in the bean market during the present week. With the exception of pink beans prices were nominally unchanged. The latter were priced down from 15 to 25 cents in an effort to effect sales. With the very few sales reported, it is evident that the stocks are pretty strongly held and prices are not expected to show any radical falling off.

Bayos, per cbl	\$6.25 @ 6.50
Blackeyes	.55 @ 50 @ 5.75
Cranberry beans	\$6.20 @ 6.50
Limas (South, recleaned)	\$12.00

Tagary Beans	\$2.00 @ 2.25
Garbanzos	\$10.00 @ 10.50
Large whites	\$4.50 @ 4.90
Small whites	\$7.50 @ 7.75

POULTRY.

The poultry market is waiting on the results of the strike of pickers which developed on Monday of this week. The pickers last week made a demand of an increase of pay from 4 cents to 5 cents per fowl. This was granted temporarily as an experiment, but the advance was withdrawn the latter part of the week on the ground that the dealers could not pay it. As a consequence the men went out on Monday, and live poultry is beginning

BUTTER.

Trading has been active at advancing prices throughout the week. Firsts have been pretty well cleaned up and no quotations were made on them on either Monday or Wednesday of this week. The butter market looks very firm under the decreasing receipts and as a result of increased outside demand. During the past week the receipts of butter here were 257,189 pounds compared with 416,939 pounds the previous week and 445,009 a year ago.

Underized	.35	.33 1/2	.34	.35		.35 1/2

CHEESE.

The cheese market was somewhat quiet, notwithstanding the radical change in price for California Y. A. Fancy. This drop was due to a readjustment of price caused by the steady decline in Oregon Y. A. until the differential became so great that the California product would not move.

California Flats, fancy	.31c
do, Firsts	Nominal
Y. A. Fancy	.31 1/2c
Oregon Triple	.29 1/2c

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., Sept. 9, 1919.

Weather conditions being somewhat more favorable during the past week in the far Eastern markets, resulted in the stock moving more freely and with an upward tendency on practically all varieties. This was particularly noticeable on Tokays and Bartlett Pears, the pinnacle of the season being reached on Bartletts, with a top price of \$5.85.

The market on freestone peaches is somewhat easier, owing to heavy supplies from the Northwest and Colorado. There appears, however, to be a very firm, though not heavy demand for clings.

Plum shipments have practically discontinued with the exception of a few scattered lots from the mountain districts and as there is a light supply en route, the offerings were hardly in keeping with the demand, though prices showed very little advance, if any, over the week previous.

Malagas seem to be holding their own, with the situation steady. Tokays have the preference, good stock, well sugared and colored, bringing very fancy prices.

On account of a refrigerator car

shortage which developed in California about a week ago, the movement of fruit from now on will be very light and probably at no time will the shipments exceed 35 per cent of what could be moved if there was adequate equipment to handle the crop.

The light rain a few days ago did little or no damage, and growers, fearing early heavy rains, are making every effort to harvest their crops but, unfortunately, are seriously hampered by the shortage of cars.

NEW YORK: Bartlett Pears, \$3.75; B. Clairgeau, \$3.31; Malaga Grapes, \$1.76; Tokays, \$3.05; Rose Peru, \$1.61; Muscats, \$1.45; Zinfandels, \$1.70; Alicante Bouchet, \$2.05; Thompson Seedless, \$2.18.

BOSTON: Bartlett Pears, \$1.73; B. Hardy, \$3.00; B. Clairgeau, \$4.00; Malaga Grapes, \$1.73; Black Prince, \$1.77; Malvoise, \$1.70; Tokays, \$2.70; Zinfandel, \$1.65; Muscats, \$1.55; Alicante Bouchet, \$1.95; Rose Peru, \$1.75.

CHICAGO: Bartlett Pears, \$3.80; Philip Clings, \$1.30; Elbertas, \$1.25; Susquehanna, \$1.27; Lovells, \$5; Salways, \$1.16; Malaga Grapes, \$1.93; Zinfandel, \$1.91; Tokays, \$2.97.

BANNER YEAR FOR CALIFORNIA'S CITRUS INDUSTRY.

For the year ending August 31, 1919, shipments of California citrus fruits totaled 45,692 carloads and returned \$75,600,000 to California during the year, according to the annual report of G. Harold Powell, General Manager of the California Fruit Growers' Exchange, just issued. The State produced 35,778 carloads of oranges and grapefruit and 9,914 carloads of lemons and the crops of lemons and Valencia oranges were each the largest ever shipped from the State. The Exchange handled 33,082 carloads, or 72.2 per cent of the crop.

An annual yield of California lemons that will exceed the present combined domestic and foreign supply by at least 50 per cent within the next decade, and the rapid growth of the Valencia orange crop due to recent plantings are predicted in the report.

This year the big growers' organization marketed 14,816,737 boxes of oranges, lemons and grapefruit at a cost of 5.2 cents a box, or 1.04 per cent of the delivered value. There was also spent for advertising 2 1/2 cents a box for oranges and 4 cents for lemons, making the combined advertising and selling cost 1.62 per cent of the fruit delivered value. The operations are conducted at cost and everything above actual expenses is returned to the grower.

"Although somewhat reduced by the cold weather in January this year's lemon crop was 70.2 per cent larger than that of last year and 22.3 per cent larger than the biggest year on record," according to the report. "This year's shipments of lemons were 17.6 per cent more than the total supply of both foreign and California lemons in 1917-18, and only 3.0 per cent less than the average supply of foreign and domestic lemons during the last five years."

Mr. Powell says further: "The advance in prices on all citrus fruits since the beginning of the war has not kept pace with the rise of commodities in general, particularly those purchased by the producer."

"The value of citrus property in California may be said to depend very largely upon the success with which each crop is marketed. The distribution of the California citrus fruit crop, through the California Fruit Growers' Exchange, represents the most highly developed system of organized marketing, to be found in American agriculture. After an evolution of 25 years the Exchange growers, through economic necessity, have developed their own distributing and marketing service which they operate with profit, as a true industrial democracy. In the last seven years the Exchange membership has increased from approximately 6,000 to more than 10,000 growers, while the combined number of shippers, associations and District Exchanges in the organization has increased from 133 to 216."

The Exchange shippers operate two subsidiary companies for the manufacture of orange and lemon by-products.

COTTON CROP BOUGHT UP.

Purchase of the cotton crop of 6000 acres at Oxalis and Don Palos, Kern Co., has been announced by the California Products company of Fresno. The buyer is Ed M. Fowler company of Los Angeles. The company will put a loading station at Oxalis to unload the seed cotton from the wagons and load it on freight cars for Fresno ginning. The baled cotton will be handled in Fresno and the seeds crushed there in a mill belonging to the company. The crop was handled through San Francisco last year; this year it will go into Los Angeles.

Strout's Fall Farm Catalog!

You will never have seen the best until you read the 100 pages of our big illustrated Catalog, just out, of unequalled money-making farm bargains in the most prosperous States from Maine to Florida and west to Nebraska. For example, on page 74: 80-acre Middle West producer, near RR town, good buildings, 2 horses, cows, hogs, machinery crops all for \$4000 half cash. Page 12: details 170 acres, horses, 8 head registered stock, tools, crops, good buildings, silo, etc., for \$3500. See picture page 10: attractive home on 60 acres, horses, cows, hogs, implements, furniture, \$2000, easy terms. Full details page 33 of 345 acres, 75-cow dairy farm, milk checks running \$500 per month, fine 10-room house, big basement barns, 4 horses, 33 head stock, machinery, crops, all for \$7,000, part cash. Write today for your free copy showing you the farm you want, where you want it at the price you want to pay. STROUT FARM AGENCY, 831AF, New York Life Bldg., Kansas City.

ATTRACTIVE DAIRY RANCH

80 acres highly improved and equipped, located at station on main line railroad within 90 miles of Oakland; 150-ton barn, 60 stanchion milk barn, large tank house, 5-room house, family orchard, silo, cooling and separator machinery with boiler and engine, milking machine, 4 horses and all farming implements; about 70 acres in fine alfalfa, 8 acres corn; all deep, rich, sandy loam soil; checked, leveled and boxed; irrigated direct from district ditch; facing two county roads. About 60 head of very fine dairy cattle may be purchased with the place. This herd holds record for Stanislaus county on alfalfa feed alone, one producing an average of 2.83 pounds butter fat per day for 28 days. This place will pay \$1,000 per month to a good live dairyman. Write or call for further particulars and arrange to let us show you this place.

F. D. BURR CO
350 Russ Bldg., 235 Montgomery St.
San Francisco, Cal.

DAIRY AND ORCHARD RANCH for sale by owners, about 120 acres. Good location, new buildings. Will be sold on easy terms and reasonable price. \$10,000 will be accepted as first payment. Alex T. Gibson, P. O. Box 561, Chico, Cal. Residence, 216 East 1st Ave., Chico, Cal.

WANTED—By young married farmer, to rent a ranch for cash or crop share, suitable for raising hogs, cattle or sheep. One fully stocked preferred. Address E. F. Ladouceur, Concord, Cal.

FOR SALE—Alfalfa ranch of 23 1/3 acres, stanchions for 20 cows, house, separator stanchions for 20 cows, house, separator house, garage, chicken houses and other out-buildings. If interested address Box 58, Esparto, Calif.

CAUTION

Do Not Be Deceived

There is only one GENUINE O. M. Franklin Blackleg Aggressin (commonly called Vaccine).

Beware of imitations. You can not afford to have anyone experiment on your animals.

Accurate use of the Genuine O. M. FRANKLIN Blackleg Vaccine positively protects against Blackleg.

Be absolutely safe by using the ORIGINAL and GENUINE manufactured by THE KANSAS BLACKLEG SERUM CO., under the direct supervision of Dr. O. M. Franklin, the ORIGINATOR.

LOS ANGELES

Standardizing the Humboldt Apple Crop

Written for Pacific Rural Press by J. A. Robson, Eureka.

THE ORCHARDISTS OF HUMBOLDT COUNTY, Northern California, are looking forward to an especially prosperous year through the benefits to be derived from the organization of two co-operative organizations—the Humboldt County Apple Growers' Association and the Northern California Apple Show Association. While Humboldt county is generally regarded as a lumbering and dairying district, it nevertheless has many sections adapted to the production of a fine quality of apples. Apple-raising has been engaged in for many years in the southern part of the county especially, but, owing to the small acreages, diversity of fruit and the difficulties of marketing, the business has been retarded. It was not until an apple show, held last

Losses from Improperly Packed and Ungraded Apples.

This was one of the important things to be brought to the attention of the Humboldt growers. Another was the depreciation in the market price of improperly packed and ungraded apples. The displays at the apple show not only showed an excellent quality of fruit, but it was of a standard grade and properly packed. The boxes sold at an average of \$2.50 per 48-pound box, while the same fruit, ungraded and improperly packed, sold in the local markets for less than half this price. A professional grader and packer also gave demonstrations for the benefit of the apple-growers, both in the exhibit rooms and in the close-by orchard, which thoroughly convinced the orchardists of the desirability of establishing a standard pack

The above picture shows a group of enthusiastic workers taking lessons in grading and packing apples in a Humboldt county apple orchard.

October in Eureka under the supervision of the Board of Supervisors of Humboldt county, brought home the full possibilities of the apple-growing industry to residents of widely separated districts that an effort was made to pool the interests of these northern orchardists for the mutual benefit.

The Get-Together Movement.

As results have already shown, the apple show was something more than an exhibit of a heterogeneous assortment of fruit; it was a clearing house of apple problems. For the first time the apple growers from all sections of the county met together and were able to discuss the difficulties which each encountered in his own particular district. It was found that all were sufferers from a few common obstacles, which annually robbed them of the profits that should have been theirs. First, there was the apple output itself. While nearly every district was represented by a handsome display of fruit, not only were there many different varieties for each section, but nearly every exhibitor showed several kinds of excellent apples. The inference was plain. In place of having fruit of a single variety that could be offered in wholesale lots to buyers in any given district, the orchards were annually producing many excellent kinds of apples, but in such small lots that they were difficult to market at any price. This was the result of the individualistic tendencies of the average orchard-farmer, each man planting the kind of fruit he happened to favor with small regard to what his neighbors were doing. The consequence was what is popularly termed the "family" orchard—small orchards that supplied more than the family needed, leaving a surplus to seek a market—in contradistinction to the large commercial tracts. The diversity of variety in most cases prevented the orchardists combining their surplus and remoteness of location or difficulties of transportation made it impossible for each to seek his own market.

under a standard label if the Humboldt fruit were to find its proper place in the market. Among other benefits of which the growers felt themselves in need was instruction in proper pruning and spraying.

The Humboldt Apple Growers' Association, which was subsequently formed, is designed to care for all these difficulties. Working under the general supervision of the Horticultural Commissioner, a definite plan of planting and culture for each section will be worked out with the best possible market as the ultimate object. Many new acreages are being planted this season, and these will be of a few standard varieties of fruit that will permit selling the output of each district in carload lots. Power sprays are being purchased on the co-operative plan. The Humboldt apple output will be put on the market this year under a standard label and pack. Each member will derive the advantages of a profitable market which he, alone, could not secure for himself.

The Northern California Apple Show Association, also organized as a direct result of the apple show, has for its aim the furtherance of the interest in apple growing by holding an annual apple show, to which exhibitors from other sections of the State will be invited to send exhibits. It is arranged to hold the first show under his organization next December, when exhibits in carload lots will be sent from all sections of the county.

Naturally Adapted to Fine Apple Production.

Humboldt county is a natural apple country, having the broken topography that provides an excellent air as well as soil drainage essential to the production of fine-flavored as well as good-keeping apples. It is to the air currents from Mount Hood that the apples of Rogue River Valley, Oregon, owe much of their flavor and quality. The mountain pockets of Humboldt and the areas along the river bottoms have the same climatic conditions and the soil is wonderfully suited to this sort of fruit-raising.

EDITORIAL.

THE COMING OF A GOOD YEAR.

THE time has arrived for our annual set-to with the weather prophets. It requires some courage to strike out in this line, it is true, for there is always some highly esteemed old friend and subscriber whose feelings are hurt by our inadvertence toward these self-anointed seers, and there is a commercial prophecy-joint in the Middle West, drawing its income from popular credulity, which holds us up to public scorn. They say we are not on the Lord's side because we refuse to go beyond the attainments of science—claiming that science is of the devil and that the Lord loves unscience, while the fact really is that the Lord made all the science in the world and could not make anything else, except as he gave man free-will to dig it up if he wished to. It is fortunate, of course, that many times men who go out in their perversity to dig up unscience turn up the real article—just as going out to dig fish-worms a man may find nuggets on the grass-roots—and may continue to proclaim the discovery unscience when it is really about all the true science we have on the subject. Such is the case with S. V. Rehart, the Oregon weather prophet, who glories in unscience, and has just made his prophecy for the coming year as follows:

"Owing to the early spring months being cool, we may not expect much rainfall during the early months of autumn.

"Basing my predictions concerning the amount of probable precipitation upon the duration and intensity of the heat period during the summer months, I calculate that the unusually hot weather that prevailed throughout the Pacific coast from the latter part of May until September indicates two things, viz.:

- "1. Unusual heavy storms, and
- "2. Considerably more than normal precipitation for the Pacific coast during the ensuing season, with plenty of snow on the plateau and mountain regions."

Good for Rehart: as a weather prophet he takes the right stride!

THE PHILOSOPHY AND THE FACT OF IT.

Of course, we are not approving Mr. Rehart's philosophy, which is that because it was hot in the summer it will be cold in the winter. He works upon the doctrine of the opposites as he conceives it, and it is old as the Chaldeans. This doctrine teaches that if a man has a stomach-ache one day he will have a backache the next day—that is, if he is thick enough to tell them apart—whereas the fact of common experience is that if he has one today he is more likely to have the recurrence of the same tomorrow than of the opposite. We have, therefore, to discard Mr. Rehart's philosophy, but still retain the likelihood that his prophecy is true. And why is it probably true? Because that is the way it usually or normally is. The summer is usually hot and the winter is usually cold, not because one influences the other, but because both are caused by the relation of the sun to our earth-surface—not by a spot on the sun, but by the whole red-hot cheese thereof—and by the air-movements

which are connected therewith, though not wholly caused thereby. There is no evidence that a summer meteorological performance influences a following winter performance, nor that it is even followed thereby, either by the opposite, as Mr. Rehart believes, or by recurrence of the same—with one reservation, viz.: that there is always a tendency toward whatever is normal in the particular region under consideration. And that is the reason why we accept Mr. Rehart's prophecy as more likely to be true than any other. It is usual or normal for us to have a good rainfall in most parts of California. It is only about once in two decades that we have a very bad one. It is usual or normal for us to have very light early rains. It is rational for us "not to expect much rain during the early months of autumn." It is rational for us to expect a good rainfall afterwards. And so with the wild geese flying southward overhead and the ground-hog burrowing high underneath, and with Mr. Rehart coming through the middle, we are in for a good year!

THE DANGER OF FALL RAINS.

A little September rain hurts nothing and helps many things. A heavy September rain and a succession of dark, damp days hurt everything and help nothing except a little late gardensass perhaps. Never since rainfall records began with American occupation, seventy years ago, has there been a September rain in our coast valleys like that of last year, and, applying to the situation Rehart's prophecy and our reasoning, last year's experience is not likely to be repeated. Last year's loss of about half the prune crop in some regions scared the growers into more respect for drying houses, which they would not have acknowledged before the rains came. Adding to this desire for safety from too early rains comes the interest in drying grapes in places where the autumn is not trustworthy for late ripening kinds. The result is that more attention is being paid to house and machine drying than for nearly forty years past, and a general question is, do we need discount the estimate of the desirability of sunshine drying, which we have lived and built upon ever since we turned our backs upon evaporators for cut-fruits, when the virtues of sulphuring were demonstrated in the early '80s, and gave Oregon and Washington the sole rights to stack and tunnel driers for prunes about the same years. We are reciting in our columns from week to week many facts about the current passion for providing artificial driers, because we desire readers to give the matter full consideration, and, if their judgment favors it, to provide themselves with safety devices against waste and loss as becomes efficient producers of cured fruits. Many individuals are designing and constructing driers, and the University Experiment Station is conducting important experiments to demonstrate the advantage of making such devices available. Two things occur to us as very promising in the design, construction and operation of artificial evaporators or dehydrators, as they are now being presented to the public. First, they have capacity beyond all the arrangements proposed forty years ago, and they are therefore much more in harmony with California conditions and requirements. Second, there has become available since the abandonment of artificial driers forty years ago the whole recourse to oil-fuel and devices to get and distribute heat from it. These two new things may be almost said to have put a new face upon machine evaporating in California and constituted it more reasonable and practicable, and encourage the Rural Press to give more attention to it than we have for more than half a lifetime. And yet, while we are doing this, we would caution readers against getting wild over artificial drying of fruits or losing sight of the natural advantages which he have in sun-curing as one of our most distinctive resources in fruit production. There was much money lost in building driers forty years ago, because after buying or building they went unused. A few acres of trays and open ground to spread them on; a few sacks of sulphur and a sky-full of free sunshine made the grower look upon his machine-drier as a plaything, which he had no time for when he was really busy. And when his product sold as "evaporated," though it had never entered an "evaporator," he really began

the movement which made California cured fruit great. Now we have the same sun overhead, the same earth underneath, the same sulphur in the mountain, and though drying machinery and oil-heat may supplement our product with new forms of much importance, our natural curing advantages must remain our chief agencies in production. It is, of course, true, and very fortunate also, that the driers which we are now contemplating have much higher claims as safety against losses by bad weather, because of their superior capacity, and yet it is only reasonable to calculate rather closely whether there is a chance of losing more in interest and insurance on their cost as a safety recourse alone, than would be lost by the wetting down of a crop or a part of one once in a while—less the labor and fuel cost of saving it. There really is, sometimes, such a thing as saving a product by losing it!

IS BUSINESS WRONG BECAUSE BIG?

When Mr. Heintz, the pickle man, went to heaven a few weeks ago, he left a record of dealing largely in "57 kinds" of foods in all public places. There seems to be no doubt as to his destination, for he not only made good things and dealt in them fairly, but all testimony which we have seen indicates that both by faith and works he departed this life in the right direction. And as we think over what we know about Mr. Heintz, we wonder why it is wrong to deal in any number of kinds of food and other products useful to man. Our wonder arises from the fact that about all we get from the investigation of packers' operations from the government, investigators consists in the extent and variety of their doings. For instance, this comes from Chicago under date of September 13:

Attorney Isidor Kresel, special Federal prosecutor, appointed to handle the investigation of the packers, outlined the main points in his compilation of statistics concerning the "big five" today.

The investigation conducted by Kresel and his associates showed, he stated, that the packers are financially interested in at least 675 lines of food production in the United States, both from the standpoint of manufacture and distribution. The web of subsidiary industries growing out of the stockyards spreads all over the United States, and extends into branches that seem at first remotely connected with the packing industry, but which investigation shows are direct outgrowths of business, the prosecutor said.

"The five Chicago concerns practically control the necessities of life for the people of the United States. They have a complete grip on the price to the producer of the foodstuffs and like products, and they control the price the consumer must pay in the end. Their control of production and market costs makes their hold on the food situation an extremely strong one.

"Economically this creates a situation that is dangerous to the country. This is evidenced by what I learned from the small tanners, who said they lived at the direction of the large concerns. This is no doubt true of other industries besides the tanning industry."

Of this matter of packers' operations we know nothing. We are in the same boat with most other people, we presume, and we are trying to get ashore on some solid ground of conviction as to whether the packers who put up these 675 kinds of food in attractive packages, no doubt, easy to buy and carry home, are doing wrong. The government investigator says they deal largely; that they are in position to control prices; that it may be dangerous to have anybody in such a position; that small tanners have been tanned themselves, and "probably the same is true" of other small handlers of all of these 675 articles of food. The statement of the official prosecutor is probable and his inferences perhaps reasonable, but neither furnish any evidence upon which the packers can be convicted nor upon which one can reach conviction in his own mind as to whether the packers are doing good or ill in the position of control which they seem to have acquired. The press dispatches state that the investigators have the packers' books. Why is it that we are given only facts about the extent of their operations and tempted to conclude that because they are so large and various they must be wrong? We are also tempted to conclude that because food prices are high the packers make them so, but on that line any one who knows anything about the cost of production of foods also knows that the prices the food producers get are not high enough to cover

their extra costs of producing what they have to sell. If the packers are really getting more than their share in the business of feeding the people why are we not told that, and not filled up with mere suspicions that they may be 675 kinds of scalawags?

HUMBOLDT ADVANCING.

It is gratifying to note that Humboldt county is advancing to a much more prominent position in the public eye. Humboldt has always played an important part in California development, but it has not been spectacular and has been taken rather as a matter of course than otherwise. It seemed natural enough that half a century ago San Francisco should have largely depended upon the moist lands around Humboldt Bay for her potato supply and that "Humboldt reds" were the spuds which caused travelers to wonder—for who ever saw so red a jacket buttoned so tightly over so white a breast! And then it also seemed perfectly natural that the cool, moist summer air of the lower Eel River Valley should give us nearly all the peas and oats which were grown forty years ago, and that the same conditions par excellence for forage should have led to dairy development which made Humboldt our leading dairy county twenty years ago, first county to build large creameries, first county to make export butter and to get the valuable by-products out of skim-milk, and first to organize dairy producers in an effective, co-operative way. All these things were easy for Humboldt because her natural conditions were so favorable—in a way as easy as it was for her to lead in lumbering, using the trees which had been growing for centuries toward that achievement.

And now upon so solid a foundation of historical achievement Humboldt county is building a super-structure of current development, which cannot be taken for granted and overlooked. We are using this issue to prominently announce that Humboldt county will hold a great apple show at Eureka. Sebastopol is getting rather lazily contented with the shows she has made of her Gravensteins and Watsonville with her Bellflowers and Yellow Newtowns. Eureka sings to them: "Take a rest, old girls. I will undo a few smiles and tresses, just to show that you are not the only ones who can win the trophies of Helen and Aphrodite." And so apple lovers will be going to Eureka by motor and trainload to see the show and to lead the bashful beauty of the northern coast into the fuller light of California advancement.

A FOREST-FRINGED HIGHWAY.

But while Humboldt is doing such things largely to make her own glories known, she also has an enterprise in hand which will make for the glory of the whole State. The new State Highway northward to Humboldt Bay runs through something like forty miles of primeval forest on its course. Local citizens under the leadership of Mr. Robson, who strikes us as a whole cable of live wires, are determined to preserve for all time a beautiful forest fringe to this highway, and not allow it to run for decades through a waste of stumpage which would accompany the gradual commercial destruction of these grand old trees. And so the proposition is to purchase and dedicate to public use forever, a sufficient strip of land on both sides of the State Highway, not only to preserve great trees, but to impart the impression of traversing a continuous forest in its natural condition. Such an exhibit of natural beauty will draw visitors from all parts of the world and will constitute one of the most unique attractions of California. And what it will do for the world it will achieve, first for the joy and elevation of our own people. One of the best things about this proposition, which is really only a few weeks old, is that the realization of it is already practically assured. A sum of \$60,000 was required to stop the cutting of the red-woods on such a strip of land. Former Congressman William Kent, who gave the beautiful Muir woods on Mt. Tamalpais for a public park, hearing of the need of immediate action to save the trees, made a contribution of \$15,000, which was duplicated by Stephen T. Mather, director of the National Park Service, who telegraphed his pledge

from New York on September 9th, and on the next day the Humboldt County Board of Supervisors appropriated the \$30,000 necessary to insure the safety of the trees until the enterprise can be fully financed! That is the way we do things in California—even if we do have to call upon New York to help! It is going to be a good year—for Humboldt county at least, and perhaps the rest of us can catch on!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Dwarf Fruit Trees.

To the Editor: Will the dwarf fruit tree raised in the eastern nurseries do well fairly, or otherwise replanted in California? Can such trees be obtained in California nurseries?—A. D., San Gabriel.

Probably as a rule they will do better than they do at the East, but when you get that you have not gained much. The most satisfactory dwarf tree is pear on a quince root, and that you can get at California nurseries. Other dwarf trees are interesting playthings for an amateur who will take pains to learn how to grow them, or is rich enough to hire a gardener who knows how. They will cost much more to get and to care for than standard trees and will yield, inversely, as much less.

Why Is Formosa Shy?

To the Editor: Why does not the Formosa plum bear well on most trees? I have 1,000 large apricot trees grafted to Formosa, and I get about 350 to 400 crates, when I should get at least 3,000. The grafts are over 7 years old, and the trees are fine to look at, but they will not bear. The plum was advertised at first as a fine bearer.—H. B. N., Vacaville.

Just why some varieties bear well at first and not afterwards has never been explained so far as we know. Very many apricot seedlings, which secured some distribution, have had to be abandoned for that reason, and some almonds have gone the same way. The Formosa is a bad offender and is being dropped by propagators for that reason. They are working on plum bearing at the University Farm and Formosa surely needs help.

Selling Fruit to Cannerys.

To the Editor: I sold one ton of peaches to a cannery through a fruit buyer on a certain contract. I sent first-class peaches. After 10 days they sent me a check for half the price and said the peaches were not fit to can. Shouldn't they have notified me at the time of receiving them of the condition of the fruit, before they canned them. I think it is just a skin game. Two other ranchers sent some and got the same letter. We sent a carload in all. Cannot the cannery be made to pay for the full amount the contract calls for?—Grower, Antioch.

Only a smart lawyer could do it and the operation would cost you more than the peaches were worth before the cannery stopped fighting. Besides, the smartest lawyer could not do much without unimpeachable evidence that the peaches arrived in good condition, and we presume it is not possible to get such evidence now. Whenever a shipment is made to a cannery which you are not sure is handling fruit on the square, you ought to send a bright man or woman along to see in exactly what condition it arrives and how it grades with the conditions of the contract and secure a fair acceptance.

Off With Their Heads!

To the Editor: Some weeks ago you advised an Oregon enquirer to graft over a few apple trees, which were not bearing as others planted at the same time were bearing. It occurs to me that the trees might not be seedlings as you suggested, but were Northern Spies, as this apple is 16 or 17 years in coming into bearing in the North Pacific country. In this country the Spy does not bear until 12 or 13 years old. Ours had 2 apples on last year, but this year (13th) has a fair crop. It did not bloom till last year, and then only about a dozen showed up. The woolly aphid does not attack the Spy.—Samuel Haigh, San Jose.

You are quite right; they are possibly Spies, but we should graft them over just the same, for the Spy is not only too slow at beginning, but it is too shy in sticking to it. It is a good idea to keep a Spy tree to get cuttings for starting other apples

with roots, which the woolly aphid will not injure, but on the whole it is perhaps better for the grower to take a hint from the aphid and let the tree alone. We partly grew up beside a row of Northern Spies in western New York, and the way we talked to those trees three score years ago was unfit to print. It is quite possible they deserve it still.

Fruits for Alkali.

To the Editor: I have about five acres of land that is strong with black alkali. I am putting the balance of my farm to trees and would like to know what kind of fruit you would suggest to plant on it. I have been told that figs or pomegranates will grow on strong alkali. If you know of any kind of fruit that will grow an alkali, I wish you would let me know what to plant. The piece of ground is not low or swampy; it is high and dry, and there is good land all around it. I have raised good crops of grain on this land, but only on certain years.—Planter, Porterville.

The fruits which have best reputation for enduring alkali are dates, pomegranates and pears. Figs do not like it much better than other fruits. There is little doubt that date palms have a great future in your valley, but many things in profitability have still to be determined and the conclusion is remote. Pomegranates endure considerable alkali, but the markets have never indicated that they would take many pomegranates, although they do pay well for a few. Pears tolerate more alkali than other orchard fruits, though they are considerably depressed while doing it. It is very doubtful whether the investment which a pear orchard requires should be made on such a doubtful foundation. It is in fact very doubtful whether land "strong in black alkali" should be considered for fruit at all. If you can get good grain crops on the land when there is rain enough to keep the alkali down, it is probable that you cannot do any better with it until you undertake the considerable expenditure which is required to under-drain and wash the alkali out of it.

Basins or Sprinklers?

To the Editor: My land is rolling and will hardly permit the furrow system of irrigation. I therefore basin them, let the water soak in till I can ram a hoe handle down to the blade. This makes lots of work as I get in and cultivate the basins with a tined hoe after it is dry enough to be in shape. My neighbor is trying to avoid all this work by using lawn sprinklers to water his trees. He lets water run on them an hour through a 3/4-inch pipe, about 200 gallons to a tree. They are about 5 feet high and the same distance through. In this way he waters a space about 10 feet in diameter. I asked him how deep the water went, and he said about two feet. Now I think this system would encourage the roots to come to the top of the ground. When the ground is plowed I think it would cut lots of roots. Moisture here from underground water comes up to within 15 or 20 feet of the surface. Would not my plan of coaxing the roots down to this moisture be the better one? As President Wilson says: "May I" see an early answer in your valuable paper?—R. G. M., Sherman.

Your way is more rational and your trees will be large and productive while his are petering out. Without considering the loss of the roots by cultivation, it is a fact that, losing the upper six inches by cultivation, he will be trying to grow a crop of fruit on a foot and a half of soil—which will require a power of sprinkling and of fertilizers also, and we doubt if the trees will stand for it for long. On the other hand you will be disappointed if you expect to get many roots down to the bottom water, or to get much moisture from that source for your trees. Your crop will come from the length of your hoe-handle and the water and plant food you make available to about that depth probably—and that will give your trees two or three times the resources your neighbors will have.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending September 16, 1919.

Stations—	Rainfall			Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest	Lowest
Eureka36	.81	.64	66	50
Red Bluff00	.48	.18	94	56
Sacramento00	.40	.13	90	54
San Francisco00	.12	.01	76	54

For Profit's Sake Wipe Out Tuberculosis

Written for Pacific Rural Press by George T. Swaim, Davis.

Infection.

An animal is infected by acquiring the bacillus tuberculosis which causes the formation of the characteristic tubercles of the disease. The bacillus may be acquired by inhaling live organisms into the lungs, by eating or drinking materials containing the bacteria, by coition through infected sexual organs, or (rarely) by direct transmission of the disease from the mother to her foetus. An infected animal may become a menace to the rest of the herd and is quite certain to do so sooner or later, for if an animal develops an open case the disease is very certain to spread through the herd. A herd may thus become infected through the introduction of an animal carrying the disease.

Calves may be fed tuberculous milk from infected cows. Cattle shown at fairs and the like may contract the disease from other while being shown.

Because of the many ways in which tuberculosis is spread, the owner can never be too particular in watching out for and combating the infection of his herd. Some animals take the disease easier than others, just as some persons seem to be ill with all the diseases that go the rounds. This special susceptibility is due in large amount to the inability of that particular animal's tissues to resist the tubercle bacillus. Any of the following causes, however, may reduce the vitality of an animal to the extent that it falls a ready victim whenever the chance arises: insufficient feed, exposure to extremes of temperature, unsanitary surroundings, piles of manure, drain of extremely heavy milk production. Thus it behooves the livestock owner to furnish clean, healthful surroundings for his herd and to see that they are not placed in such a position that they can not resist infection.

Symptoms.

Physical examination by a qualified veterinarian may, if the diseases is far enough along, make it fairly certain that the trouble is tuberculosis. The symptoms are generally some or all of the following, according to the place of infection and the stage of the disease: unthriftiness, loss of flesh, lowering of milk yield, a cough, nasal discharge, diarrhoea, enlargement of the glands, hard lumps in the udder, chronic bloating, or shortwindedness. A postmortem examination of the carcass will, except in the case of very slight infections, reveal the exact nature of the disease and the location of the tubercles. But a physical examination will not determine the presence of a diseased condition until that condition has progressed so far that it may have in the meantime become dangerous to the rest of the herd and to the consumers of the milk produced. Tuberculin test, however, discovers nearly all cases, and at any stage of development. Hence it is the one reliable method of determination.

The Tuberculin Test.

Tuberculin is a drug prepared by sterilizing, filtering and concentrating the liquids in which the tubercle bacillus has been allowed to vegetate, but because of its sterilization it is not capable of transmitting tuberculosis or causing any disease of that sort. It was discovered by the scientist Koch, who made it in an attempt to find a cure for the disease. His trials with it soon proved that it would not cure, but that when injected into animals that were suffering with tuberculosis a reaction would occur and the animal's temperature would rise. This has proved to be a wonderfully certain means of detecting the presence of tuberculosis.

The first method to be used was that of injecting a small quantity under the skin and taking the temperature to determine the reaction. This method is the subcutaneous, and is very reliable, but an animal reacting to this test will not react to the same test until the effect of the first one has been lost, and "plugging" has sometimes been done by dishonest

Tuberculosis annually causes losses estimated at upwards of \$25,000,000, and this amount is gradually on the increase. The disease is readily transmissible among animals, and even human beings may become infected from cattle. This is especially true in the case of babies, whose only means of sustenance often is cow's milk, and they are exposed to the action of the bacteria at the most easily infected period of their lives. For this reason the presence of tubercle bacteria in milk has aroused the people to the danger of spreading the disease through dairy products, and they are protected in this State by a law which provides for pasteurization of milk or removal of infected cows.

owners so that the animals would not react. The ophthalmic test consists in putting some concentrated tuberculin into the eye at intervals of three to ten days. There is a formation of puss and often watering of the eye in case of a positive reaction. This test can be repeated as often as desired, as it does not render the animal insensitive to another test. The animal must be put in a stable and stanchioned so that it cannot wipe off the exudate before its presence is noticed by the tester. This method is comparatively reliable, but the animal has to be watched more closely than by other methods.

The Intradermal test consists in injecting a small quantity of concentrated tuberculin into the folds of the skin and producing a swelling in case of a positive reaction. The test is very accurate, is easily applied, and its reading is quite positive. The injection is usually at the base of the tail. All three tests may be used together if applied in the proper order: the ophthalmic first; three days later the second dose of the ophthalmic and the injection of the intradermal; then in about six weeks the subcuta-

tions, but it does prove that tuberculosis cannot be cured by a rest and fresh-air method as is often done in humans.

After the introduction of the tuberculin test there were many enthusiasts who came out for the utter destruction of all cattle that reacted to the test. Some laws were passed to bring this about, but with the trial it was found that the method was not economical. It is a great waste of food to bury the carcasses of all reactors without an inspection by a qualified meat inspector, to see that all fit for human consumption is saved and used. This is practicable and safe, as meat from tuberculous cattle is good food except when the disease has reached a generalized condition. A farmer does not want to see his whole herd sent to the slaughter house if the cattle are badly infected. Such a course is too big a loss at one time. The community does not want to see all the cattle put out of the milking business, for it would result in a shortage of milk. The man who has built up a good producing herd does not want to lose the results of his efforts at good breeding,

Every animal in this picture was proved to have tuberculosis. How does the herd compare with yours in appearance as regards health?

neous test, and from the three practically all the tuberculous cattle will react. The main objection to any of the tests is not that it calls well cattle reactors, but that it misses some that are really infected. This is largely overcome by the use of all the tests together, as some animals will only react to one of them, but on slaughter may prove to be tuberculous.

A modification of the subcutaneous test is the so-called sensitizing subcutaneous test and is the application of the regular subcutaneous test followed in three to ten days, or as soon as the reactions for the previous test are over, with another subcutaneous injection three to five times the strength of the first dose. This method will produce a second reaction in those that reacted to the first test and will produce a definite one in some that were in doubt at the first test, while at the same time producing a reaction in some that did not react to the first test at all. This method is claimed to be very accurate and the best so far discovered.

Methods of Control.

Several processes of immunization by the use of the live germ have been tried and while they have been partly successful in calves, the results are of very short duration and the danger of spreading the disease is so great that the California Experiment Station can find no good to be gotten out of it. Some experiment stations tried the use of ideal housing and feeding conditions as a cure for the disease, but the results were negative in all cases. Animals with the disease did not get better, but died as rapidly as those in poorer surroundings. This does not prove that poor conditions are as good for cattle as good condi-

and so taken all together other systems than slaughter are liable to find favor.

One of the first of other systems worked out was that of Bangs of Denmark. It consists chiefly in the strict adherence to the following points: (1) Test every animal with tuberculin. (2) Isolate the reactors entirely. (3) Use a new stable for the healthy animals, or thoroughly clean, disinfect and whitewash the old one. (4) Remove all calves at birth and raise on milk from healthy cows, or on carefully pasteurized milk from their own dams. (5) Test the healthy herd regularly, removing reactors and disinfecting each time. This method will, in the course of a few years, build up a new herd of tuberculosis free animals.

The system of Ostertag has essentially the same principles, but instead of testing the whole herd and isolating the reactors, he isolates the young stock from the whole herd and raises them to milking age as a separate herd and on pasteurized milk. They are tested regularly. Any animals showing signs of tuberculosis is removed at once. This system is not as expensive at the first one, but it is a slower way to get rid of the disease.

Because of the expense and the fact that the thing is new, also that it requires a veterinarian to make the tests, there has been some hesitancy on the part of farmers in undertaking to free their herds from tuberculosis. To help out in this period of hesitancy there has been much educational propaganda carried on by the U. S. Bureau of Animal Industry and by the various experiment stations to show the reason, the value, the methods, and the lasting value of the work. The

Bureau recommends that the loss be stood one-fourth by the Federal government, one-fourth by the State government, one-fourth by the county, and one-fourth by the owner of the animals that react and have to be slaughtered or removed at an actual loss over their real value for producing purposes. This seems fair. The Bureau has taken up the work of testing herds when the service is requested, and then, after cleaning up a herd it issues a certificate of accrediting good for one year. This is a good method if it can be followed throughout the country, and will give a definite basis on which to buy and sell animals for breeding purposes. In some sections the Department has undertaken with the help of all the people to eradicate the disease from a given area, as a county, and has been very successful.

The proposition of herd control should be considered from two angles: the value of the herd, and the amount of infection in the herd. If a herd is made up of valuable purebreds or of high-class grades, it is not likely to be profitable to slaughter all the reactors. The Bangs system, or some modification of it, may be used to the best advantage. Where the herd is a common milking herd and the value of the cows is about as great for beef as for milking, the slaughter method will get the quickest results and is the best to use.

In a herd that is not badly infected, say up to 15 per cent reactors; it is a good practice to sell for slaughter all that react unless they are valuable. Where the herd is infected from 15 to 50 per cent, the Bangs system is probably the best. If the infection is over 50 per cent, the Ostertag system may work best. The result can best be worked out on each farm under the supervision of a good veterinarian, taking the value of the animals, the amount of extra or available equipment, the market, and the capacity of the farmer into account.

Seeding Time for Cover Crops Coming

(Written for Pacific Rural Press by Jno. J. Fox.)

Numbers of orchardists are now asking themselves, "What shall I plant in my orchard or vineyard as a cover crop this year?" "Can I obtain the seed I want; if so, when?" "What shall I have to pay for it?" An innocent-looking bunch of questions, so easily answered by the novice but not so easily disposed of each year by the grower concerned. For it is an ever-recurring problem. We have no voluminous data of specific results to refer to. Moreover, conditions of soil climate and moisture vary in California to such a degree that it will always be impossible to generalize for the State.

In the North, at least, we can definitely conclude that the earlier a cover crop is started the better. This is especially true of legumes, such as clovers and vetches. If these are established with a good strong root system before the cold rains and long nights chill the ground, they may generally be expected to make a steady growth, run away rapidly with the first encouragement of warm weather, and produce a heavy enough crop to turn under early—before the increasing ardor of the sun makes evaporation of moisture greater than we can afford to lose.

What Fertilizing Value Have Weeds?

Every year, without exception, we are asked the question, "Are weeds any good as a cover crop? Burr clover, flarree, miners' lettuce, grain and mullein are coming up thick. Shall I run the cultivator through these weed seedlings and plant vetch?" The answer is, "No." If there is a good stand of weeds they will generally produce a good crop to turn under. If the weeds only produce a dwindling growth under good weather conditions, a legume crop would be just as poor probably and the seed would be wasted to some extent. A crop of barley or rye turned under early will help to correct this lack of condition and put the ground in shape to produce a legume crop the following year with reasonable hopes of success.

Many orchardists who plow late in the spring do so with the double reason of getting the heaviest possible amount of material to turn under and to leave seed in the ground for succeeding cover crops. One sees many instances of good success with this practice where plenty of irrigation water is available and it is scientifically applied. To quote one notable instance of this, the James Mills Orchard Company's lemon orchard west of Maxwell (Colusa county) has been managed in this way for seven years. It still produces a heavy overgrowth without seeding and the trees show no lack of nutrition. The soil is certainly in excellent condition—much better than when the orchard was set out, as one can see from the adjoining unimproved tracts.

We mentioned this spring instances of a narrow strip being left in the center of every alternate tree row for the purpose of furnishing seed for next year. On the hillside it also served to check erosion. The two-foot unplowed strip is not left in the same row two years in succession.

Does "Sweet Corn" (Melilotus) Continue in favor?

More melilotus is being used today as a cover crop than ever before. Where conditions suit, this legume is hard to beat, if it is handled right. We saw some this spring, though, four or five feet tall, headed out and woody stemmed. There may have been birds' nest in it. It was finally cut and carted off onto the headland before plowing could be carried out, proving a useless expenditure of labor, a serious loss in moisture, and an aggravation to the workman who had his ground and headlands messed up. And as adequate return, nobody wants such a wad of stuff as that.

Melilotus does well in the South, especially where citrus men can choose their own time. It does well in those parts of the Santa Clara valley, where irrigation is practised, and, with early rains and a favorable fall even where no irrigation is pos-

sible. It has proven itself in the San Joaquin valley and the Sacramento. Of course, it will grow well enough clear up to the Oregon line and at practically any altitude—give it time. We have seen it four feet high round Klamath Lake. But in the northern coast counties it is no use. It germinates all right and makes a little start, but does not begin growing in good earnest till plow time.

How to Plant Melilotus.

In sections where water is available it pays to give the orchard an irrigation as soon as the crop is off in the fall. Run over it with the spring tooth or double disk with light harrow attached, then sow right on top of the ground. Brush it over with a very light harrow or some tree branches. If a harrow is used the teeth should lie back nearly flat, or some of the tiny seeds will be buried too deeply. If no water is available a common practice is to run drag harrows through the orchard and then sow the seed without any subsequent brushing at all. Sow it right on the dry ground ready for the first good rain. This is as good a plan as any apparently, except in the "blow-sand" districts. These must have moisture to settle the surface firmly till the seed is fairly started, and even then it is a pretty hard job to establish a cover crop on light sand. On strong silty loam soils twelve pounds of seed is often found enough; on sandy loam and bench lands it is safer to use 20 pounds. For it is better to have a proportion of plants choked out by overcrowding than to have an insufficient plant.

Vetches and Rye or Barley.

Vetches do well almost anywhere where the ground is in good heart. On thin sandy soil a manuring may sometimes be necessary to get them started in making a good cover crop, or perhaps a crop of roughage turned under. The second year of sowing they generally make a better showing than the first because of the improved condition of the soil from the previous year's crop. This crop has (probably temporarily) fallen from favor in some citrus districts because of injury from aphids where continuous planting of this legume without change has taken place. Its mechanical action on the soil, especially through its fine root action, together with its high manurial value, gives the vetch a very high standing though.

The cost of the seed at present constitutes some drawback. Yet all the available seed finds a market each season. The amount sown varies with the quality of the land. On strong silty, well-drained loams, 40 pounds of vetch seed and 10 pounds of barley or rye will often give a good stand. On poor ground, from 60 to 80 or 90 pounds is needed and 20 to 30 pounds of barley or rye. The grain is used to help hold the crop from "lodging," and rye is often given the preference, because it has a deeper root system and a stiffer stalk. Also it does not stool so much as barley, which under good soil conditions and with plenty of room, may stool into such large crowns as to choke out a lot of vetches. These do better in the drill than broadcasted.

To Plant Vetches and Rye; Also Peas.

With the average dust mulch left at the end of the summer, a good cultivation ought to put the orchard in shape to drill or broadcast. If a plowing is given it should be shallow—say, four inches, especially in sections of light rainfall and on adobe soil. The roots of both vetch and rye will penetrate the firm seed-bed left and are less likely to dry out if a long dry spell follows the first rains. The drill rows can be left without subsequent harrowing if the ground is right to drill. If broadcasted, heavy-drag harrows should be used so as to get the seed under at one operation and not harrow twice.

Canadian Field Peas.

Peas should always be drilled and

plenty of seed used—say 100 pounds. Like vetches they thrive better with close companionship. They should be drilled in pretty well, for the birds and mice will take toll of them to some extent. They stand the winter well generally if the ground doesn't

get waterlogged. There are always a few new men who think cow-pea and Canadian field pea the same thing. A cow-pea is a bean and cannot be planted till spring opens up: the frost gets it.

(Continued on page 385.)

The **CHEMIST** says—
"genuine **GIANT** is
always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives. When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 52 pages are full of short-cuts and labor-saving methods.

The Outlook for Marketing Fresh Grapes

(Written for Pacific Rural Press.)

In 1915 only 750 carloads of wine grapes were shipped out of California. Last year 6,000 cars were shipped. This year, if cars can be obtained, 16,000 carloads will be sent East. This, together with 16,000 carloads of table grapes, means 32,000 cars for grapes alone without counting apples and other fruits and perishable imported commodities, and we are lamentably short of cars to move it all. This is what leaves growers up in the air. They don't know what to do. Five hundred cars a day are needed for 60 days on grapes alone.

"There has been a tremendous demand from Eastern buyers for fresh wine grapes," says Frank T. Swett, President of the California Grape Protective Association. "The key to the situation is the number of refrigerator cars that will be available for this purpose during September and October. A committee of the Association, together with the State Market Director held a conference with Mr. Cowen—in charge of the Pacific Fruit Express refrigerator service of California. Their deductions as a result of the interview were as follows:

"Apparently the refrigerator service is not going to be equal to the demands throughout the State during the next two months. The proportion of the demands that may possibly be met were roughly approximated at two-thirds of the requirements. This estimate is made, however, with reservations and emergency conditions which may seriously affect the result.

"Mr. Cowen estimated that possibly 250 refrigerator cars of the Pacific Fruit Express would be available daily for all purposes. If this were all of the supply, then there would indeed be a great shortage of cars, but the Santa Fe will make every effort to supply as many cars as possible and also a limited number of Great Northern, Illinois Central and Armour cars may also be available.

"The apple movement out of Watsonville and out of the northwest section of the country will require a great many cars and an abnormally large crop of table grapes in California awaits movement during the next sixty days. If 16,000 cars of table grapes are to be moved out of the State, and if the same number of wine grapes in fresh form should also be demanded for Eastern shipment, we would be up against a condition with which we could not cope successfully with refrigerator cars, and it will be only guessing if we endeavor to estimate what proportion of such a tonnage might be moved in fresh form.

"The committee spoke with Mr. Cowen about shipments of fresh grapes late in the Fall in stock cars and in ventilated cars, thinking, if possible, that these cars might be used in case the weather became cold. It developed that there is also a great shortage of these particular classes of ordinary cars and apparently there is no considerable amount of relief to be expected from that angle of transportation facilities.

"The question was asked particularly what the position of the small grower was in the matter of ability to get cars as against the extensive shipper, whose requirements might be 1,000 cars in a season. The committee was assured that the individual shipper, whose demands might be as little as 10 cars during a season, would get his proportion of available cars during the shipping period, no matter how remotely situated he might be from main line terminals and junctions. However, there can be no definite promise given to anybody and the shipper who contemplates moving his grapes East, whether he be moving table grapes or wine grapes, is confronted with a situation of much uncertainty.

"To this statement we should add that in making application for refrigerator car service, the growers should specify that they wish cars for fresh grapes. It is not necessary to state, nor is it desirable, that the cars are wanted for either table or wine varieties. The request should be made

merely for GRAPES."

In reply to a telegram from Col. Harris Weinstock, State Market Commissioner, to W. L. Barnes, Railroad Administrator, the following message was received:

"Replying your telegram fourth, indications are, will be able to maintain movement refrigerators into California, average 300 per day, during September and October. Under favorable conditions may be able to increase this number. Assure you every possible effort will be made to increase supply consistent with requirements refrigerator cars into other territory. Please understand this is only estimate and carries with it no definite promise."

This is the situation as it stands.

MONTEREY COUNTY FAIR.

For the first time in fifteen years, Monterey county is to have a county fair, October 10 and 11, at Salinas. The movement is being pushed by the Farm Bureau through Farm Advisor T. C. Mayhew, and has the support of farmers in all parts of the county. Each Farm Bureau center will have a community exhibit here. It is strictly a co-operative affair, carried on in co-ordination with the women's clubs, the business men, and the schools and will therefore be an agricultural, industrial, and educational concentration representing the entire county. Livestock will be shown on the Rodeo grounds, and other products will be housed in a new garage, which will be ready by that time.

It is estimated that 1,000,000 acres are available for rice planting in the Sacramento valley.

HOW SHALL I LAY OUT A VINEYARD?

To the Editor: I am contemplating planting 40 acres to grapes, and wish your advice. Would you plant more than one variety? If so, what would you plant and why? I am figuring on Thompsons if I plant only one variety, so you can use them as a base. I have my land leveled and ditched, electric motor $7\frac{1}{2}$ H. P. and 4-inch pump. Land lies oblong—half a mile long by a furlong wide. Practical vineyardists in this section say the land is good for grapes. Give me your ideas as to spacing. I have been advised 6x12, 8x12 and 10x12 for Thompsons.

Now, as to a method of financing planting, Japanese here offer to put in vines, cultivate and harvest for crop in that period—allowing them to intercrop the first year and maybe the second year. I am to furnish all tools, horses, water, stakes and wire—they to furnish vines and labor. What is your knowledge of contracts of this nature? Can you refer me to any contracts in this line?—A. S. M., Tulare.

It is taking rather a long chance to advise, especially at this distance and without knowing your location, character of the soil and water supply. You are figuring on Thompsons as a base. That seems wise, for you will have a good crop in three years to keep the pot boiling. Put them on your sandiest soil. As I consider Muscats will always be the backbone of the raisin business, I should want to plant the balance to Muscats and put them on your strongest ground. The present prices being obtained for Emperors, Malagas, Feherzagas and Almieras might tempt you, however, to put in a few acres of one of these varieties. Not more than one or you will mess up your shipments on small lots. On good ground you can plant your Thompsons 8x12 and still have room to work your rows with a small tractor by careful driving. 10x12 is needed for a larger tractor. If teams only are used 8x12 is enough. Your most economical way of working for picking and irrigation would be to cut in two in the middle rather than work long ways. Half a mile, however, is too far to run pumped water profitably.

With regard to your last question about working and financing the project, the Japanese offer is out of all conscience. Let us take the planting. The cost of your young vines, planting and all, should not exceed \$30 an acre, i. e., allowing 558 plants to the acre. As a farmer you yourself know the cost of working the land. By the third year your Thompsons will give you heavy returns, if properly cared for. Except under your own supervision the Thompsons would receive all the care and the Muscats would be neglected except in so far as it paid the tenant to care for his intercrop. I would advise you to see Chas. F. Collins, Horticultural Commissioner at Visalia, who may help you out and have personal knowledge of trustworthy men. But in any event you must reserve in your own hands the right to supervise and insist on correct management. It is the only way to insure against failure.

LUMBER FOR BOX SHOOK.

Millions of feet of lumber are going into box shook each year for transporting fruit to market. The boxes are destined to be split up for kindling, for transportation of returned empties would be impossible. If definite plans are not perfected and carried out for reforestation of cut over areas, the grower will awake some day to find himself shy on material in which to ship his fruit. The Fruit Growers' Supply Company are "wise in time" and have made the first step in the right direction in the purchase of 41,000 acres of timberland in Lassen county. State and Federal laws are needed to provide the power and machinery for enforcing the replanting of cut over land on a safe and scientific basis, with adequate supervision. We could learn something from Germany in this respect.

Beet sugar production in the United States is estimated at 1,750,000,000 pounds this year as compared with 1,025,000,000 in 1910. The cane sugar crop is unusually low—perhaps one-fifth of the total output of the country.

The Biggest Day's Work—?

At sundown—is your tractor still going strong—has it done the biggest day's work that a tractor can do? Does the engine pull to capacity every minute of every day?

Tractor performance is largely governed by ignition. It is a proven fact that the searching strain of farm work necessitates magneto ignition. And in Bosch Magneto Ignition, magneto dependability reaches its greatest development.

With Bosch High Tension Magneto Ignition, hot, intense Bosch Sparks flash to the plugs—accurate to the thousandth of a split second. Whether you burn kerosene, distillate coal oil, tops or gasoline in your Tractor, Truck, Automobile or Gas Engine, Bosch Sparks get every atom of power from the fuel. Bosch Economy and Bosch Dependability have been proved through years of Supreme Service.

Get a convincing demonstration of Bosch Superiority from your dealer. Every dealer is backed by the Bosch Service Organization. Over 200 Service Stations in more than 200 centres are always ready to give you complete service.

Here and There in the Fruit Business

Light Yield of Melons.

Cantaloupes, Honey Dews and Casabas are about cleaned up for the State. There was a very large acreage, but a light yield.

Wine Grapes Wanted.

There is an unprecedented demand for wine grapes, according to the Lodi Sentinel, at least 60 outside buyers of Zinfandels being on the job in one week. The price seems to stand at \$30 and at present there is no indication of a car shortage. Growers have nothing else definite in view as a general thing, still a certain number are waiting for something better to turn up.

Forestry Needs Backing.

We have had an abnormal number of forest fires this year and our timber supply is rapidly decreasing, much faster than is realized. The forestry booth at the State Fair had models showing how disastrous losses took place from fires started by cigarettes thrown from a passing auto or unattended camp fires. A complete county fire outfit was shown as used by local organizations. This instructive exhibit leaves a deep impression and impresses the onlooker with the importance of definite steps being taken for reforesting cut over areas and safeguarding

our natural growth of timber.

California's Peach Crop.

"The peach crop of America will not be more than 30,000,000 bushels," according to Homer B. Fairchild, Pomologist, U. S. Department of Agriculture, "and of that amount California will produce 16,000,000 bushels. California is more nearly free from peach tree diseases than any other State in the Union. In ten years Georgia's crop has fallen from 4,200,000 bushels to 2,700,000 because of 'peach yellows'."

Raisin Grape Harvest Is On.

Muscat grape picking is now in full swing in the raisin districts, and every picker is needed. There is a nice yield and the crop is of fine quality—up to earlier expectations it is reported. Picking will be done as fast as possible. The Associated Raisin Co. is helping growers in determining the quality of their grapes before picking. A hot spell reduced the crop to some extent, but the harvesting weather is excellent.

Pears on Quince Root.

George Payne of the Moorland district in Santa Clara county has 1500 pear trees from one to four years old—all Beurre Hardy on quince. Half of them he will keep in a block as they are and the other half he will work over to other shipping pears. They are headed low and will be kept low on the dwarf system. We mentioned a very successful orchard of this type some months ago owned by Frank T. Swett of Martinez, which carried a twelve-ton-to-the-acre crop this year on eleven-year-old trees—mostly picked without a ladder.

Plant Injury from Impure Potash.

The United States Department of Agriculture has received complaints regarding injury to crops apparently resulting from the use of imperfectly prepared domestic potash. At least one company operating at Searles Lake permitted a considerable amount of potash to go out in 1918 with a high percentage of borax, averaging probably 10 per cent, some samples going as high as 23 per cent. The Department has been conducting careful investigations of the matter in the field, which indicate the substantial correctness of many of the complaints.

The Turlock Canteloup Season.

Approximately 4,000 cars of cantaloupes, honey dews and Casaba melons were shipped from Turlock this season, to say nothing of watermelons, according to the Turlock Tribune. Yet the season was not a successful one. The melons this year had not the carrying quality of former years. This condition, coupled with delays in transportation, brought the fruit to market often in poor condition. Some cars took 21 days to make the trip East to New York, and from 12 to 14 days to Chicago, which should have been done in 7 or 8.

Rules for Loganberries.

Clean up Logans as soon as the crop is off—prune out the old canes. Anthracnose is detected by spots on the stems having a pale center with irregular brown or black margins. These spots vary in size and color. Spots on the leaves have a pale center with reddish or purple borders. If fruit is attacked it dries up when half green. New growth will be affected if the old vines are left on till spring. According to experiments already published, spraying with lime sulphur or Bordeaux should take place in February and then again six weeks later. Lime-sulphur, 5 gallons to 100 gallons of water or Bordeaux 4-4-50. Summer strength lime sulphur, three gallons to 100 of water, or even 2½.

Lime and Legumes.

It is about time to get that lime and get it on the ground. If the land needs lime about one ton of hydrated, or up to two tons of carbonate of lime to the acre, is enough. About once in three or four years is often

MOLINE

WIDE SPREAD SPREADER

With Straw Spreading Attachment

With this spreader you can drive through doors and narrow places, as the box is only 38 inches wide, yet you can spread the manure in a wide even sheet.

It is low down, easy to load, strongly constructed, light in draft, and the second beater thoroughly pulverizes the manure, spreading it in a wide, even sheet beyond the wheel tracks. One lever operates the entire spreader.

This spreader can also be equipped with a straw spreading attachment which is illustrated here. It is easily attached and spreads straw in a wide, even sheet, as thinly as you desire, even on windy days.

Straw is worth from \$4 to \$8 a ton as fertilizer and as a top dressing for winter wheat.

You can make more profit from your manure and straw with this Moline spreader.

See your Moline Dealer now about getting one or write us for full information.

enough to lime the ground with a good dressing unless very heavy applications of manure are applied. A dressing of lime every year would wear out the soil too quickly. That is why the old adage started, "Lime makes the father rich and the son poor." Use discretion along with the lime and father and son both profit. An old guy who lived over 2,000 years ago said, "The abuse of God's bounties does not forbid their use by reasonable men." This is a very free translation of his actual words.

Glenn County's Young Orchards.

One thousand acres of almonds came into bearing this year in Glenn county, according to Hugh C. Wren, County Horticultural Commissioner. An average of eight pounds of nuts per tree has been obtained from four-year-old orchards. There are 500 acres of prunes coming into bearing this year. Many five-year-old orchards averaged five and a half green tons to the acre. The total plantings of almonds and prunes in this county comprise about 3,500 acres for each.

Jujube trees obtained from the U. S. D. A. Plant Introduction Gardens at Chico, and grown at Hamilton City by the Mills Orchard Co., also in the Cadara district, furnished 35 pounds of fruit this year. Fair-sized commercial plantings are to be made in the near future, said Mr. Wren. The fruit is of good size and quality and cures like a date.

SEEDING TIME FOR COVER CROPS APPROACHES.

(Continued from page 381.)

Barley and Burr Clover.

Burr-clover seed is very scarce this year. This is a pity for it is California's natural cover-crop of the legume family and one of the best. A good way to seed this crop is to harrow in from 15 to 30 pounds of barley—right in the dry ground, and then sow from 15 to 20 pounds of hulled burr clover seed on top and let it go at that—no more harrowing. If you have some unhulled burr clover that you have swept up—use about 75 pounds of it to the acre, if possible, as there will be a lot of trash in it.

Horse Beans.

The large horse beans we have make it necessary to put on plenty of seed for a good stand—even 200 pounds. They may be drilled if you have the right tool, or plowed in—dropped in every third furrow, say four inches deep. They need a strong soil—it is a waste to put them in poor ground and expect much. On the right soil they are wonderfully good. They have a deep, strong, penetrating top root, which aerates the soil and large plants will carry nodules the size of a small hazel nut. The drawback is their liability to black aphids which attack the terminals. These aphids look like the black cherry aphids. It is possible that we are within distance of control—if so, this crop is a "comer" in the future when we can get the right bean, and we can.

Cost Per Acre.

Melilotus indica (sweet clover) can be bought at \$11.50 per 100 pounds—(a poorer grade at one cent less). Thus the seed would cost \$1.70 to \$2.15, an acre, and a man can seed pretty well two acres an hour without hurting himself. This is alike the prime favorite over the largest area and the cheapest in point of application.

Spring vetches are \$12 per 100 pounds (\$11 in ton lots). They will be lower in price in November, but nobody would willingly waste a valuable growing period for a dollar. Rye is \$5.25 per 100 pounds (5 cents in half-ton lots), which brings the seeding to from \$4.90 to \$10.30 per acre. Hairy vetch is not so suitable for cover crops as it does not start so well till the warm weather comes. Canadian field peas will cost probably six to seven cents a pound, or, say around \$6 an acre.

Burr clover is not quoted, and we don't yet know who has any. It may cost \$3 or \$4 an acre for seed, but men who value it probably would not switch for a dollar. Horse beans might cost \$10 an acre to seed, but the seed companies may have some good for "cover" at a bargain.

ALL AVERYS
ALL K-W EQUIPPED

Six Years Ago
The Avery Co. started using

High Tension MAGNETOS

Today
K-W is standard equipment on all models, because of their proven Reliability and Efficiency

Ask the Avery Owners near you

To Get Greater Crops — Plow Early — and Deep

OWNERS of Avery and other K-W equipped tractors plow at **less cost** because of the efficiency and reliability of K-W Magnetos.

The thing you should look for in a tractor is abundant power, economically generated and applied. Fuel properly carbureted to gas **plus** a hot, intense spark means **power** when efficiently delivered through a well-constructed tractor.

The K-W Magneto gives a spark so hot, that instant and complete combustion and full power is assured from every drop of fuel, regardless of how poor the grade. This added power makes deep plowing in

hard ground easy, and because leaner mixtures can be fired without loss of power, greater acreage is plowed **at less fuel cost.**

Nine years of service on tractors has proven K-W Reliability in every weather and working condition.

You buy a tractor to get greater crops at lower cost. In choosing your tractor make sure its magneto bears the K-W trade mark. Write for list of K-W equipped tractors and illustrated booklet — "Plow This Additional Acreage Without Fuel Cost."

The Gasoline of Quality

WHAT WILL THE HARVEST BE—OF 1919 PRUNES?

(Written for Pacific Rural Press by Jno. J. Fox.)

Although this year produced unusually large prunes in all prune-growing sections, especially those on almond root, the fruit has been drying light, and results are disappointing. Prunes that looked like 60s on the tray have panned out 80s or smaller. Some men claim their fruit dried away pretty well 3-1 in the valley sections. The Richmond Dried Fruit Company put their drying at 2.68-1 and 2.50-1 is common. The early pick did not sugar up well and is of poor quality, though the main crop is good. There was a very large number of muddy-colored prunes and bloaters and hand-picking the trays led to a tremendous expense.

The first two weeks of the prune harvest first-class drying weather helped us out and kept us going with plenty of trays. Then the prunes dropped very rapidly everywhere—in many orchards it was impossible to keep up with them either in regard to trays or pickers.

A shower of rain in some sections made drying slow for about a week as the atmosphere was heavily charged with moisture. By the time this article appears most of the fruit will be on the trays and shaking for the clean-up will be general. Trees have been holding their foliage well right up to now except where moisture was lacking or red spider had been prevalent. We were in a number of orchards during the week ending September 13—just one year after last season's visitation—and found everybody busy and good-natured.

The Sorosis vineyard at Saratoga has about the same crop as last year. Frank Abernathy, the manager of the company, says his own crop and the company's will total about 600 tons of dried prunes. Last year he only saved 75 tons—the rain took the rest, so there is one year's loss to make up. He is paying \$6 a ton (green) to have the fruit picked up and contracts to have them dried by a gang of Japs at \$4 a green ton, doing the hauling and handling in bins and attending dipper with his own men. This will equal about \$30 a dry ton in the warehouse. He has 15,000 8-foot trays. Mr. Abernathy sold his prunes at 15 cents and will have the greater part of the fruit cured in another week.

Is the Grower a Real Profiteer?

(Written for Pacific Rural Press.)

To the Editor: Who is responsible for the high price of our daily bread? The consumer in the city has been told it is the producer or farmer. The farmer knows that the cost of operations has doubled and even tripled, but the net returns on his produce has in many cases increased but little. Traveling in the country a great deal, I have had occasion to observe that in many orchards fruit is going to waste that ought to be made available to the city worker for food. I had often speculated on the whys and wherefores of the high prices of fruit in the city when I saw fruit going to waste on the tree in the country. I bought a small orchard on which are fruits of many varieties, all of them

good for food. I have a few trees of apples, cherries, plums, peaches, figs, walnuts, and some berries—all bear profusely. I thought this fruit would be worth money. So I sprayed the trees, cultivated the ground, and took what I considered good care of the place and began to make my plans to dispose of the crop. But when the fruit began to ripen and I had to sell I began to learn something.

The early peaches came first. These I sold to some friends at a fair price, so I was happy. Next came the cherries; for these the canners paid nine cents per pound. I didn't have very many, so the cost of picking and hauling did away with my hopes of a profit. Next came the Early Crawford and then the Elberta peaches. To dispose of these I called a local dealer by telephone, told him that I had peaches which I would like to sell; but was advised that he was overstocked, and suggested that perhaps he could use them a week later, but my peaches were ripe and had to be made use of, so I sent 10 Los Angeles lug boxes full to a San Francisco commission house. Here are the returns those peaches brought:

10 Los Angeles Lugs Peaches—	
Price, 75c	\$7.50
Express	1.71
Commission	1.13
Boxes furnished35
Net	\$4.31

These peaches were carefully packed and culled, so that the consumer might get something good for his money. He paid \$1 per box for these. Here are the returns on the next shipment—38 lugs, of which 36, reached destination (two were broken by expressmen):

36 Los Angeles Boxes Peaches ..	\$27.00
Express	11.03
Boxes Furnished	1.26
Commission	4.05
Net	\$10.66

On this last shipment the local express office made an overcharge of about 1000 lbs. I have taken this matter up and filed a claim to have the Express company reimburse me, but they are taking their "sweet" time about making a settlement.

But why go into all this detail? I have done it to show you, Mr. Consumer, in the city, that it is not the farmer who is getting the "lion's share." Where I, as the producer, got a fraction over one cent per pound for my fruit, you paid five. Who got the four cents? Study the foregoing statement; it will tell you.

What are we going to do about it? I shall graft all my trees so far as practical to one variety of fruit, preferably prunes, and dig up those that can't be so grafted. You will have to continue to pay the high prices, not

to the farmer, but to him who handles this fruit after it leaves the farm. If the small producers could form some kind of co-operative marketing association that would efficiently take the farm produce and place it at the consumers door, it would help to eliminate the feeling of discontent in both the city and country. But my final appeal to you, Mr. Consumer, living you do in the city of crowded, dust-swept streets, don't blame me as a farmer for the high price of the fruit that you eat.—H. J. B., Napa.

Hop pickers are being paid from \$5 to \$6 a day.

Get Him
with a
Savage, Boys!

CROWS are causing a lot of damage to crops throughout the United States and are the greatest pests among birds.

Take a Savage Junior Rifle and one or two of your friends, or better still, organize a Boy's Shooting Club in your town and help exterminate the Crows. Some counties are paying a bounty for them.

Be sure to get behind a straight-shooting .22 Savage Junior single-shot Rifle and you'll be the best shot in your neighborhood.

Remember, "you'll always find a Savage where the service is the hardest."

Ask your dealer to show you one or write us for particulars.

SAVAGE ARMS CORPORATION
UTICA, N. Y.

Sharon, Pa. Philadelphia, Pa. Detroit, Mich. New York, N. Y.

.22 calibre Savage Junior. 18-inch round barrel single shot model. Shoots .22 short, long, and long rifle cartridges. Built according to model after best military rifles. Genuine walnut stock with steel buttplate. Removable front and adjustable rear sights. An arm which wins the respect of experts.

The Famous Hardie Junior Is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, weight, and upkeep. It is big in real value, engine power, pump capacity and ability to do successful spraying. We believe this is the greatest small power sprayer ever manufactured, and placed on

the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with 1½ horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR \$315. Delivered Anywhere In This State.

If truck is not needed, deduct \$55.00. These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production. If you are interested in other types and sizes of the **HARDIE POWER SPRAYER**, write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufacturer.

The **HARDIE ORCHARD GUN** is \$12.00, none better. Every one is guaranteed to give satisfaction to the user, or his money refunded. The Hardie Spray Hose is the safest hose to buy.

THE HARDIE MANUFACTURING COMPANY

224 N. Los Angeles St., Los Angeles.
H. V. Carter Motor Co. Hardie Agt. San Francisco, Cal.

HORTICULTURAL JOTTINGS.

A sixty-three acre vineyard at Fresno has just been sold for \$32,100.

As a result of high prices on labor and fruit, it is predicted that canned peaches will bring 60 cents a can this winter.

A girl named Margaret Myers of Marysville is said to have earned from \$14 to \$20 a day pitting peaches—a peach of a pitter!

The grape growers of Placer County are now busy shipping. One firm of lumbermen sold ten carloads of lug box shook the last two weeks in August.

"No appreciable loss of green fruit" is reported from Clovis, Fresno Co., due to the railroad strike, and all hands are busy again picking and packing.

Miss Etta Corey of Visalia has been making \$15 a day as a peach packer. Her record for this season is 82 boxes in 9 hours, which at 20 cents a box amounted to \$16.40.

Twenty acres of Valencia Oranges have just been sold near Anaheim for \$50,000. Charles Latimer, proprietor of the San Antonio Orchards of Ontario, is the purchaser.

The Associated Raisin Company shipped a car of new crop Thompson Seedless Raisins to Chicago Sept. 2—the earliest shipment on record. The car contained 2200 cases.

In Napa and Sonoma counties the prune crop is all on the trays, except a number of stick-tights that refuse to leave the stem. The amount of

these totals up to some tons of fruit is a number of orchards. They seem to lack sugar and a good many will never be recovered.

Apple-packing demonstrations will be held in Santa Cruz county on September 22 and 23rd, under the auspices of the County Farm Bureau. Good stuff!

Good weather has prevailed for the raisin harvest in the south, which is some relief to the general shortage of labor. Growers will feel uneasy until the season is over.

The American Fruit Growers, Inc., a \$50,000,000 corporation, is in process of absorbing the American Fruit Distributors of California—a San Francisco corporation.

Tuscan peach trees are practically off the market and the supply of other commercial cling peach trees is very limited, it is reported. Some planters are likely to be disappointed this year.

At the meeting of grape growers and prune growers at the University Farm at Davis, September 13, a large number of visitors were present to see the new experimental grape dehydrator.

The car shortage seems to be likely to continue for awhile though ameliorating conditions may be looked for in another week we understand. But still, another week will see an increased demand.

Shortage of cars is so serious that Governor Stephens is taking a hand in trying to give relief by applying to the head of the Railroad Administration. Only about 25 per cent of the

grapes in the San Joaquin, Placer and Fresno county grape centers were being served September 12th, it was said.

Fifty carloads of wine grapes were purchased in one week at Oakley (Contra Costa county) by E. B. Sellars at \$45 a ton—a record for this district.

The Almond Growers' Exchange has increased its membership from 2,400 to 3,000 in the past year. Seventeen per cent of the members are in the Chico district.

Nearly 9,000,000 pounds of evaporated fruits from the army's surplus supply were available September 6th for purchase by municipalities, etc., for distribution.

Government prunes are being sold in San Francisco and Portland at 11 cents a pound—the average price paid by the government. Five hundred and one thousand pounds were released in San Francisco alone.

First prize for best exhibit of counties of county products at the State Fair went to Yolo county; second prize to Fresno; third prize to San Joaquin; fourth to Kings; fifth to Solano; sixth to Alameda; seventh to Placer, and eighth to Humboldt.

In a recent issue of one of the large dailies the public was informed the raisin growers would make a profit up to \$2,500 an acre gross this year. The latest estimate of the raisin crop is 180,000 tons from 180,000 acres. With raisins at 10 cents a pound we cannot follow these figures. It looks as if \$50 were added and then the typist gave the 0 an extra tap for luck.

PRUNE-GROWERS' ASSOCIATION ADVERTISING CAMPAIGN.

(Written for Pacific Rural Press.)

The California Prune and Apricot Growers' Association has prepared its plan of campaign for the coming season's advertising. Like the other great growers' organizations, the advertising department is getting ready to push California prunes and apricots by publishing full-page colored advertisements in the national magazines. The persistent quest for new markets and ever-widening consumption is one of the most important functions of our growers' organizations—that and their ability to safeguard the consuming distributor against loss due to speculative dealing. For it is only by uniting that we are able to guarantee a price against decline and it is only by united efforts that we can advertise and extend our fields of consumption. "It pays to advertise" is no idle proverb, but the true word.

Greater consideration is paid in the setting of prices by our Boards than we wot of. They can be adjusted but not until the guaranteed period is passed. If the price set is too low the association might "get one below the belt" by sharp buying on the part of the independent packers from "outside" growers. If the price set is too high, consumption falls off, certain consumers will get out of the habit of eating the too-high-priced stuff, and the main selling period slides by. As it is, sales of all our dried fruits are reported as proceeding very nicely, showing "Advertising Pays."

True Value in Hosiery is Measured by the Extra Wear it Gives

It is one thing to get good looking hosiery—and quite another to get hosiery with long-wearing value. You get both when you buy Durable-DURHAM. To know the true value of this hosiery is to save on your stocking expense. Money is saved with fewer new pairs to buy—and the trouble of darning is avoided.

Durable-DURHAM wears longer because it is made stronger. The Durham dyes do not fade and the stockings keep a long lasting good appearance. Best of all, it is reasonably priced. And meets every stocking need. Styles for men and women include all fashionable colors and come in all weights from the lightest hosiery to the thick, warm, fleecy lined hosiery for winter wear.

DURABLE DURHAM HOSIERY
FOR MEN, WOMEN AND CHILDREN
Made Strongest Where the Wear is Hardest

Every pair of Durable-DURHAM Hosiery is extra strongly reinforced. The legs are full length, tops wide and elastic, soles and toes are smooth, seamless and even. Sizes are accurately marked.

Look for the trade mark ticket attached to each pair. You should be able to buy Durable-DURHAM Hosiery at any dealer's. If you do not find it, please write our sales office, 88 Leonard Street, New York, giving us the name of your dealer.

DURHAM HOSIERY MILLS, Durham, N. C.
Sales Office: 88 Leonard Street New York

GLORIANA (Banner)

All year wearing stocking. Softcombed yarn, fine finish. Extra fine gauge. Wide elastic tops. Strongly double reinforced heels and toes. Black, white, cordovan.

Bethlehem

SPARK PLUGS

Specialists

BETHLEHEM Tractor Spark Plugs are expressly built to meet the unusual requirements of tractor service. They are specialists.

Our engineers have carefully studied these requirements.

They have made extensive tests, both here in our own shops—and in the tractor motors themselves, out in the fields, under the most difficult working conditions.

They have developed a line of tractor plugs—for no one plug will meet the requirements of all tractors.

Consequently there is a type of Bethlehem tractor plug for every type of tractor motor—each plug more efficient in its particular field than any other we know of.

Get Bethlehem tractor plugs from your dealer. He knows which model is best suited to your particular make of tractor. He also carries Bethlehem plugs for motor cars, motor trucks and stationary engines of all types.

The LAUSON Wins Again

at Grand Forks, N. D.

All gears, including the final drive, are fully enclosed in a dust proof housing on the Lauson.

The city council at Grand Forks needed a tractor for road work. In order to determine the tractor best suited they had a competitive demonstration of the leading makes of tractors.

The LAUSON was selected as the tractor most perfectly qualified for the hard service entailed in the work of road-making. The important feature of the LAUSON in this connection is that all the working parts are completely enclosed. This keeps out the dust, dirt and grit which are ever present whether the tractor is working on the road or on the farm. By keeping the dust and dirt from the gears there is no loss of power through friction. There is no grinding of gears by emerylike dust and the possibility of breakdown and wear is thus minimized.

This is one of the features which has helped to make the LAUSON the "Pattern Tractor." If you would like to know the others we will be glad to send you full particulars on request.

Practical Pointers on Farm Irrigation

(Written for Pacific Rural Press by D. J. Whitney.)

THERE ARE TWO WAYS of getting water for irrigation. The first is to take it from rivers and streams and to bring it to the land in canals and ditches, using reservoirs and all possible means to obtain everything in the way of water that nature can supply. This ought to have a high place in public policy, state, national, and local.

The second system is to take water from wells by pumps. This is an affair of the individual farmer, but there is much of public importance to the matter also. The more water that can be brought to land by canals, the higher the ground water will be and the less difficulty and expense in pumping. Also, in districts supplied with water from the mountains pumping plants are going in by the hundreds to take care of the periods when canal water gives out. Canal water helps the wells; wells help the land when the canals are dry. Ditch water raises the level of the ground water; wells lower it. The two plans fit together to perfection and even in irrigation districts the pumping problem should be well understood.

Most writing about pumping has been done by agricultural engineers, who seem to have left out the important little matters that a farmer ought to know. The facts which are set down here are based upon experience and observation in the Fresno and Tulare sections, where everything is irrigated and where the only ditch is a small, privately-owned one.

As to the Well.

A very common mistake seems to be to sink too shallow a well. Well-borers have disliked to work too deep; they figure it is easier to quit while working is easy and move to another job than to toil along a few feet a day, even if they are paid well for deep work. Therefore, they have stopped often when the well showed sufficient water for conditions at the time. Afterwards, along came some dry years, other wells drew down the water, the wells did poorly, and everything had to be dismantled in order to sink the wells deeper. So, as to the first point, in putting down a well, leave a comfortable surplus of depth for use when some future dry spell comes. Furthermore, the quicker and easier water can pour into the well, the less the water will drop when you are pumping and the greater the flow from the pump and the less power used per gallon.

Rigs for Well-Boring.

Well-boring is an interesting proposition. Three kinds of rigs are found in this vicinity. First are hand rigs, operated by two or three men, using derrick, windlass and rods on an overgrown soil auger. This is simple and inexpensive. For shallow wells these rigs are hard to beat for economy. Holes 150 feet or more can be put down with them, but the operators seem to like to quit before they get down that far. There is a horse rig used in the vicinity, with rods and augur, like the hand rigs. It is a gold mine to the owner, who lets his horses do all the hard work and makes fast time at it.

One flaw in the boring system is that a cobblestone will quickly get the auger going to one side and before long the well is frequently "as crooked as a dog's hind leg," as the operators of the third kind of rig say. Whether this crookedness is a serious matter or not, depends upon the diameter of the well and the size and depth of the suction pipe going into it.

Power Machinery for Well-Drilling.

Finally there is the steam and gas rigs for drilling wells—big, expensive machines, making a hole as straight as a stone will drop and as deep as a cable will reach. They remove the dirt by churning it to a paste, then pulling it up in a sand pump; a slow process in comparison with the boring equipment, which cuts off slices of dirt and shoves them into the auger. Even a hand rig will run away from a big expensive power outfit in the speed of digging a shallow hole, and the cost will be insignificant in comparison. However, when it comes to deep work, the boring equipment is out of the running and a drill has to be used, so if any one is doubtful about the kind of a rig to hire, this summary may help them. The drill can pass by small stones that will make lots of trouble for a boring rig; they can even go through granite, but when a man strikes granite he had better quit. He will be poorer in

pocket and about as poor in water below the granite as above it.

Underground Water.

As to depth of wells, there seems to be little advantage in sinking them too deep. This all depends upon the streaks of sand struck. Wells with only thirty to forty feet of standing water seem to be giving a big flow of water in this vicinity for three-inch centrifugal pumps, when there is a good thickness of water gravel at the bottom. If the sand streaks were poor and thin and the formation mostly clay, from 60 to 150 feet of standing water might be advisable.

Old wells in this vicinity, and in many other places, continue to send up fine sand continually. Each particle of sand removed creates a reservoir beneath the surface and opens up channels between the gravel through which the water seeps on its way to the well. This is one reason why a streak of thick water gravel, 30 to 40 feet below the natural water level in the soil, will give a wonderful stream. Say that the water sucks down 12 feet in pumping, there is then in the water gravel a pressure of about 12 feet from all sides, forcing the water through the channels in the gravel toward the perforations in the casing and into the well.

Too Much Sand.

When the sand strata are too thick, and some wells go through nothing but sand, wells are ruined or badly injured by the casing giving away under the pressure of the sand. Recently the writer was on a ranch where apparently this trouble had occurred and advised the owner in getting the damage repaired to look up the matter of redwood casing for the wells. Redwood will not decay when kept permanently moist, while metal casing in time will be weakened by the water and hard pressure will cave it in.

There is one other point about a well in connection with sand and depth. The thicker the sand stratum the quicker will sand find its way into the well and sink to the bottom. It even may block up a sand stratum, particularly when this is at the extreme bottom of the well. If it fills up to the bottom of the suction pipe it will check the flow of water. Consequently, and from personal experience, the writer would always advise having sufficient depth between the bottom of the pump (or suction pipe) and the bottom of the well, to permit the deposit of lots of sand without reaching the pump intake.

Cleaning Out Wells.

If wells have to be cleaned, sand pumping is a simple proposition, but may be expensive and troublesome to clear things away for sand pumping and to get the plant in working order again. The longer a well will go without being interfered with the better. There is no use getting a well too deep, but lots of use in getting it fully deep enough.

The grain fields around Stratford are being plowed day and night, preparing the ground for early fall seeding. The congestion at the warehouses is relieved, as for some weeks the train of teams has extended a half-mile out from each warehouse. The Gyp corn planted along the edge of the Tulare Lake as it dried up, is looking fine.

"One Good Investment is Worth a
Lifetime of Labor."---Milburne.

IN LESS THAN SIXTY DAYS OFFICERS OF THE Virden Packing Company

Feel confident they will have complied with the Permit issued by the State Commissioner of Corporations (which requires the sale of the first two million of its authorized capital before the company will be allowed to commence construction of its Packing Plant and Stock Yards), then the actual location of its plant will be announced and full and complete plans will be published.

Construction Will Start as Quickly Thereafter as Possible.

ARE you going over the top with our *Fourteen Hundred* loyal stockholders? Included in this number are stockmen, fruit growers, farmers, bankers, business and professional men. They all agree that management and location are the prime factors necessary for the success of any institution.—**WE HAVE BOTH.**

DO you realize what this Five Million Dollar Plant means to the producers of live stock, fruits and vegetables of the Pacific Coast?

THE Virden Packing Company makes no promise of enormous dividends but calls your attention to figures taken from pages 3373 and 3374 of the Congressional Record of July 26, 1919, as follows:

One Thousand Dollars invested in
Armour & Co. five years ago is now
worth \$33,000.

One Thousand Dollars invested in
Swift & Co. six years ago is now
worth \$20,000.

One Thousand Dollars invested in
Morris & Co. three years ago is now
worth \$23,000.

One Thousand Dollars invested in
Cudahy & Co. six years ago is now
worth \$26,000.

One Thousand Dollars invested in
Wilson & Co. two years ago is now
worth \$7,000.

PROBABLE WHEAT SHORTAGE IN 1920.

The American wheat crop, including the United States and Canada, will be about 400,000,000 bushels less than was expected in the Spring, according to Julius H. Barnes, Director of the U. S. Grain Corporation. The shrinkage, amounting to about one-third of the crop, is due to weather and plant diseases. European production of wheat and rye will be short 300,000,000 bushels. Argentine wheat costs 50 cents a bushel more to deliver in Europe than ours. Russia, Rumania and India, formerly our greatest competitors in wheat, will have probably none to spare, though they ordinarily furnish Europe about 300,000,000 bushels a year. Australia's stored surplus is now being consumed. So, although the crop in the United States is 25 per cent above normal, there will still be a wheat shortage in 1920. (Manley Champlin, S. Dakota State College.)

Quest for Earlier Rice Varieties

(Written for Pacific Rural Press.)

This fall will have to be dry more than usually late or a great acreage of rice will be too immature to harvest. It was a continual wonder to the writer last May as he drove through the rice sections on both sides of the Sacramento Valley to see so many fields just then being checked when the rice should have been planted and up. It seemed like more than usual optimism was being shown by the growers. Many of them were still planting Wataribune May 15. The writer felt that one of the best known rice growers put it well when he said, "It costs a bunch of money to grow rice, and many a man has gone broke by taking unnecessary chances. I prefer to follow well-known successful measures with the main crop and do my experimenting in a small way on the side."

But many of the growers were taking long chances with late planting and relatively untried varieties. In at least one case the water supply proved disastrous by failing in mid-summer. There is always too much chance of wet weather at harvest under the best growing conditions we can hope for; and the planting should be done earlier than many did last spring in order to give a longer growing season.

Aside from preparation for planting, the time of getting it done, and the certainty of water, the question of varieties is probably most important. The proper variety may cover a multitude of omissions in culture.

Need Early Maturity with Good Yield.

The U. S. Rice Experiment Station at Biggs and a large number of progressive rice-growers have been trying out many varieties since the industry began in California a few years ago. Several of these varieties have been dragging along with about the same acreage year after year, but two or three have sprung into considerable favor. The chief object in trying out new varieties is to find one that matures earlier and yields and mills as well as the Wataribune, which is by long odds the standard here; but which matures so late that harvest and threshing are generally prolonged into the rainy season. That is awful in some districts. The adobe mud and the wet rice make a bad combination for the temper of harvesting crews, and wet rice is bad stuff to store after threshing. The matter of which variety to plant is an important one, but a variety that does well in one locality may be poor in another.

Characteristics of New Varieties.

One of the most popular new varieties is the "1600," one of those developed at the rice experiment station. It is a selection from a Japanese type, very similar to Wataribune, mills about the same, and heads about the same, but is two to three weeks earlier in maturing. It does not tiller so freely and makes shorter straw, but approximately the same yield of rice. Being less exuberant than Wataribune, it is better adapted to virgin land or on soil that is very rich where Wataribune makes too much straw and matures too slowly. Many people on both sides of the river planted this variety on half of their acreage, since it permits harvesting to begin sooner and helps avoid the rush. The rancher who puts a crew to work early stands a better chance to get the men and get his late crop in promptly.

Early Prolific proved early maturing in Louisiana, but it seems later in California. One season, when weather was hot at heading time it proved highly satisfactory in Butte county. Next year, however, with cool weather during the heading season, it took 30 days to get all plants headed out and it ripened unevenly. Since the Early Prolific grower must be a weather prophet, this variety is not generally planted, though fair success attended several years of commercial growing. It is a long-grained rice and does not yield as heavy as Wataribune, but the price is better. The straw stands up well. This variety is quite popular in Glenn county. Aikoku rice, after an eight years' struggle for popularity on the west

side sediment loams, is beginning to be recognized and the demand for seed last spring far exceeded the supply. Christensen & Burmeister of Glenn county had 110 acres of this last year, which yielded 60 sacks per

acre besides a lot lost in threshing. The quarter section on which this was grown cost \$10,000. The first crop on the 110 acres sold for about \$27,000, yielding the owners one-third as rent, or nearly the price of the entire 160

acres. Five thousand sacks were sold for milling, but would have been saved for seed if this spring's demand had been foreseen. These parties have 600 acres of Aikoku this season.

It ripens about three weeks earlier than Wataribune. The kernels are smaller and round, but it brought the top milling price. The straw is very tough and does not fall down. Its beards are red. The rice never shatters in harvesting, but can be threshed without loss if kept dry. Last fall the early rains caused five or ten per cent of it to run through the thresher. On the adobe lands of

the east side, this same variety has a reputation for lodging, low yield, weak straw and difficulty in threshing. Probably the contradictory difference is due to the different conditions. A carload was planted on 400 acres in Placer county this season, but water shortage has probably spoiled the crop.

The "1564" is another Experiment Station variety that has found favor on the east side, where it yields heavily and is earlier than Wataribune. It grows faster than most varieties during the first six weeks, and therefore gets ahead of the watergrass. The grain is hard to thresh out of the head, and some is lost through the thresher, but this variety has no loss from shattering. It mills exceptionally well and yields the highest percentage of head rice.

Edith is a long-grained rice, much desired by millers, but grown only to a limited extent in California on account of low yield and late maturity. It was introduced from Louisiana last year in a commercial way, though it has been on experiment two or three years. It yielded about 20 sacks per acre last year and the entire crop was sold for seed. An experienced grower recommends that not over 10 per cent of any man's crop should be of the Edith variety. Another experienced Butte county rice grower disclaims all sympathy with any long-grained rice so far introduced into California, and believes that early strains of Wataribune will prove most satisfactory to California pocketbooks. The west side acreage of this variety is about the same as last year.

Tokio rice is claimed by a big west side grower to be two weeks earlier than Wataribune and to have bigger kernels than Aikoku. He likes the variety and has sold some for seed to the east side. Several people around Willows have grown it three or four years, but the yield is not so satisfactory as other varieties.

Suehero is another that has lost favor on the west side, on account of weak straw and low yield. It matures about the same time as the "1600," but threshes hard and is not considered so good for milling.

One Glenn county grower is trying 200 acres of Onsen rice, which is said to have done well there last year.

Several other promising varieties are in the last stages of experimental study at the Experiment Station, and some of them will soon be on the market.

Many Varieties, Two Types.

H. O. Jacobsen, who spent four years with the Government in the Philippines, classified over 1,000 varieties and collected a total of about 2,500 different varieties.

It may thus be seen that each variety has probably been developed by picking the most satisfactory plants in each locality and adopting their seed by many generations of selection. Not a great deal of cross pollination can take place because the flowers are self-pollinated except in rare instances.

But there are two generally recognized classes, the Japanese or Oriental and the Honduras or Italian. The latter class is of the long-grained type, which must still be considered in the experimental stage in California. Wataribune is of the Oriental type, and is the best in general where it can be planted early.

Beans need to be cooked with lots of fat and then they make a complete ration that a man can work on and keep as strong as if he were beefing it three times a day. Beans are one dish that a man can relish every day in the week. Lots of fat, remember, or they are unappetizing.

Tomato growers at Martinez are having a hard time getting rid of their stuff, as they had expected the local cannery to operate this season and were disappointed. One man sent 50 boxes to a commission merchant in San Francisco for which he received a check for \$9.50.

Fourteen hundred vacant jobs are listed in Sacramento by the State Employment Bureau at present. There is a particularly strong demand for farm labor.

MALTHOID and RU-BER-OLD READY ROOFINGS

Here you see one of the shredding machines preparing rags for making into the tough, long-fibre felt which is the "base" or body of Malthoid and Ru-ber-oid Roofings.

Good ready roofing is simply a long layer of felt, saturated with a waterproof material and coated with a heavier weather-proof composition.

It can be seen then that the protection afforded by any roofing against sun and rain is in proportion to the quality of the materials that go into it. Thus the great importance of good, tough, long-fibre rag felt.

All the felt that goes into Malthoid and Ru-ber-oid Roofings is manufactured in our own mill. And because we are large consumers, we have the pick of the rag market. From this we carefully select the rags we need to make quality felt.

Malthoid and Ru-ber-oid are made to last. Starting with the felt, quality is built-in. Every step in the manufacture of Malthoid and Ru-ber-oid is carried on within our own mills and factories—under the care of experts—by means of the most modern machinery and facilities.

When you buy roofing buy the best—the safest protection you can get. It pays in fewer repairs and less cost per year of service. Malthoid and Ru-ber-oid Roofings have been making good for years, under all sorts of extreme conditions. Malthoid and Ru-ber-oid are sun, rain and fire-resistant.

Small Tractor Handles Big Cover Crop

(Written for Pacific Rural Press by John J. Fox.)

G. L. Savage of Sunnyvale has cut out the horse entirely and works his 30-acre orchard with a light wheel tractor. He has 20 acres of prunes running alternately four rows of Imperials and four rows of French and ten acres of peaches (Nichols, Runyon and Phillips Clings) interplanted with Wilson's Wonder Walnuts. This ranch was formerly owned by F. C. Wilson of Sunnyvale — the originator of the Wilson's Wonder Walnut.

With the tractor, Mr. Savage was able to turn under a very heavy cover crop last spring as late as the end of April, and then irrigated the whole place in May, using 2-12s, disk plow. The peaches received another irrigation the last of July and we saw no small peaches, though a little brown rot was evident. The use of one disk on the plow is enough to throw up checks for irrigation. The ground is in fine shape and the method of working it is worth recounting.

For cultivating, a six-foot double-disk is used, and it is followed, at a separate operation, with a home-made pointed-toothed harrow cultivator or heavy "drag" on a very heavy frame of 4x6 lumber. The teeth are set close and at an acute angle. They are $\frac{5}{8}$ inches square with about six inches exposed. A six-foot clod-masher of heavy logs finishes the operation and is very effective. The logs are as large as the old-fashioned hewn railroad tie and are firmly braced. Such a clodmasher would be a good load for four horses by the look of it. Mr. Savage said the work was no

trouble to the tractor. So late in the season it would have been a heart-breaker for a man and team. Both French and Robe trees are loaded with fruit and the foliage is a good color, though there is not much new wood, especially on the Imperial. The late plowing and the heavy crop would, however, account for this.

There are no props in the orchard, for the trees are wired. And there are no broken limbs. The cultivation with the tractor has been possible right up to the time the prunes began to fall. Mr. Savage will irrigate the whole place, lightly cultivate with his home-made cultivator and sow melilotus for a cover crop as soon as the fruit crop is off. He will thus have a good, firm seedbed beneath a light mulch, and should have a well-established cover crop before the cold weather sets in to check it. This will also enable him to plow earlier in the spring.

Tractor vs. Teams.

The problem of taking care of teams and over-Sunday chores is gradually

resolving itself by the use of tractors. We find also the small light truck up to 1500-pound capacity is being largely used in the orchard. It stands without hitching, is so much quicker, and is easier on fruit to be packed.

Does It Pay on a Small Farm?

Well, let us size it up. Mr. Savage has 30 acres of orchard. His tractor would take care of 60 acres and then some. But he would need four horses to do the work he has done with his little tractor, or else take an awful long time doing the work, thereby losing moisture and condition. A man has to have a pretty good team to take care of only 15 acres of real strong land, and then the team is idle two-thirds of the year and has to be cared for each day. And four real

This cut shows a wheel tractor cultivating a walnut orchard with a double disk and doing good work.

is the descendant of the pioneers of the industry. There has been plenty of time to improve—to correct early weaknesses. And that is why thousands of Huber owners everywhere say the Huber is the tractor that "always keeps going".

The direct spur-gear drive of the Huber by which the transmission system is reduced to the greatest simplicity is a big factor in Huber dependability. There are no bevel gears—nothing but a clutch and spur-gear reduction. Huber high wheels roll easier and afford "more traction grip"; center draft conserves power by avoiding side pull; extra strong materials reduce weight. An exceptionally large portion of the power of the motor is delivered to the draw-bar.

good horses and gear cost as much to buy as a small tractor while the machine does the work in half the time and doesn't need to rest every round on a hot day.

The quality of the work as well as the time expended must be noted, and you can't work that out by keeping tab on the money spent—not by dollars. The time has come in some sections where it is easier to find a good machine man than it is to find a really first-class teamster. A good man can drive very close to the trees without injury. For the tractor doesn't weave out of line like a four-horse team does. It goes where it is steered on the level and eats nothing when it is idle. But every owner should take the time to make himself thoroughly familiar with its requirements and then faithfully carry them out. To halt for any small adjustment and send to the shop for a trained man won't do—even a cracked plug porcelain has sometimes been responsible for this. We have to locate any little trouble (should it occur), correct it and drive on. If Bill can do it, Sam can learn to in short order.

TRACTOR IMPLEMENT EXHIBITS.

The tractor tents at the State Fair contained a great deal besides tractors. The man who wanted to learn all the fine points about plows had at least a full day's work in store. It was more than the writer could undertake this time, except to chronicle the number of makes in another article. There was every shape of mold board from the augers built to lay any sod strictly upside down to the big gangs built to plow the hardest soil a foot deep. Disk plows of several sizes and in multiple gangs introduced some new features of attachment and adjustment. Disk cultivators, single, double, automatic, and power-lift, were next most prominent. Killefer deep tillage cultivators, chisels, and subsoilers illustrated the whole gamut of subsoil farming. Land levelers occupied a prominence never before attained.

The Schmeiser Manufacturing Company and Holt Manufacturing Company, who always exhibit their standard giant levelers, had some of them at the State Fair. Three new land levelers appeared this year. The Sandstrom leveler for operation by the driver of a small tractor was a great attraction. The blade of this machine is raised and lowered between sled runners by means of a counterbalanced lever. A cable from the upper end of the lever is wound up on a windlass beside the tractor driver's seat at will to work the lever.

The Purviance levelers, also built to be manipulated by the drivers of small tractors, were there for examination. These were described in a recent issue.

The San Jose scraper built for two horses found its way into the tractor tent. A five-foot blade with forward-reaching wings hangs from a platform which is balanced on two wheels. Ingenious but simple levers worked by foot through the platform, lock the leveler blade at any height. It is raised and lowered by the operator stepping back or forward on the platform whenever it is not locked by the foot ratchet.

The G. M. C. factory recently ordered 180,000 tons of steel, all to be delivered at their Janesville, Wis., factory. This will be used in automobiles, motor trucks, and Samson tractors. Their Sieve-grip tractors are all made in the East now for economy's sake, but are assembled in California, also for economy's sake.

It cost F. C. Critchett of San Joaquin county 41 cents per acre besides labor to plow 300 acres using an 18-36 tractor plowing 96 inches and using distillate, which cost 12½ cents per gallon. The 41 cents included oil, plow sharpening, repairs, etc.

The New York Belting Company notified its San Francisco office August 25 of a ten per cent advance on Test Special belting, the advance to take effect immediately.

Fairbanks-Morse
"Z" Engine with
Bosch Magneto

SINCE the "Z" was put on the market, over 250,000 farmer buyers have pronounced it the greatest farm engine value. ¶ We felt the same way about it. ¶ But following our policy to improve our product whenever possible, we are highly pleased to announce a new Fairbanks-Morse "Z" with Bosch Magneto—high tension ignition which adds the one possible betterment. ¶ Call on the "Z" dealer near you—see this world's greatest engine—understand the full

meaning for you of the engine service which over 200 Bosch Service Stations give, in co-operation with every "Z" dealer, to every "Z" engine buyer. ¶ Prices—1½ H. P. \$75.00—3 H. P. \$125.00—6 H. P. \$200.00—All F.O.B. Factory.

Fairbanks, Morse & Co.

MANUFACTURERS CHICAGO

Who Does Your Pumping?

If it is a windmill, what do you do when there is no wind?
If your hired man, what do you do when he is sick?
If yourself, what do you do when you have to make a trip to town?
Your thirsty cattle must have water just the same.

The FULLER & JOHNSON Farm Pump Engine

answers the question correctly. It will pump the water any time, all the time. It doesn't need wind, it doesn't get sick. It doesn't have to wait until you return. It is always on the job. It is so simple anyone can run it and is perfectly safe to handle.

Comes to you ready to run, no brakes, belts, or platforms needed. Don't wait until something happens. Get one NOW. The price is very low and it costs very little to run one. Write today for free descriptive booklet and name of nearest dealer. Address your letter to Department A, PACIFIC PUMP AND SUPPLY CO., 551-853 Folsom St., San Francisco

NEW HARNESS

is cheaper than second-hand, dollar for dollar of cost. Come in and see what we have to offer you in HERCULES HARNESS, Saddles, and Horse Collars. Our own make and fully guaranteed.

Reflections--"After the Battle"

(Written for Pacific Rural Press.)

Holsteins-Friesians.

Sometimes when a prize is offered for competition there is a qualification attached saying that it shall be won three times in succession before the prize becomes the actual property of the winning contestant, and when so won becomes indeed a guerdon of high honor. Of course, winning the grand championship the third time in succession at the State Fair this year with their wonderful show and breeding bull, King Segis Alcartra Prilly, the Bridgford Holstein Co. of Patterson does not have any mortgage on that prize in the future, but it is certainly a very high honor, especially when won in a class with such strong competition.

The honor, however, is not altogether in this bull simply winning in his class, but his get won almost all the way down the line. His daughter, Empress Pontiac Prilly, was junior champion heifer and grand champion female; his get, first in calf herd, first in breeder's young herd; in the senior heifer class first and second, and same in junior heifer class; first senior and junior yearling heifers; second, third, fourth and fifth places in senior bull calf class, only losing first place in this class to that great youngster, Sir Aaggie Korndyke Mead, bred by the A. W. Morris & Sons Corporation and owned by Dolcini of Davis.

The showing made by the other great herds of California was only slightly less in merit, as the W. J. Higdon herd of Tulare, the Henderson Co. of Sacramento, the J. S. Gibson Co. of Williams, and H. E. Cornwell of Modesto were right along a close second where they were not winners. Surely a great Holstein show probably not excelled anywhere.

Ayrshires.

The Ayrshires were a goodly lot of Scotch "coos," both to look at and in performance. Wonderful in quality and substance, the herd of J. Henry Meyer of San Francisco had the best of it, but was closely followed throughout by the McFarland herd and Preston School of Industry.

Jerseys.

The beautiful Jersey was exceptionally well represented, both in quality and numbers to Holsteins. J. E. Thorpe of Lockeford and Dr. H. W. Hand of Orland carried off the largest number of prizes, although Guy Miller of Modesto and S. F. Williams of Chico were close in the running all the time. Sunshine Farm of Modesto also made a very creditable showing. Last but not least is the showing made by M. Fortini of Orland with the senior heifer calf, Jewel of Trintagel, winning first in class and made junior champion. Mr. Fortini only showed the one animal but certainly made a great "killing" for the number shown.

Guernseys.

Honors in the Guernsey classes were divided principally between A. B. Humphreys of Escalon and Elliott-Brant Rancho of Owensmouth, although L. D. Smith of Berkeley had a good herd on exhibition and won in

some classes. The railroad strike in southern California prevented one great herd from showing in this department.

Shorthorns.

The "reds, whites and roans" were surely in evidence as far as quality was concerned, although in numbers they were lacking. The herds of San Julian Rancho, Hillcrest Stock Farm and Pacheco Cattle Co., carried off the most of the honors, although Wm. Bond of Newark had a very good herd on exhibition.

The grand champion bull, Basham Augusta, owned by Thos. B. Dibblee Estate, was somewhat deeper and better filled in the front than his closest competitor, Pacheco Marshall. The aged bull, Hallwood Flash, owned by the Dibblee Estate, is a great bull, but was alone in his class. Wm. Bond had a good youngster in the junior yearling bull that may be heard from later.

In the females, T. S. Glide's Little Sweetheart was first in class and grand champion. She is a wonderfully thick, straight, deep animal, with a very typical Shorthorn head and about the only fault she has is a slight gauness about the tailhead.

Herefords.

Again we have to fault the numbers rather than the quality. Bunting's Mission Chief, a junior bull calf, was first in class and grand champion bull of the breed. A very straight, typey youngster that surely ought to be heard from in the future. Barn-grover's Patrician 5th was first in aged bulls, but had no competitor.

Alamo Reuben, shown by Riverside Hereford Ranch of Nevada, was first in two-year-old bull class, winning over G. W. Emmons' two entries with more scale and substance.

The females were headed by the polled cow, Pearl, shown by J. D. Brunton of Aspen, Col., who was first in the aged cow class and made grand champion. She is a very stylish, straight animal and worthy of the place she won.

The Dairy Shorthorns.

Very few, if any, fairs or livestock shows of the country will have as good an exhibit of this great class of dual-purpose cattle. Two of the greatest herds on the Pacific Coast and two smaller ones were represented. Foothills Pioneer, owned by Thos. Harrison, was grand champion bull, although he had strong competition. Harrison also had junior champion bull in a very classy youngster, Count Tickford. Harrison won in the male line, but Alexander & Kellogg had a great showing in the aged cows, winning grand champion cow with Lady Beatrice and first in the herds, but Harrison winning firsts in heifer and calf classes with a beautiful lot of heifers. Glen Dorothy, a senior yearling heifer, will be heard from both in the showing and at the fall in the future.

YOUNG SERVICE BULL FOR SALE

Prince Abbecker Aralla Walker, No. 204267—Three-quarters white. Write for pedigree and price. Inspection invited and satisfaction guaranteed

this great breed? The judge, Wyman N. Lovejoy, said they were better as a whole than the showing at Illinois. Sandercock won grand champion boar with Natomas Baron Duke, a son of Baron Duke 201st, a great son of his father, smooth, long and thick, with a strong back and standing fine on his feet. A. B. Humphrey won grand champion sow and champion barrow. Muddox & Son won first in the aged boar class on Rincon Leader, an excellent type and well worthy of the prize.

Western Berkshire Congress prizes for new exhibitors winning the greatest amounts went first, to Muddox & Son; second, to J. A. Parker; third, Italian Vineyard Co.; fourth, S. A. Brittain; fifth, Fair Oaks Ranch.

Duroc-Jerseys.

Strong in numbers as well as quality, the big type hog was much in evidence. Exhibitors from all parts of the state defying all difficulties, made the greatest show of the breed this state has ever staged. Aged sow and junior yearling classes were very hotly contested, and Judge Putnam surely had his work cut out for him, but he placed them to the general satisfaction. The differences were so slight that it was no disgrace to be placed down in the line. Model Defender Lady was first in class and grand champion sow of the breed. Truly a wonderful backed sow, with good feet and lots of quality. Sensation Wonder 1st, shown by Slocum & Son, was the grand champion of the show and is a grand example of the big-type hog. Slocum also had junior champion boar in Uneeda Invincible Col. The Diamond Bar Ranch had a boar of great bone and substance in Mammoth Sensation 2nd that was first in class, and they also won in three of the young sow classes. J. E. Thorpe of Lockeford had an exhibit of greater worth than many, in that it was all of his own breeding. His boar, Freddy You'll Do, is a good one, although placed fourth in his class. H. M. Berglund, Witherow & Stafford, Jack Borge, W. J. Fulgham & Sons and others, all were there with good ones and won their share of the ribbons.

Poland-Chinas.

"Many are called and but few are chosen." Numbers, yes, and quality of the highest. Perhaps not all of them of the extreme type, although that was the type with which Judge Shattuck started and to which he consistently adhered throughout. In the boars, Chas. Gatewood of Fresno won the grand championship with the junior yearling, Giant Bob, a very strong, smooth, upstanding fellow of great size for his age and a promise almost sure of filletment that he will grow into one of the largest boars in the United States. McCarty & Starkweather won grand championship on sows with Big Model Mary 3rd, a very deep, smooth, upstanding sow that is about as near what the fashionable breeders are looking for as one could wish. J. E. Lehman won more prizes than any other one breeder, including the beautiful silver loving cup given for the best futurity litter. W. A. Young was in the running all the time and had many prizes to his credit when the show was over. M. Bassett & Son were there with a lot of good ones and had the grand champion barrow over all breeds, as well as first prize pen of three barrows. Many other breeders were there and won their share of the prizes and helped make the largest and best Poland-China show ever held at a California State Fair.

Chester Whites.

The number of herds was greater than at previous fairs, with quite a number of new breeders showing. C. B. Cunningham of Mills had rather the best of it in the number of prizes won. He received both grand championships and firsts on herds, get of sire, and produce of dam, with nearly all firsts in classes. Mrs. L. M. Yore had a great exhibit, but did not have quite the quality and type of Mr. Cunningham's herd.

Altogether the swine show was a great one and one that will be hard to excel from point of quality, although from the way California is taking to swine we may expect a larger one next year.

Along the Livestock Trail

(Written for Pacific Rural Press.)

Happenings at Hillcrest Farm.

On a recent visit to Hillcrest Farm, Davis, some of the men happened to be hauling wheat straw from the fields and running it through a feed-cutter with blower attached. One lone man had arrived with a load some distance ahead of the rest, and instead of waiting for more help he immediately started the electric motor by which the feed cutter was operated and proceeded to "cut" his load alone, and store it with the assistance of the blower in the far end of a barn 108 feet long. "The world certainly do move" in agricultural and livestock circles, as well as elsewhere, as forty years ago it would have taken at least 5 men to accomplish what one was doing alone. Another man usually "fed" the cutter, as it would expedite operations somewhat, although one man alone was doing very well.

This visit mentioned above was not for the purpose of getting notes on mechanical devices for expediting farm labor, but rather to inspect some of the Shorthorns that are always found at their best at this place. While it is possible to apply labor-saving machinery to preparing bedding (for which the straw was being cut), grinding feed and cutting ensilage, it is not possible to prepare feed and fit the "reds, whites and roans" in any except the methods that have been employed for years and for which only the few, of whom Wm. Robertson, herdsman for Mr. Glide, is surely one, are really fitted.

Mr. Glide's Shorthorns certainly have been coming along in great shape and show emphatically the results of excellent care and fitting that no machinery could ever be made to do. Nothing but the watchful eye and careful hand can ever produce the results attained in Spicy Lady and Little Sweetheart and many others. They certainly ought to give a good account of themselves in the show ring this fall.

Greenwood Farm Durocs.

Witherow and Stafford of Live Oak certainly have a great start in Duroc-Jersey swine breeding and when they get in full swing with all the Durocs that 80 acres of alfalfa and 160 acres of barley will carry they certainly will have "some hog ranch." If they continue with as good stock as they have started, and they will, again we will say, "Some ranch!" Johnson's Defender, Jr., their senior herd boar, is a very promising boar, both as an individual and as a breeder. His pigs are a very uniform, smooth lot, with plenty of stretch and quality.

Herefords at the Diamond G Ranch.

This article will seemingly deal more directly with grades of Hereford breeding than with the purebred ani-

mals. It must not be inferred from this that Mr. Gable, owner of the Diamond G, has nothing but grades, as he has one of the most noted herds of that famous breed in California. It will show, however, that great skill and judgment have been displayed in the management of his herd on the range.

Fifteen years ago Mr. Gable purchased a bunch of three-quarter bred Hereford cows and heifers, and placed them on his range in the Western part of Yolo county. Since that time he has used purebred sires continuously, sparing no pains to procure such bulls as he thought would improve his herd most rapidly. He was also careful not to overstock his range so that plenty of feed would always be in evidence not only to the eye, but in the condition of the cattle. Not only was Mr. Gable careful about the range feed, but plenty of water, pure and clean, was furnished first from springs, but when that became inadequate by power pump. In this way the cows nourished the embryo calves properly, furnished plenty of milk for the youngsters after they were born, and there was sure to be plenty of grass after they were weaned to continue their growth.

It is a common thing among good sheep and hog men to provide "creeps" for the lambs and pigs so they may have access to grain feed at all times to supplement the dam's milk, but Mr. Gable arranged a water trough so that the calves had access to pure, clean drinking water, undisturbed by the older cattle. We all know the "dog in the manger" attitude of the larger, stronger, more aggressive cattle toward the younger and weaker, causing actual suffering at times if some such provision is not made.

The results obtained by the above-mentioned careful supervision and management, combined with the use of first-class purebred sires, certainly are an object lesson well worth the inspection of those who are doubtful as to the value of such methods. This range herd is to all intents, and for all feeding and market purposes seemingly the equal of a purebred herd. The cattle have size, uniformity, both in conformation and color and the quality and disposition that makes for economical feeding. Fifty cows could be selected from this grade herd that would pass inspection as purebreds anywhere. Does any one think that Mr. Gable could be convinced that he could have accomplished like results or "made as much money" by using scrub bulls? Or is there any one who would have the temerity to suggest to him that he had better turn in some scrub bulls with these cows now?

The San Francisco Livestock Show

(Written for Pacific Rural Press.)

Entries are beginning to arrive at headquarters for the California International Livestock Show for the big exposition of purebred livestock to be held in the California Building at the Panama-Pacific grounds, San Francisco, November 1 to 8. Manager Gordon H. True says that strong competition will be the rule in every class as the State Fair and a number of county fairs will serve the purpose of eliminating some of the plainer animals and leave only the best for the San Francisco show.

It has been the custom in the Middle West that the early shows, while strong in numbers, are sometimes lacking in quality, whereas the later shows are confined to the prize-winners of the earlier fairs. This will be the first time that California has had such a stock and poultry show, because many exhibitors heretofore have been satisfied to make their only display at the State Fair and rest upon the honors won by one showing.

Coming at a time of the year particularly desirable for beef cattle men,

the honors won by one showing. the classes in this section will be much stronger than at any other exhibition of livestock in the State. Dairy cattle classes have been given the same treatment as beef cattle in the apportionment of premiums as every class of farm animal is sought to make this a complete livestock show. Swine exhibitors will also find that they have been liberally taken care of in the premium list, as have the sheep, poultry and rabbit exhibitors.

Work has been started on the arena built inside of the California Building in which will be held a nightly horse show and the livestock parades. Four inches of tan bark on a layer of clay will furnish the foundation for the ring.

The Senior Boar Pig and Junior Champion at the Iowa State Fair was Ames Rival 199th, a son of Mayfield Champion, who was bred by Wm. Carruthers and bought by Dean C. F. Curtiss at Carruthers Farms' auction sale two years ago.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

It keeps the grain in the trough

Calco Automatic Grain Feeders save grain—and money. When the hog roots, the grain remains in the trough.

Inside the Feeder is a cone, regulated to feed automatically, any desired amount of grain into the Feeding trough.

Built of rust-resisting "Armco" and cast iron, these automatic feeders are strong, durable, and lasting.

Cut the cost of feeding your hogs—install Calco Automatic Feeders.

Seven sizes, capacities from 2½ to 14¼ bushels, priced right.

Send for folder and prices.

VALLEY VIEW FARMS DUROC-JERSEYS

One of Glenn County's Foremost Herds.

Herd headed by Uneeda Sensational Defender, sired by Sensational Defender. Seven times Grand Champion. He is a line-bred, big-type boar of huge bone and extreme size, imported direct from McKee Brothers' herd in Kentucky. Mr. Bear-buyer, get your boar now. Boars will be at a premium this fall. Boars for the farmer, feeder and breeder at reasonable prices. Breeding stock and open gilts for sale at all times.

W. T. HOLLINGSHEAD & SONS

BOX 505,

ORLAND, CAL.

Johnson's Defender Jr.

owned by

GREENWOOD FARM

LIVE OAK, CAL.

is California's greatest representative of Defenders, the greatest Duroc family. At the State Fair he was the smoothest boar shown, weighing 700 pounds at 17 months and carrying it on a perfect set of feet and legs. He won second in the strongest class of boars ever shown on the Coast and was a popular favorite. Three of his brothers won ribbons in the same class, showing the strength of this line of breeding.

FIVE RIBBONS WON ON FIVE ENTRIES.

November 17-22—Pacific International Livestock Exposition, Portland.

The Dairy.

Officers of the California Jersey Cattle Breeders' Association for the ensuing years are: J. E. Thorpe, Lockeford, president; J. E. Wherrell, Riverside, vice-president; Prof. V. C. Bryant, Berkeley, secretary; N. H. Locke, Lockeford, treasurer; Guy H. Miller, Modesto, Dr. H. W. Hand, Orland, Mrs. Hardie and C. G. Marrin, Escondido, directors.

The members of the Ferndale Jersey Breeders' Association are intending to make a large exhibit at the Northern Humboldt Fair at Arcata, September 25-27. They expect to exhibit enough cattle to fill two cars and have spoken for 25 stalls for them. These breeders say that if Arcata is public-spirited enough to hold a fair, they should be supported and they intend to help them all they can.

FINANCIAL WONDER PACIFIC HERD OF POLAND-CHINAS

Prolificacy, quick maturity and easy-feeding qualities.

MRS. NETTIE E. ANDREWS,
Modesto, Calif.

Ranch 2 miles east on Dry Creek Rd.

The big merger of co-operative creameries in and about Fresno is practically complete, according to a statement issued by Fred W. Hansen, president of the San Joaquin County Milk Producers' Association. The value of the twelve plants included is approximately \$690,000, and the final result will be a great saving to the producer by concentration of labor and elimination of duplication of milk route hauling and other labor.

Swine.

The Western Berkshire Congress will hold a bred sow sale on Wednesday, October 22, at the Los Angeles Live Stock Show. The offerings are to be of the highest quality and will give the stockmen of Southern California an excellent opportunity to procure some of the best Berkshires in the United States.

H. P. Slocum & Son, while at the State Fair, sold three junior yearling sows for \$2,000 to Witherow & Stafford of Live Oak and H. S. White of Chino. Two of these sows were granddaughters of King's Col. and out of a Golden Model dam. The other was sired by High Orion and out of Modelepa, the \$1,000 sow.

Tulare Market hog auction sales fell off last week from \$2.60 for the tops and \$3.60 for inferior grades. This drop is said to be due to the investigations by the government into the H. C. L. The top prices at the last sale and also at the one a month ago were brought by hogs averaging around 225 pounds.

Harvey M. Berglund sold a service boar out of his herd of Duroc-Jerseys to Dr. O. A. Hoffman of Walnut Grove. This young boar was sired by California Orion King, the boar that was second in class this year to the Grand Champion. Also the boar that defeated California O. K. last year was made Grand Champion then, but was in turn defeated by California O. K. this year in class. This gives Mr. Berglund's boar a very high rating and he may well feel proud of him.

The annual meeting of the California Duroc-Jersey Association was held on Monday evening, September 1st, at the Travelers' Hotel, commencing with an elaborate banquet. After the banquet Pres. Johnson called the members to order for the transaction of the regular business. Election of officers for the ensuing year resulted in the unanimous choice of R. K. Walker of the Winsor Ranch, Bonita, as President; Dolcini, Davis, Vice-President; S. E. Whiting, Sacramento, Secretary-Treasurer, and R. E. Braley, H. C. Witherow, Donald Graham and Harvey M. Berglund, Directors. A fund of approximately \$1,200 was raised in a few minutes by subscription for publicity and breed promotion. It was also decided to hold a January bred gilt and sow sale at Davis, the exact date of which will be announced later.

Sheep.

D. E. Kelliher of Eugene writes that he recently brought out from the East a carload of Hampshire sheep. Included were fine selections from the English flocks of Judd Ismay and Williams, selected for him by Robert S. Blastock, together with selections from the Butterfield, Detweiler, Howland and other leading American flocks. In the same shipment were 12 yearling ewes, sired by the \$1,600 Detweiler ram purchased at the Salt Lake Sale in 1917. A finer bunch of Hampshires never came over the Sierras, it is said.

Any one at all familiar with Merino sheep of the "large type," if we may borrow a term from our friends, the swine breeders, cannot help but be favorably impressed with the Rambouillet-Merino, or Bullard Merino, bred and exhibited by the Bullard Bros. of Woodland. These sheep are very large, blocky mutton type of Merino, with exceptionally long, fine wool of strong stylish fibre. They are really a breed by themselves and should be bred as such. The foundation of the flock was the American Merino brought from Vermont almost

PRINCE ALBERT

Copyright 1919 by
R. J. Reynolds Tob. Co.

Toppy red bags, tidy red tins, handsome pound and half-pound tin humidors—and that classy, practical pound crystal glass humidior with sponge moistener top that keeps the tobacco in such perfect condition.

PLAY the smokegame with Prince Albert if you're hunting for tobacco that will cheer your smoke-appetite! For, with Prince Albert, you've got a new idea on the pipe question that frees you from stung tongue and dry throat worries! Made by our exclusive patented process, Prince Albert is free from bite and parch and hands you about the biggest lot of smokefun that ever was!

Prince Albert is a pippin of a pipe tobacco; rolled into a cigarette it beats the band! And, what you're going to find out pretty quick thousands of men discovered as long as ten years ago when P. A. started a smoke revolution!

Get the idea that P. A. is simply everything that any man ever longed for in tobacco! You never will be willing to figure up the pleasure you've missed once you get that Prince Albert quality flavor and quality satisfaction! You'll talk kind words every time you fire up!

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

half a century ago by the father of the Bullard Bros., who continued to breed for a large smooth-bodied sheep with a very fine, stylish fleece. Twenty years ago crossing with the Rambouillet was commenced, resulting in the present really wonderful type of sheep. More about this great flock will be written in the future.

Cream and Milk Protection in Transport

(Written for Pacific Rural Press.)

The transportation of milk and especially cream for long distances is a necessary condition imposed upon dairymen in most parts of California. For a large part of the year, temperature conditions are unfavorable and some means of protection from the sun and heat is absolutely necessary.

While doing inspection work in Mendocino county this summer, I had ample opportunities to observe transportation methods, as there is quite a quantity of cream shipped to creameries at Petaluma and San Francisco. On many occasions, I have seen cream in 5 and 10-gallon cans setting out in the sun for an hour or more awaiting the arrival of the train, temperatures ranging during this time of day from 90 to 105 degrees. On arrival of the train, which is often late, the cans of cream are put into stuffy baggage cars, where the temperature is nearly always high. Cream may be delivered sweet at the express office and turn sour in less than one hour under these conditions. Imagine the shape of this cream when it arrives at Petaluma and San Francisco, after traveling from 4 to 7 hours on hot days.

Cream of this type is not fit to use in making butter, and quite often the

dairymen suffers a cut in the price of his butterfat, due to the conditions I have mentioned above. It is outrageous to allow transportation companies to handle milk and cream in this manner. There is no food product that I know of that decreases in quality so rapidly in hot weather as milk and cream and is handled so careless in its transportation.

Milk and cream should always be kept at a temperature of not over 50 degrees F. to insure it remaining sweet. This is a reasonable and necessary requirement, but is difficult to maintain unless transportation companies are required to keep milk and cream below 50 degrees F. while in their care, if it is received in that condition. To do this the companies should provide proper shelter for milk and cream on their trucks, platforms, and refrigeration during transit. They should make an effort to deliver milk and cream at its destination within a reasonable time.

Our legislature should pass adequate laws which would insure this protection to the producer, creamerymen, distributor, and consumer by assigning proper penalties for failure to meet these demands.

Result of State Butterfat Contest

(Written for Pacific Rural Press.)

The results of the three days' butterfat production contest of the State Fair, September 4 to 6, 1919, under the personal supervision of F. W. Woll, Professor of Animal Nutrition, University Farm, Davis, are given below. Such a contest, while not ex-

tending over a period long enough to show the real ability of an animal in the production line, still gives quite definite information. It is contests along these lines that are really worth while, and it would seem best that they be continued.

LIVESTOCK SHOWS AND LAND VALUES.

Mr. Hugh G. Van Pelt, Jersey and Holstein-Friesian judge at the State Fair, gave in one of his speeches before the dairymen of the State during Fair week, a concrete example of the benefits any district or State obtains from having a stock or dairy show such as California is to have in San Francisco in October.

Several years ago Waterloo, Iowa, was the site of a district dairy show. Soon after this show had disbanded some local bankers went to New York in person to dispose of some Waterloo farm mortgages, which had been worrying them for a long while. To their surprise these mortgages were snapped up. Mr. Van Pelt heard of this rather unusual thing and upon inquiring, he was informed by the

Wall street bankers who purchased the mortgages that they had known of this dairy show and considered it to be the best indication as to the fertility and industry of the community. Therefore, the Iowa farm loan values for 100 miles around Waterloo jumped \$50 per acre on Wall street.

The Pacific International Live Stock Show at San Francisco will not only increase loan values for all of California, but will increase land values. The advertising this show will give on Wall street will aid us all in the future, just as it has at Waterloo.

Also, the local capital will act toward communities where the prize winners and outstanding exhibits hale from, just as Wall street will act toward all of California.

Poultry and Rabbits for Profit

FUR-BEARING RABBITS TO SHOW.

The California Rabbit Breeders' Association has announced California will soon rival Australia, Great Britain and Ireland, the great rabbit-producing countries of the world.

The modest rabbit has come into its own as a fur-bearer. The desirability of its meat has long been known to the gourmand. It is more delicate than chicken and enjoys an unusual flavor. But it is the fur-bearing bunny that California breeders are largely interested in.

The rabbit today parades under many furry disguises. Those who know, according to Mrs. Leroy Hackett, president of the California Association, declare that the costly mole, some grades of so-called foxes, chinchilla, ermine, electric seal, Baltic seal and other pretentious coats found their origin in the humble pelt of the bunny.

"The wild fur-bearing animals are decreasing," declares the president, Mrs. Hackett, and the demand for furs is becoming greater, the natural supply is becoming smaller. This condition must be met."

As for the rabbit, California produces the finest fur-bearing rabbits in the world. Texas is a close second; Utah and Oklahoma are great producing States. But conditions in this State are ideal. The rabbit thrives in all season out-of-door life and upon alfalfa hay and barley. All of these may be had in California 365 days in the year.

One hundred fur-bearing rabbits, for which California is becoming famous, are to be exhibited by the California Rabbit Breeders' Association at the California Industries and Land Show, to be held October 4 to 19 at the Exposition Auditorium, under the auspices of the Home Industry League of California.

LICE ON CHICKENS.

To the Editor: Please tell me the best method to get rid of lice on chickens about three months old; also hens? We have been told to give them a bath in sheep dip solution, but others tell us that if we have it strong enough to kill the lice it will injure or kill the chickens. We have been farming one year and your valuable paper had been a great help to us in many ways.—Mrs. B. J. Porterville.

The quickest way to rid chicks and fowls of the large body lice is to dust each one with insect powder, and repeat in about one week. If the young and old fowls are supplied with an earth-bath they will rid themselves of most of the body lice. Dry dust will answer the purpose, but fine loam is better for the reason that fine dry dust sometimes carries disease germs into the throat or lungs and it is not so soothing for the fowls as the moist loam. The loam should be kept moist but not very wet—just as it should be for planting seeds. All fowls, including chicks, thrive better if they have constant access to an earth-bath. To quickly destroy and prevent perch lice, or night mites, thoroughly spray every part, including ceiling and floor, of the sleeping quarters with stove distillate, in which is mixed about ten per cent of liquid lice killer, crude carbolic acid, or something similar. This stove distillate is the cheap kind used for burning, with patent burner, in kitchen stoves, and is obtainable almost everywhere. It is also known as medium or blue distillate to distinguish it from the crude and the engine distillate.

PULLETS ACT WOBBLY.

To the Editor: What ails my pullets? I have lost some. They throw their heads back and act wobbly. Then then sit down or fall backward and their combs pale. They die in two or three days. I give them commercial scratch feed in the evening, and sprouted barley and oats in the

forenoon; also give greens and keep dry mash before them all the time. They have no chance to get any refuse. Would like to know what to do.—A. L., Soquel.

These fowls act as though they had eaten deadly nightshade (*Atropa belladonna*), which may have been given them with the greens. This plant thrives in shady creek beds and sheltered portions of wood lands and thickets. It is a small plant with reddish bell-shaped flowers that somewhat resemble the bloom of potato vines, to which plant it is related, and yields shining black berries. The drug, belladonna, is made from the leaves and roots—the whole plant is poisonous. For a remedy, make an infusion or tea of galls in which, while lukewarm, dip the fowls head several times and allow it to swallow some of the tea. Use care to avoid strangulation. After drying the fowl's head swab its throat with one drop of tincture of iodine. A swab may be made by twisting a small portion

of cotton on the end of a toothpick. The galls of any animals may be used and these are usually obtainable at retail butchers.

REFRIGERATING PLANTS FOR EGGS AND POULTRY.

American farmers and poultry raisers are losing an average of \$200,000,000 yearly because of improper methods in handling at the point of production, Dr. Mary E. Pennington, who is in charge of poultry and egg investigations for the Department of Agriculture, told the House Agriculture Committee recently. Dr. Pennington was asked by the committee to give her views on proposed regulation of cold storage plants and her statement relative to losses by the farmers was made in that connection.

"Better handling of eggs and poultry at the point of production will eliminate great losses all along the line," Dr. Pennington said. "I think the industry aggregates a production of about \$1,000,000,000 per year, but it is not all realized. The farmer must hold his stock under refrigeration if he is going to get a stock of any magnitude. The refrigeration is

the thing that is lacking. It has been developed greatly in the last few years, but greater strides should and are coming.

Dr. Pennington made a strong plea for the use of refrigerating plants wherever such were available. She declared that eggs could be kept in storage for twelve months without deterioration or loss and that the same time limits applied to poultry.

PROBABLY RHEUMATISM.

To the Editor: Some of my hens are getting lame and die after a couple of weeks' illness. Is there any cure?—J. L., Salinas.

It is impossible to determine the exact nature of the trouble from the above imperfect description of symptoms, but, assuming that our correspondent would have mentioned any

Make your hens moult quickly

Get more winter eggs

The moult is a severe test of a hens strength. It calls on her to supply all her surplus energy and flesh to make feathers. Hens must have a tonic during this critical period, to supply them with more energy, and help them to digest and use every ounce of the feed. Make your hens moult properly this year, by giving them

Dr. LeGear's Poultry Prescription (Powder)

in their feed. This prescription, compounded from my 27 years veterinary and poultry raising practice, absolutely cuts down the time and strain required for moulting, keeps hens in strong, vigorous condition and insures your getting more winter eggs from your hens. Don't lose profits from high winter egg prices by neglecting your hens during the moult. Try this famous remedy, recommended by thousands. I guarantee that it will help make your hens lay more eggs.

Dr. LeGear's Stock Powders.
produce perfect digestion, drive out worms, increase growth and production.

Dr. LeGear's Antiseptic Healing Powder.
cleanses, dries and heals sores and cuts quickly, handy to use, in sifter top cans.

Dr. LeGear's Lice Killer (powder) kills your flock quickly of lice, protects chicks, etc.

Money Refunded

through my dealer, if any remedy bearing my name fails to do what I claim for it. Ask your dealer for a package today. Sold by 40,000 dealers—never by peddlers.

"PROTEIN FOR PROFIT."

outward indication of injury, we suggest that it may be a form of rheumatism which, at times, attacks flocks of fowls that are fed an abundance of rich feed and are supplied with little or no greens or fresh vegetables. Often this form of rheumatism is complicated by a formation of liquid in the sack covering the heart and sometimes, in such cases, the fowls die suddenly and without any apparent cause. As a remedy, give an abundance of greens and vegetables and in as large a variety as possible; temporarily reduce the heavier and rich feeds, and give in each quart of the drinking water fifteen grains of iodide of potassium.

RHODE ISLAND REDS EARLY LAYERS.

To the Editor: At what age do Rhode Island Red usually lay? I had one that began laying at four months and six days and one at four months and seven days. Are these record breakers?—V. M., Del Rey, Cal.

Rhode Island Red pullets frequently begin laying when between four and five months of age. However, in order to allow the pullets to gain a maximum of vigor and attain large size, and to avoid quite a long period, during which small eggs are produced, it is preferable for them to begin laying when they are about six months old. As a means of postponing egg production, the pullets should have a large proportion of bulky feeds and a lesser amount of concentrated stuff; avoid feeding large portions of finely ground rich meals and meat until it is desirable to start them laying.

LAYING HENS SHOULD TAKE EXERCISE FREELY.

During the spring season fowls having free range get abundant exercise. Close confinement without exercise is not conducive to the best results, although the feed provided may be the best, for idle hens soon grow too fat to lay. It is almost impossible to give laying hens which are confined too much exercise. The fowls may be encouraged to exercise in various ways, such as feeding corn on the cob, suspending cabbage heads, beets, etc., so that the birds have to jump for them, and scattering grain in the litter. The litter should be from 4 to 8 inches deep, and may consist of straw (either cut or whole), hay, leaves, buckwheat hulls, shredded corn fodder, or any convenient material of this nature. The hens should be kept hungry enough so that they will work diligently all day for the grain scattered in this litter, which should be removed whenever it becomes damp or soiled.

The odor of whatever soils an egg will soon penetrate the shell and flavor the contents. Keep the eggs clean.

GET BABY CHICKS NOW—Write for free booklet on fall chicks. See why they pay. Several varieties very week. Only good, strong youngsters shipped. Stubbe Poultry Ranch and Hatchery, Box 67, Palo Alto.

EASTMAN'S BRED TO LAY—Hogenized and trapped Barred Poultry Rocks. September chicks. Fairmead Poultry Farm, Fairmead, Calif.

FALL BABY CHICKS—Rocks, Reds, and White Leghorns; choice stock. Place your order in advance to insure prompt attention. Santa Clara Valley Hatchery, San Jose, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Voden, Box 3, Los Gatos, Calif.

WRITE FOR SPECIAL PRICES on Fall chicks. Willow Glen Poultry Yards, 10 South Lincoln Ave., San Jose.

ROCK, RED OR LEGHORN baby chicks—large or small lots. Right prices. Madera Hatchery, Madera, Cal.

FALL BABY CHICKS from our large heavy-laying S. C. White Leghorns. Send for prices. Tupman Poultry Farm, Box 7A, Ceres, Calif.

Male birds should be confined or disposed of as soon as the hatching season is over. This will provide infertile eggs, which will keep much longer than fertile ones. Hens will lay just as many eggs without a male bird as with one.

DR. HESS Instant Louse Killer Kills Lice

**For Use
On Your Poultry**

Seize the hen and dust Instant Louse Killer into the feathers. The handy sifting top can makes it convenient to use. Sprinkle it in the nests, on the roosts and floors. Put Instant Louse Killer in the dust bath occasionally—your hens will do the rest. This means louse prevention.

FOR STOCK

With one hand stroke the hair the wrong way, with the other sift in the Louse Killer. Especially good for lousy colts.

GUARANTEED. The dealer will refund your money if it does not do as claimed.

1 lb. 30c, 2½ lbs. 60c (except in Canada)

Dr. HESS & CLARK
Ashland Ohio

"I would never hatch another chick without one"

says John F. Forney, a successful poultry raiser of Kingsburg, Cal., "—if I could not have all my machines equipped with your regulator. The heat does not vary one-fourth of a degree during the last three or four days. Its action is almost human." Many others write us about the

CHARTERS REGULATOR

(Readily attached to your incubator. Part of the equipment of Charters Incubator.)

How it works:

It's the two thermostats that do the trick, one outside and one in the egg chamber, actually anticipating any change of temperature and automatically adjusting the size of the flame. The temperature outside may vary as much as 70 degrees, without producing as much as half a degree of change in the egg chamber. With the Charters you will not need an incubator cellar.

The big tank holds a fuel supply capable of running the lamp from 2 to 3 weeks. That means only one refill and trimming of the wick a week.

P. R. Lyding of Sebastopol, with twenty-six years of incubator experience, writes: "Your Regulators complete are absolutely the best I have ever used. I installed them myself—and can feel sure when machines are hatching, if unwatched, temperature will not vary to exceed one-half of a degree."

J. H. Stubbe, of Palo Alto, writes: We need not give the lamps any thought at night. The Regulator takes care of any changes in temperature perfectly. It is certainly a relief."

Many big hatcheries operating upward from one-hundred machines, are discarding all others and using Charters Regulators and Incubators exclusively. Owners of only one machine are finding the Charters Regulator a treasure.

Write today for free catalogue—or better still—let us have your order now, for your Charters. The Regulator is \$10; the incubator (equipped with Regulator) is \$65.

Remember: If the Charters Regulator and Incubator do not do what we claim for them—your money back.

See The Charters at principal fairs and poultry shows this year.

THE HOME CIRCLE

A RECIPE FOR PEACE WITHIN.
(According to St. Paul.)

Edith A. Talbot.

First, of rejoicing freely take—nor
stay thy measuring hand;
Ingredient too oft forgot,
It maketh raised and light the lot.
Then prayer; lacking this solid stuff,
thy mixture will not stand.
This, e'er thy chiefest stay,
Must be renewed each day.
To savor well thy mixture now, use
moderation duly,
That all may reckon fit
The pleasant taste of it.
Thou must keep clean thy mixing-
bowl from petty wishes truly;
Give them to Him above,
He will thy wants approve.
Then add for salt a dash of thanks,
which thou must ne'er forget.
So shalt thou have, for nought,
Sweet peace beyond thy thought.
This recipe is one, good friend, which
ne'er hath failed yet.

LITTLE BEAR AND THE LOST OTTER BABY.

One morning, while Little Bear was out camping with his father and mother, he went into the woods to pick daisies and bluebells, with which to decorate the entrance to their cave. His hands were full of flowers, and he was ready to go back with them to his mother, when he heard a baby crying. Little Bear stood still and listened; then he knew that the child who was crying was an Otter baby; he had heard Otter babies cry before.

"What is the matter, baby one?" called Little Bear. "What are you crying about and where are you? Did you bump your nose?"

"I am lost! Come and find me!" answered Baby Otter.

"You are hiding behind the oak stump!" exclaimed Little Bear, as he scrambled through the thicket and fairly pounced upon Baby Otter. "I spy!" he shouted.

"It isn't a game!" wiled the Otter Baby. "I tell you I am lost! I don't know where my mother went and I can't find my father! I want to go home! Oh, boo-hoo-hoo!"

"There, there, don't cry!" said Little Bear. "Tell me where your camp is, and I will take you home just as fast as we can go."

"But we do not live here!" com-

plained the lost baby. "Our home is Brookside, a long way off across country, and we are only camping out, and I do not know where our camp is! Boo-hoo-hoo-hoo!"

"Come, come, cheer up!" said Little Bear, using the very words his father often used when speaking to him. "I tell you I will take you home, and if it is too far away I'll ask my father to go. We are camping out, ourselves, down the river a little way. Now tell me how you happened to get lost."

So the Otter baby told him that the Otter family had gone out together after breakfast that morning, and that while they were laughing and chatting Baby Otter had strayed away from the path to pick flowers. The next thing that he knew he had been alone, and, not knowing what else to do he had sat down and cried.

"Well, wipe your eyes now, and give me your paw!" said Little Bear in big, grown-up tones. "My father showed me your camp only yesterday, and, and, if you are one of the campers, you live only a little way from here and I can take you home."

Of course Baby Otter wiped his eyes and walked happily behind Little Bear; he wished to travel in single file, Otter fashion.

It happened that Father Bear had been teaching Little Bear how to follow the wood's trails, and Little Bear knew the Otters' path, because they always went round stumps and under logs; besides, their legs were short and their bodies so heavy that they left well-worn trails behind them.

At last Little Bear reached the end of the crooked path, and Baby Otter, without so much as saying, "Thank you!" to Little Bear, ran to the cave by the river-bank where his family were camping out.

"Some people always forget their manners," said Little Bear to himself as he ran home to tell his father and mother what he had done.

"I am glad you were good to the baby," said Little Bear's mother as she took the bluebells and daisies that he had brought and put them into a hollow stump beside the cave door. She had filled the stump with water from the spring while Little Bear was gone.

"The flowers are lovely!" said Mother Bear. "Now please run into the woods for some green leaves and vines to put with them, Little Bear."

Before he could do as she told him, Uncle John Kingfisher came flying to invite the three Bears to a party. "The Otters," said he, "request your presence at a fish dinner. Come now."

"We thank you, Uncle John Kingfisher," said Father Bear. "We will start at once. Come, Little Bear, wash your hands and face and get ready."

That is how it came about that the three Bears dined with the Otters that day, on trout, salmon, and eels, and were served with only one bite from each fish, and that bite taken from the meat just behind the head. Mother Bear thought that the Otters chose only one dainty morsel from each fish just because they had invited company for dinner; but Father Bear told her afterward that she was mistaken; Otters always serve fish in that way when fish are plentiful.

After dinner the Otters and their guests rested for a while, and then Father Otter urged the children to come out and play with him and with Mother Otter. Said Mother Bear to Mother Otter, at last, "We thank you for inviting us over. If you ever wander into our home woods, come to our little house and have porridge with us."

"We shall be glad to do so," said Mother Otter, "and we shall always think kindly of Little Bear because he brought our baby home when he was lost. If we do go to visit you, you must let us make Little Bear a toboggan slide."

"Ask them to come as soon as we get home!" urged Little Bear in a whisper to his mother, so loud that the Otter children heard it, and laughed.

And that night Little Bear dreamed

of taking home a baby otter and of being invited to slide down that baby otter's toboggan slide all the afternoon.

CARE OF SILK STOCKINGS.

The laundering of silk stockings should be done apart from the regular wash, for they will not last as they should, if abused. White or colored silk stockings should never be soaked, but washed out quickly in warm water and a good white soap, and then

thoroughly rinsed. Then they should be wrapped in a coarse towel and wrung out as dry as possible before being hung in the shade to dry.

The life of black silk stockings may be prolonged by soaking them over night in cold water before they are ever worn. All silk stockings, and in fact, all silk underwear, should be washed after each wearing as the perspiration of the body rots the silk. Silk stockings should be purchased plenty large and an added precaution for breaking at the toe, is to darn the

DREADNAUGHT
BLAZING AWAY IN COST-DEFENSE!

Last Call

This is the last call for the little Burner at six-fifty—the price must go to \$7.50 to meet the increased demand for labor and material. New prices for foundry and machine shop went into effect immediately. The best we can do at \$6.50 is to agree to fill all mail orders post-marked on or before September 27th.

At that, the Burner remains the biggest little bargain in home cost defense ever offered the public. A clean, dry gas, full in heat units and thrift value. Without any changes, the old stove becomes far more effective than ever before, with

drudgery entirely eliminated. The Dreadnaught Burner is clean, honest and fully guaranteed.

Price change does not effect the hot water heater—the Super-Sixty Burner—the wonderful little steamer, or the No. 7 Furnace Burner

Write for circular—get your order in quickly

MAIL THIS COUPON

Find out how to save tons of fuel this winter and yet enjoy better heating!

PUT in a Mueller Pipeless Furnace and flood your house with moist, healthful heat at a saving of $\frac{1}{3}$ to $\frac{1}{2}$ on fuel cost.

The Mueller Pipeless is guaranteed to heat every room in your house comfortably. And thousands of installations prove the sincerity of this written guarantee. The Mueller

Pipeless is so designed and constructed that it never fails.

Mueller heating engineers designed a better pipeless furnace because they had 62 years' experience in the building of heating systems. No wonder then that the Mueller Pipeless scientifically and correctly applies the laws of air circulation and gives the utmost satisfaction to home owners.

MUELLER
PIPELESS
FURNACE

It is properly and accurately proportioned throughout. Eight sizes—one to fit every home. Easy and inexpensive to install. Burns all fuels.

The interesting book, "The Modern Method of Heating Your Home," explains in detail the many features of construction that make it possible for the Mueller Pipeless Furnace

to give such dependable heating service and still save you tons of fuel. We'll gladly send it to you FREE—just fill out and mail in the coupon—NOW!

toe until it is well reinforced. A piece of velvet pasted on the inside of the heel of a pump will prevent the rubbing that so often breaks the silk on the heel.

Care in putting on the stocking will prevent the runs that are the despair of everyone. Be sure the toe-nails do not catch a thread and start a run that many ruin an otherwise perfectly good stocking.

MAKE FARM HOME ATTRACTIVE.

Trees and shrubs should be a part of the setting of every home. They add value to the farm by making it more attractive and homelike. When we find a home set in the midst of trees and shrubs well arranged it has a cozy and attractive appearance, and we are instinctively drawn to it.

We immediately think of home, children, flowers, birds, music, etc. I love to think of trees and shrubs as musical instruments which attract the birds, for we all know it requires trees, shrubs and groves to induce them to build nests near our dwellings. Then they will live with us, sing for us and eat the bugs, worms and insects the whole livelong summer. Many of the birds that live upon the insects and bugs which destroy our gardens and crops are not to be found where there are no trees, shrubs or groves.

I have always found it wise in selecting trees and shrubs to choose

those best suitable to one's locality, that is, that have been grown under conditions similar to those of the locality. In this way, one is nearly always sure to meet with success instead of failure as when plantings are made not suited to one's locality.

One can easily make their own observations as to which are the best varieties by making note of those grown by neighbors. When possible, examine the trees, shrubs and groves. In this way you will find the varieties that could not withstand the wind, sun and cold. In this class we will find the broken partly dead and entirely gone trees and shrubs. These should not be considered.

On the other hand one will find other varieties that are thrifty and healthy, giving good results and these are the ones to plant in your locality.

This will not take a great deal of one's time, but it often saves a great amount of time, work and money later on.

When varieties are planted, that are not adapted to the locality, the trees and shrubs are weakened by the sun, drouth and severe weather, thus making them more susceptible to the different insects and fungus diseases. This soon causes them to die.

The horticulturist at the agricultural college is always in a position to give good advice as to methods of planting, pruning etc.

Trees and shrubs are usually lost on account of planting improper varieties, improper cutting back at the time of planting and lack of proper care after planting.

Trees and shrubs are often planted just as received, the tops never cut back. The result is that the tree started to grow, but the root system was not sufficient to take care of the top and in a few weeks the leaves start to wither and then it is good-bye tree, for the poor thing soon dies.

Or for instance, if the soil around newly planted trees or shrubs is left to bake and crack and weeds left growing, one can not expect results. Therefore, remember to plant varieties, adapted to your locality, back properly and then give them the proper care.—Selected.

CLEANING OF SILVER.

There are many ways of cleaning silver, more or less easy. The old-fashioned way of rubbing each piece separately with a dampened powder, necessitated careful washing afterwards. Then there are the aluminum pans with racks for the silver, so there is no rubbing required, only a thorough drying. Now there are pastes on the market which do wonders in removing tarnish and discolorations, but the easiest way of all to clean it is to rub with the prepared cloths which can be found at any good store. This method requires no washing at all; in fact, the cloth can be used just as the silver is being put upon the table for use.

WHITE GRAPE PRESERVES.

Wash grapes and remove the seeds, if the seedless variety are not obtainable. Cook with very little water until soft, skins and pulp, then add cup for cup of sugar. Cook slowly for about an hour; longer, if necessary to have a stiff preserve. Just

food

MARKET COMMENT

Beet Sugar Advances.

Western beet sugar producers have advanced their price to 11½¢ New York basis. This translated into trade terms means a cost basis at point of production equivalent to \$11.25 per pound less 2 per cent for cash, or 11¢ to the producer.

Northern California Lambs Lower.

Sheep and lambs are selling around Alturas for less money than for a number of years and the demand is light. Some sales have been made at \$5.50 and \$4.50 per head, which is half the price received last year.

Rice Millers Stand Pat.

The recent Government agitation in regard to the high cost of living caused uncertainty and some depression in the rice market. However, ideas of California millers have not changed appreciably and futures are generally being offered at \$11.25 for fancy and \$10.50 to \$11 for choice, October-November shipment.

Beef Slump Explained.

Conditions of the food markets in the world indicate to the Institute of American Meat Packers, recently in session in Atlantic City, N. J., that the demand for beef from America for meeting shortage in Europe has about ceased, and that the demand for pork is slackening, while in the United States the agitation against the packers has caused a slump in the consumption.

Produce Destroyed to Maintain Prices.

Substantiation of the charges that tons of vegetables are being destroyed by Japanese growers near Los Angeles to maintain high prices was contained in reports gained after a semi-official investigation. At the same time imported vegetables are selling at a lower price than local products in this city. A reduction in price of tomatoes at Japanese roadside stores from 50 to 35 cents a box became effective recently.

The Hide Situation.

The market in country hides is quiet and unsettled. Many dealers are closely sold up on light-weight stock and continue to talk higher prices. Firm bids of 2c to 3c under asking prices for good quality extremes effect some trading. Canada has placed an embargo on hides and skins because of the high prices prevailing in the domestic markets. Australia, however, has released hides and leather. During the fiscal year, ending June 30, 1918, we imported 3,279,729 pounds of hides and skins from Australia. Nearly two-thirds of these shipments were sheepskins.

Prunes Marketed by Express.

For the first time in the history of the industry California prunes were shipped by express last week by the California Prune and Apricot Growers, Inc., to speed the delivery to markets in the United States clamoring for immediate stocks from the 1919 pack. H. G. Coykendall, manager, says that the original estimates of a 275,000,000 pound crop will probably be fulfilled unless adverse weather conditions again damage the crop. Of the total crop, the association is counting on packing and marketing from 180,000,000 to 200,000,000 pounds, the largest crop the California farmers have had in the history of the industry.

Inter-Mountain Alfalfa Prices.

The feed and hay situation in inter-mountain regions is reported as very serious. Alfalfa is short in all of the irrigated sections of Idaho, Montana, Wyoming, Colorado and Utah. Range conditions also are reported as serious and many cattle are being shipped to eastern points for feeding purposes. Alfalfa hay at Blackfoot, Idaho, is selling for \$26 per ton baled, and as a concession to home feeders, was offered loose in the field at \$17.50 per ton, which was refused. Nevada growers of alfalfa have been undecided as to prices for this year's crop, owing to the lack of early demand for alfalfa hay from cattle feeders, but indications point to good prices for this great feeding stuff this year.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO.

San Francisco, September 17, 1919.
WHEAT.

The supply of wheat seems ample for all demands in San Francisco, although it is stated that arrivals are slow. All grain markets are dull.

No. 1 hard	\$2.20

BARLEY.

While quotations for barley are unchanged the grain is in reality weaker. Future barley is not materially different from the spot grain.

Feed	\$3.00 @ 3.05
Shipping	\$3.20 @ 3.30

OATS.

There was practically no demand for oats this week and quotations are nominally unchanged, although the grain is weak at present prices.

Red, feed, per cbl	\$2.90 @ 3.10
Red for seed	Nominal
Black for seed	Nominal
Re-cleaned Red or Black for seed	Nominal

CORN.

Corn is suffering from the same stagnation as the other grains, although there seems to be a firmer undercurrent.

California	\$3.80 @ 3.90
Egyptian, choice	Nominal
Milo	Nominal

HAY.

Receipts of hay for the past week were 2,722 tons compared with 2,800 the previous week. As has been the case for some time past, the majority of these receipts were by water from bay and river districts. The car situation has not improved any during the week, and in fact has become more acute. As a consequence large amounts of hay has gone into warehouses at shipping points to protect it from possible rain. The market in the city has run along about the same as heretofore.

fore. Demand from country districts has slackened off considerably.

No. 1 Wheat, or Wheat & Oat	\$15.00 @ 18.00
No. 2 Wheat, or Wheat & Oat	\$12.00 @ 15.00

Stock Hay	\$ 8.00 @ 12.00
No. 1 Barley Straw, per bale	50 @ 80

FEEDSTUFFS.

Roller barley was weaker and the quotations were lowered slightly this week. While roller oats were also very weak their price was well maintained.

Roller Barley	\$63.00 @ 64.00
Roller Oats	\$62.00 @ 63.00
Cocanut Meal	\$48.00
Cracked Corn	\$79.00 @ 81.00
Alfalfa Products	\$38.00 @ 40.00

POTATOES, ONIONS, ETC.

A shortage of cars is affecting the vegetable market, and little is arriving except by boat. Potatoes are dull at unchanged quotations. For onions a lively demand has arisen—and the price has been advanced. A good many onions are now going into storage and this is the main reason for the advance. Tomatoes are now at about the height of their season. Their quality is excellent and at present prices are proving an attractive buy. The rest of the market is firm with little change in prices.

Large whites	\$6.50 @ 6.90
Small whites	\$7.50 @ 7.75

POULTRY.

The strike of the poultry pickers is still in progress and is the main cause for the weakening market. The poultry pickers are firm in their demand for the increase, and it is said that they have applied for admission into the American Federation of Labor. Local dealers say that the market is at present overstocked with young chickens, notwithstanding notices sent out at the beginning of the strike. Good hens, ducks, geese and turkeys can be handled, however, as these sell readily to the Jewish trade, which attends to its own picking.

Turkeys, dressed, young spring, lb.	50 @ 55c

Jack rabbits	\$1.00 @ 4.00

BUTTER.

The receipts of butter have not been heavy this week and the price is firm at the close. The weekly fluctuation of only two cents from the low to high is considered small. Some of the dealers have been making heavy inroads on their private stocks and more butter was withdrawn from storage this week than for some time past. The fact that Great Britain has resumed the importation of butter from Denmark after a considerable period of almost exclusive dependence on the United States, and that Argentina is now shipping large quantities of butter to the same market, is likely to have an effect on supplies and prices of butter in this country and may eventually affect the local market.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	60½	58½	59½	59	59½	60½

EGGS.

Extra eggs were steady and showed a fluctuation of only a cent and a half during the week. Pullets and underlayers were both higher.

DRIED FRUITS.

Apples and apricots showed lower prices this week, but otherwise the quotations of last week still prevail. Some of the jobbers believe that the agitation regarding the cost of living is going to cause a decline all along the line in dried fruits, but there is nothing directly and exclusively connected with dried fruits to warrant any such belief. There is some hesitation on the part of jobbers about buying in the present market.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., September 16, 1919.

Under moderate offerings of Bartlett's during the past week, the demand remained strong and prices advanced towards the end of the week; in a few specific instances the price on good, firm storage stock realized the top market for the season.

Favorable Eastern weather conditions permitted the outdoor display of fruits, which stimulated the demand on practically all varieties, both Malagas and Tokays having first call, with the Tokays showing a slight preference over the Malagas.

The only reaction noticeable in any of the markets was on freestone peaches. The demand lessened somewhat from the week previous, though there was a noticeable advance in the sale of clings.

Plums of all varieties being offered ruled firm, though the offerings were somewhat scattered, as the shipments are now very light and confined to those en route.

Regardless of the fact that the established wine grape buyers are purchasing moderately, on account of the activity of Federal inspectors, all cars of wine grapes that are arriving in a condition suitable for their manufacture into wine are receiving a very ready demand and at prices considerably higher than last season.

The car shortage that has prevailed during the past week in California has been serious and as a large percentage of the grapes have been held in warehouses for four and five

days at a time awaiting the arrival of cars, their quality has unquestionably been affected, which will result in considerable inferior stock being forced upon the markets, which will have a depressing effect upon conditions generally. The car situation is somewhat easier at this writing.

If weather conditions remain favorable, the movement of grapes should be very heavy for the next thirty days. We predict a strong demand for all varieties at good prices.

Averages for the week:

NEW YORK: Bartlett Pears, \$5.27; B. Hardy, \$4.45; B. Clairgeau, \$4.70; Winter Nellis, \$3.55; Orange Cling Peaches, \$1.90; McDevitt, \$1.90; Salways, \$1.16; Levi, \$1.90; Phillips, \$1.05; Grand Duke Plums, \$1.90; Giant, \$1.06; Gros, \$1.97; Malaga Grapes, \$2.40; Tokays, \$2.83; Muscats, \$1.42; Rose Peru, \$1.77; Thompson Seedless, \$2.17; Cornichon, \$2.50; Alicante Bouchet, \$2.15; Zinfandel, \$1.93.
--

BOSTON: Orange Cling Peaches, \$1.50; Salways, 96c; Bartlett Pears, \$4.41; Winter Nellis, \$3.65; Hungarian Plums, \$2.07; Gros, \$1.85; Grand Duke \$1.77; Malaga Grapes, \$1.77; Tokays, \$3.80; Rose Peru, \$1.75; Thompson Seedless, \$1.55; Zinfandel, \$1.78; Alicante Bouchet, \$1.80.
--

Chicago: Malaga Grapes, \$1.93; Tokays, \$2.20; Thompson Seedless, \$1.70; Muscat, \$2.15; Zinfandel, \$1.45; Black Prince, \$1.05; Bartlett Pears, \$4.25; Gros Plums, \$2.40; Hungarian, \$2.05.

Special Livestock Market Report

San Francisco, Sept. 20, 1919.

CATTLE—Many of the cattle coming into this market at the present time are from the Nevada grazing grounds, and are mostly of good quality. The supply is ample for the demand, and all are being taken care of.

Steers, No. 1, 950-1100 lbs.	10 @ 10½c
do, No. 1, 1100-1800 lbs.	9½ @ 10c
do, 2nd quality	8 @ 8½c
do, thin	6 @ 7c
Cows and Heifers, No. 1	8 @ 8½c
do, 2nd quality	6½ @ 7½c
do, common to thin	4 @ 5c
Bulls and Stags, good	5½ @ 6½c
do, fair	4½ @ 5½c
do, thin	3½ @ 4½c
Calves, lightweight	12 @ 12½c
do, medium	11 @ 11½c
do, heavy	8 @ 9c

SHEEP—The equation between supply and demand for mutton sheep is maintained in this market, with a strong undertone to the lamb and yearling situation.

Lambs, Yearling	10c
do, Milk	12 @ 12½c
Sheep, wethers	8½ @ 9c
do, ewes	6½ @ 7c

the next week or two will witness a further decline.

Hogs, hard, grain-fed, 100-200	16c
do, 200-300	15½c
do, 300-400	14½c

Los Angeles, Sept. 16, 1919.

CATTLE—This market is steady with fair demand reported. Only one item changes since last report. Calves quoted 50c higher.

Per cwt. f. o. b. Los Angeles:	
Beef steers, 1000 @ 1100 lbs.	\$9.50 @ 11.00
Prime cows and heifers	\$8.00 @ 9.00
Good cows and heifers	\$7.50 @ 8.00
Canners	\$5.00 @ 5.50
Calves	\$10.50 @ 13.00

HOGS—Demand is fair, but light, quoted 50c since last week. No other prices changed.

Per cwt. f. o. b. Los Angeles:	
Heavy averages 275 @ 350 lbs.	\$12.50 @ 14.00
Heavy averages 225 @ 275 lbs.	\$14.50 @ 15.50
Light	\$15.50 @ 16.00

Rough docked 20 lbs. piggy sows 40 lbs. and stags, 40 per cent.

SHEEP—Lambs and yearlings reported to be in good demand. All prices the same as a week ago. Ewes and wethers slow sale.	
Prime wethers	\$8.50 @ 9.50
Yearlings	\$8.50 @ 9.50
Prime ewes	\$8.00 @ 8.50
Lambs	\$12.50 @ 13.50

LOS ANGELES.

Los Angeles, September 18, 1919.

BUTTER.

Receipts not quite so heavy as last week. Demand is reported to be very good. An advance of 1c will be noted over last week's quotations. For the week, receipts were 261,800 lbs.

California, extra creamery62c
do, prime first60c
do, first59c

EGGS.

This market is lower in prices on fresh ranch and pullets. Receipts also below last week. Demand holding up well. Receipts for the week, 417 cases.

Fresh ranch, extra58c
do, case count57c
do, pullets49c

VEGETABLES.

Offerings are lighter and the demand is good for all fresh stuff at better prices.

OPENING PRICES ON ALMONDS FOR 1919.

The entire crop of almonds for this year has been contracted for. Shipping, which commenced the last of August, will continue for about five months. The crop is estimated to total 7,000 tons—the largest in the State's history—with a value of \$3,000,000. The opening price to the trade by a California Almond Growers' Exchange, which practically controls the entire crop, is as follows: Nonpareils, 32 1/2 cents a pound; I. X. L.'s 31 1/2 cents; Ne Plus, 30 1/2 cents; Drakes, 23 1/2 cents. These prices apply to business already closed, and provide a discount of 1 per cent for cash in 10 days. New business is booked 1 cent higher. These prices will net to the grower about 28 cents a pound on Nonpareils, 25 cents for I. X. L.'s, 25 cents for Ne Plus, and 19 cents for Drakes—an advance of about 5 cents over last year's, and are in line with trade

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Weissbaum Pipe Works, 160 Eleventh street, San Francisco.

CROLEY'S BALANCED HOG FEED—The cheapest feed to fatten hogs. Write Geo. H. Croley, Townsend St., San Francisco, Calif.

WANTED—A competent married man to operate small fruit ranch. Wife must be willing board extra help in harvest. Permanent place. Address, stating experience, Box 1660, Rural Press.

MADE OF REDWOOD, Hawley's Perforated wooden well casing, the best and cheapest well screen made. Send for descriptive circular. G. M. Hawley, La Mesa, California.

FOR SALE—Yuba 12-20 tractor, 1915 (double clutch) model, well kept up, good running order. A bargain. Owner has purchased larger tractor. B. Guillon, Windsor, Cal.

SWEET CLOVER SEED for sale.—Buy direct from the producer and save money. Fine, clean seed, 25 cents per pound. Write Geo. D. Forest Jr., Standish, Calif.

WE WILL SELL new Cleveland tractors while they last at \$1,395.00; also one second-hand Cleveland tractor, almost new, at \$850. F. H. Stow Tractor Company, Berkeley, Cal.

WANTED TO BUY.—Second-hand hog wire, 34 to 36 inches high. Enough to fence 20 acres. Must be in good shape. W. J. Cardia, Blythe, Riverside Co., Cal.

TRACTOR FOR SALE—Holt Caterpillar 30, fine running order. Engine and connecting rod bearings all new. Price very reasonable. Address B. F. Hoffman, Byron, Calif.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

DAIRYMAN wants place on shares or for wages. Experienced and reliable. Have family. Address, Box Y, Pacific Rural Press.

A NEW ALFALFA—Investigate now. Our great "Hardy Hybrid" alfalfa. For facts, write J. L. Lawson, San Jose.

12-20 YUBA TRACTOR, used very little. P. M. Pederson, Oakdale, Cal.

COUNTRY LANDS.

FOR SALE—Good dairy ranch, Humboldt county. Well improved. Write B. F. Gibson, McKinleyville, Cal.

FOR SALE—Alfalfa ranch of 23 1-3 acres, stanchions for 20 cows, house, separator house, garage, chicken houses and other out-buildings. If interested address Box 58, Esposito, Calif.

STOCK RANCH for sale—about four thousand acres. A good sheep ranch—plenty of water and wood. Good buildings. Most of ranch fenced. Terms, if wanted. Address Box 139, Middleton, Lake co., Calif.

IDEALLY LOCATED RANCH, northern Sacramento valley, on main line of S. P., flag station at gate, one mile to highway. Over 400 acres, 325 acres under main ditch of irrigation system, about 50 acres fine stand oak timber, 30 acres leveled and checked ready for alfalfa or corn, 75 acres more easily leveled, 7 acres pears, all fenced and hog tight; 6-room house and bath, tank house, new barns, shop and sheds, corrals, etc. Well concreted, with water piped to house and lots, 10 head good work stock, 20 head dairy stock, about 80 hogs. Wagons, disk, plows, scrapers, etc. Good stands of rice in vicinity. Terms, \$15,000 down, balance 10 years. Box 1670, Pacific Rural Press.

60 ACRES, PAIR HORSES AND

4 cows, heifer, poultry, turkeys, wagons, separator, mowing machine, full line tools, crops, etc.; 2 1/2 miles high school town, near R.R. city, trolley. Machine-worked fields, 10-cow pasture, wood, timber, orchards. 7-room, furnace-heated house, large barn, hog, poultry houses. Aged owner sacrifices all for quick sale. \$2750, easy terms. Details page 23, Fall Catalog, just out. Write for your free copy this big 100-page book of farm bargains from Maine to Florida and west to Nebraska. STROUT FARM AGENCY, 831AF, N. Y. Life Bldg., Kansas City.

RANCH FOR SALE—240 acres, 6 miles E. Santa Margarita, Calif. 25 acres orchard—apples, pears, prunes, peaches; 50 acres cleared; 50 acres level. Live oak on hills. 4-room house and bath; outbuildings. 8 tons hay, machinery, buggy, wagon, harness, cow, horses, bees! School on place. Write Mrs. Bertha Boomer, Santa Margarita, Cal.

DAIRY AND ORCHARD RANCH for sale by owners, about 120 acres. Good location, new buildings. Will be sold on easy terms and reasonable price. \$10,000 will be accepted as first payment. Alex T. Gibson, P. O. Box 561, Chico, Cal. Residence, 216 East 1st Ave., Chico Vecino.

FOR SALE—an improved 80-acre ranch, sandy loam; no more productive soil in California; all under irrigation; stock and equipment; 1/2 mile from paved highway. Address, Owner, Box 79, Maxwell, Cal.

FOR SALE—Ranch, Contra Costa County. 22 miles southwest Brentwood. 36 acres alfalfa, 5 acres orchard. Improved. John E. Davis, 3221 Illinois Ave., Fresno, Calif.

Look To Leadership Every Time

THE SAME leadership in industry which saves America from the perils of a laggard nation, puts pleasure and profit in modern farming. And it gives you in Remington UMC the same modern service for your shooting.

No other manufacturer has made so many important improvements in arms and ammunition as has Remington UMC. The latest in shot shells is the wonderful Wetproof improvement. The wettest day, the leakiest boat, can not spoil your shells if they are Remington UMC Wetproof "Arrow" or "Nitro Club" smokeless or "New Club" black powder.

No matter how "wet," they will not swell, bulge, broom out at the crimp, mush up or scuff. Work them through your Modern Remington UMC autoloading or pump gun and they will slide as smoothly, fire as surely and give the same superior speed, pattern and penetration for which Remington UMC steel lined speed shells are famous.

The best sporting goods and hardware dealers all over the United States—in all more than 82,700—recognize Remington UMC leadership by extending Remington UMC Service to Shooters.

SEPTEMBER 27, 1919

LOS ANGELES

Monterey County is Finding Herself

Written for Pacific Rural Press by R. E. Hodges.

A GIANT is shaking off the shackles of the ages. He does not yet know a tithe of his own power. But his muscles are getting a steadily increased exercise and they are mightily increasing in strength. This giant of untied and unknown strength is one of the oldest of his family; for Monterey county was one of the first to be settled in California and the visitor to Monterey city is likely to be surprised at any turn by a sight of something that was the first of its kind in the State.

Our giant's bonds have held him back from his proper place among the members of his own race. Many of his younger brethren have outstripped him in development and usefulness. But he is bursting his bonds, and a greater freedom, usefulness and happiness are coming to those who depend on him.

Our Giant's Grand Physique,

Back of Monterey and its deep blue bay is a line of coastal mountains extending indefinitely southeastward. Back of these, but opening into the broad plain facing Monterey Bay, lies the valley of the Salinas river, over 100 miles long in Monterey county and coming from a source far beyond her borders. Another riot of mountains forms a lovely background along the easterly side of this valley.

In both of these ranges are small valleys already developing agricultural and horticultural importance; and the horticultural possibilities of thermal belts along the foothills are beginning to be realized. But wonderful Salinas Valley, land of unlimited possibilities!

A thousand square miles there are in the Salinas valley—all ready for the plow. No alkali or hardpan, no swamps, but underlaid at most points by plenty of water at practicable pumping depths, and nowhere worn out by the long-continued grain cropping to which it has been subjected. Some may dispute this latter statement, but fortunately it is based on actual agricultural accomplishments in this same valley. The soils are rich and deep, the climate was designed for field crops, fruit, and livestock—neither too hot nor too cold and with no great variations in temperature.

Easy Transportation for Farm Products.

For commerce, a mainline railway traverses the entire valley, connecting it with San Francisco, about 100 miles north and with Los Angeles, about 300 miles south. Smaller railways serve more local interests, one of them connecting the main valley with Monterey Bay, of whose surpassing commercial possibilities we will say more later. Three good roads traverse the valley lengthwise, one of them being the paved State Highway. Other pavements connect local points, including two routes to Monterey city from Salinas, which is the county seat.

The Giant's Preliminary Accomplishments.

Even in its present undeveloped condition, Monterey county's agricultural products have contributed no small amount to a hungry world. Last year's barley crop was about 16,000 tons, beans, 9,000 tons, wheat 1,100 tons, 1,500 tons of "Salinas Burbank" potatoes, about 180,000 tons of

sugar beets, 80,000 or 90,000 tons of alfalfa, practically all of which was fed in the county, around a million pounds of butter, four million pounds of cheese, several hundred thousand cases of condensed milk. How many beef cattle were sold we could not learn. The assessor's figures for livestock, as reported to the State Board of Equalization for the year ending June 30, 1919, show 56,500 cattle of all kinds in the county, 7,000 hogs, and 35,000 sheep. But the assessor himself feels certain of only one feature in regard to these figures—they represent only a part of the total. His figures on fruit trees show 107,000 apples and not that many of all other kinds put together. But the county

tile and uniformly productive soil, climatic advantages, desirable living conditions, transportation facilities, so long neglected the fuller use of its talents?

The answer is short. This vast domain of hill and valley was coveted in the earliest days by powerful families, who obtained large grants of the land and held them intact for generation after generation to the present day. Probably a dozen families own more than half of the acreage in the county. They could not farm any considerable proportion of their land themselves. Consequently they stock most of it with cattle, which made easy romantic money. They rented some of the farm lands

held largely by a few interests and rented to supervised tenants. Here are being worked out some of the best agricultural practices in the Valley. Sugar-beet farming has taught many lessons on the value of deep tillage. More irrigation each season is evidenced by new pumping plants that dot the landscape. The value of drainage is realized as shown by a system of drainage ditches now being dredged. Sugar beets, beans, barley, alfalfa, potatoes, corn, vegetable seeds, etc., thrive here.

Step over to the Pajaro Valley and the Aromas district, bordering the extreme north end of the county, and picture in your mind a greater extension of their apple and apricot orchards into Monterey.

Swing back on the boulevard that borders the Bay to Monterey city. Let them tell you there how the great Pacific armada of the American war fleet anchored within a few hundred yards of the beach in water a mile deep. That incident did much to interest the Government in a proposed breakwater, which is all that is needed to make Monterey Bay one of the chief Pacific ports of commerce when the country behind it shall have been developed. Let them show you a temperature chart that will make you want to stay there.

But climb over the Carmel hill and drive past the Carmel Valley alfalfa fields, dairies, and grain fields, to that inspiration point, whence you look down onto a veritable carpet of luxuriant fruit trees, surrounded by mountains. Go down the coast into the Sur country to see more possibilities.

Come back by way of Salinas and prepare for a magnificent drive of varied experiences in a big country. As you travel southward, swing off to the right or left occasionally onto the table lands and into the foothills. There note the old family orchards planted by early settlers and still loyally producing fruit in spite of neglect. You will find them from one end of the county almost to the other.

As you pass through the Chualar-Gonzales-Soledad district, feast your eyes on the luxuriant green alfalfa and contented cows. See the grain fields on the higher lands handy to complete the dairy ration.

Turn off from Soledad, note the poultry and garden farms of Fort Romie, one of the few Salvation Army settlements, and drive a few miles up the Arroyo Seco. You will at this season find most of its bed entirely dry. The several small irrigation systems which use water from the Arroyo during spring and early summer are dried up now and you will wonder why they have not banded together to build a dam at some one of the grand succession of narrow, rock ribbed, vertical sided gorges to hold the winter floods for summer use and at the same time reclaim great areas of wash lands below the opening place of the Arroyo onto the Salinas Valley.

Cross the Arroyo and drive through a few miles of the heavily loaded apple and apricot and almond trees of the Greenfield colony, one of the few subdivisions of the great land grants. Note the real homelikeness of the fruit-surrounded houses here and wonder why the rest of the valley is not settled likewise. Visit the Metz

(Continued on page 424.)

Some of the typical industries of historic Monterey county. The upper pictures shows a grain-threshing outfit in action; the middle, one of the Spreckels sugar mills; and the lower is a good picture of a fine herd of dairy cattle near Gonzales.

horticultural commissioner two years ago reported over 300,000 apple trees alone. Apricots, prunes, cherries, figs, olives, pears, almonds, walnuts, and peaches are listed in important quantities. All of these and others have proved adapted to various parts of the Valley, as evidenced by the family orchards of early settlers and more recent commercial plantings. The figures in this paragraph are only approximations deducted from the estimates of many of the best posted people.

Why So Long Undeveloped?

Why has a county of such varied and boundless possibilities, such fer-

to tenants. They lived in affluence on very small net returns per acre from their great acreages. Why should they worry about intensive farming? Why dispose of their lands to settlers or undertake the cares of many tenants? Why should the tenants work along lines of permanent agriculture? The giant was bound by fetters of large land holdings.

The Giant Shows His Mettle.

But we said that he is now shaking off the shackles. What are the evidences of this? Go to the great plains around Salinas and toward Monterey Bay. Dotted with prosperous farmsteads they are, though, still

WHY IS THE FARMER SAD?

FARMERS have been so mercilessly battered back and forth between price-fixers, production exporters and consumers that they do not know whether they, as a class, are self-sacrificing patriots or greedy profiteers. They know individually, of course, that they have been working and worrying very hard during the last few years, and have produced more stuff than they ever did before, and they also know that it has cost them more for labor and for all other agencies and supplies which they use in production, than ever before. They also know individually, and to the extent of their personal acquaintance, that they not only do not get the prices which popular report charges to them—also that in many cases they have had to sell produce at less than it cost them, or, perhaps, have not been able to sell at all. Still there has been so much hubbub about high prices for farm products, and so many charges made that farming is the greatest money-making business that many farmers, as individuals or in local groups, have felt impelled to believe that perhaps only they and their friends have had particularly bad hands dealt to them and that probably all other kinds of farmers are rolling in ill-gotten wealth. As each group is apt to think this of all other groups of food-producers, the general condition of all must be seen to be one of doubt, distrust, apprehension of danger, and loss of incentive to vigorous and efficient effort for the production, of which all authorities declare the world is now in serious need. And this general condition is aggravated by the popular hullabaloo that food prices must be brought down—which means to the farmer that he will get less, because every handler will take out all he can from the final selling price and hand to the farmer whatever happens to be left—if there is any such thing.

COST OF PRODUCTION ONLY SURE BASIS

We have frequently claimed that the only way to keep farmers at work with their muscle and their invested capital is to make it sure that they will receive back all wise and economical outlay they make to get a product and fair compensation for their own effort and the use of their own capital in getting it. It is obvious that otherwise production cannot continue. The reason for recalling such generalizations now is that the wisdom involved in them seems to be taking concrete form and may be recognized in public policy. In Cleveland, Ohio, recently a special grand jury was appointed by the court to take up warfare against profiteering—of which David Gibson was foreman. A report was unanimously adopted by the jury which is full of sound economics. It proposes the creation of a commission of experts to determine base costs of all commodities so that there would be a foundation upon which the building of proper cost to consumer could be erected by adding proper cost of all proper handling. We have, however, only to do with the grand jury's attitude toward farming. It is this:

This investigation would not be for the purpose of exposing the farmer as a profiteer; it might even be found by this commission that the farmer was not receiving enough profit. Let this investigation be entirely friendly to the farmer.

It is our judgment that such a survey would not only reveal where the production could be increased at less cost to the farmer, but that it would directly reveal the true points of attack on the game of profiteering, by the simple process of subtracting the base cost from the price to the final consumer.

It is high time that the farming industry be viewed with a fresh industrial eye, one that is not obsessed with the present traditions of farming. Such a fresh eye might reveal why the farming industry has not been developed in proportion to other industries.

Yes, if the farmer is charged less by everybody else, he can produce for less, and that seems to be the grand jury's sound judgment of the situation. Of course, it must not be inferred that this grand jury has an idea that it is easy to determine the cost of a farm crop, but qualified economic investigators can determine it to the extent of a normal cost and price the factors entering into it in such a way that with their rise and fall just figures for base cost may be closely adjusted and the farmer's "relative justice be secured"—a thing which he is generally denied.

THE FRESH EYE ON FARMING.

Mr. Gibson has surely given us a picturesque phrase expressing a most significant truth. We have heard manifold exhortation during recent years of the need of a fresh eye in farming—that is, the need that the farmer should be taught to see how he can produce more with the same land, etc., and thus, presumably, be able to sell for less and still make a living. This is about all that the public mind will concede to be the farmers' right, although no fraction of this public mind would concede that such is its own right. We have had quite enough exhortation and explanation of how the farmer can produce more cheaply and therefore sell for less—nearly all of which is a guide-board to the poor-house for him. It is not a "fresh eye in farming," but a "fresh eye on farming," which this grand jury calls for. It calls for "a fresh industrial eye by which the farming industry shall be viewed." That is exactly what is needed. The eye not "obsessed by the present traditions of farming" is an eye which will no longer look upon the farmer as a man to be universally imposed upon—for the traditions of farming are that the farmer is a producer against whom finance, commerce, manufacture, transportation and labor shall charge the last cent the traffic will bear: that is, shall lay upon him every burden he can stagger along with and shall take from him everything except the bare necessities of life and leave as few as possible of them. Yes, we surely do need "a fresh eye on farming," and, judging by the parties who have held the old eye on farming, a grand jury is the proper source of such an indictment as is now found and filed.

A NEW GAME OF "PUBLICITY."

The plan of the Cleveland "special grand jury" seems to be to stop profiteering by placarding the "base-cost" of all commodities in places where these commodities are offered for sale to consumers. This will give all purchasers munitions for drives on retailers, and if consumers do their duty to themselves they will rattle these base-prices into the ears of the retailers until they put down their retail prices or put up their shutters. This base-price business is a great improvement on the proposition which requires a retailer to post the prices he himself actually pays for the goods he is selling, because the base-price uncovers all the middlemen who work between the retailer and the producer, and will give to the final distributor who, so far as practicable, buys directly from producers the advantage which properly belongs to him. He can undersell all retailers who buy indirectly, as he properly should.

But base-price posting does another thing which is even more important, viz.: it makes it exceedingly dangerous to speculate, because it will show the consumer when the speculator is robbing him and he will refuse to stand for it and will deny himself even his pet tastes by boycotting things which show speculators' inflation. For the retailer,

when posting the base-cost which the Cleveland grand jury proposes to require will protect himself by posting also the price which he has to pay for the goods he is offering. We can think of no way to turn "pitiless publicity" upon this great iniquity of robbing consumers by exactions after the producer gets his pittance doled out to him. It will no longer be a matter of "addition, division and silence." Every bright school teacher will send his students in arithmetic to the village store to work out "sums" all the way from addition to percentage from the storekeepers' price placards, and the whole community will hum with publicity. In fact, the many interesting things which can be done with these price-cards in a mathematical way will constitute the most popular parlor-game in every neighborhood, and while the kids operate mathematically the grown-ups will be kept busy also in drawing the moral conclusions and the local preacher will be quick to catch on with a burning sermon on the eighth commandment!

ONLY ONE GAMBLE IN A CROP!

By every moral and humane consideration there should be only one gamble in a food-product, and that is, the unavoidable risk which the man takes who grows it. No matter how good the land, the seed, the cultivation, the grower may make a drive at a crop with his full strength and wisdom and get nothing. The heavens above, the air around, and the earth beneath him are always full of destructive agencies and conditions which he will often be unable to avert or control. The farmer is therefore necessarily a gambler, and the only one admissible in the cycle which begins with the opening of the soil with the plow and ends with the opening of the consumer's jaws with interior yearning for nourishment. All the gamblers, small and great, who beset the many turns in this cycle should be cast out of it. There are, of course, many legitimate things which may need to be done in the accumulation, transportation and storage of foods, and whoever uses his time and money in such necessary service is entitled to reasonable reward for both, but such services are legitimate trade—not gambling and the inscription of such charges on the price-cards would create no sensations.

As for the risk of the only permissible gambler, the man who undertakes to grow the crop, it would of course, be covered in the base-price, which any group of expert economists would fix, as implied by the Cleveland grand jury in its suggestion of a "commission" to determine base prices. This would not remove risk from farming, for that is impossible, but it would, in the long run, qualify the thrifty and provident farmer to sustain his unavoidable losses by his own reasonable fore-handedness. In this way the whole consuming interest would insure its own continuous supply by contributing infinitesimally to the building up of a dependable farming business instead of contributing outrageously as it now does to the enrichment of idlers who spend their time in producing nothing but in figuring, figuring, figuring—all the way from the polished marble of the "exchange" floors to the mire of the curbstones. Yes, as the Cleveland grand jury claims, the determination of a fair base-price and the publicity thereof would "reveal the points of attack on the game of profiteering." And it is true, also, that the fact that this has not been done hitherto "might reveal why the farming industry has not been developed in proportion to other industries." It not only might; it would reveal it. Senator Borah, in a picturesque western way, said, the other day: "President Wilson lost his fourteen points in Europe because he 'sat in another man's game.'" Opinions may differ as to that, but there is no doubt that is just what the American farmer has always been doing and his business "has not developed in proportion to other industries," because he has been sitting in other men's games!

PASSING THE BUCK.

Current reports of meetings of associations of grocers indicate that these wide-awake tradesmen are endeavoring to parry charges of profiteering which some one is laying against them by counter-charges of profiteering against California co-operative organizations of food-product growers. So far,

It appears to be a process of back-firing, which has only added to the scorching of the groceryman who resorted to it. Colonel Weinstock, who is charged by law with the promotion of growers' selling organizations, has written to the secretary of an association which proposed to boycott the products of associated growers, a statement which is outlined in this way:

The State Market Director denies that rice, almond and other growers are about to announce excessive prices. He declares the increase of prices of organized products has been 15.7 per cent, while the unorganized products of the State have advanced 26.44 per cent in two years.

He denies that the California Rice Growers' Association has announced an opening price of from \$6.50 to \$7.50 this year, as against \$4.32 for paddy rice last year. He says the institution contemplates a wide advertising campaign to stimulate consumption, and it would be foolish to raise prices at this time.

Similar denials are made in the cases of prunes and almonds; of the latter an increase of about 3 cents a pound, which is absorbed by the increased cost of production.

Charges similar to those made by the retail grocers were investigated during the last session of the Legislature and found untrue. The organized growers want only their cost plus a reasonable profit, and that under the organized system the farmer receives his full share of the consumer's dollar.

It will probably surprise these retailers to hear that products of unorganized producers have advanced more than those which have organized producers to promote them. Their first thought will probably be that it is incredible that growers would organize to take less for their products. Well, of course, they do not—so that strain upon credulity need not be suffered. The fact is, of course, that profiteering by extortion or by speculation is practically ruled out in those products which are controlled by a producers' association. They have a base-cost fixed by the association, and every knows it, and it operates just as the Cleveland grand jury says it will—by "revealing the points of attack on the game of profiteering" so clearly that nobody dares to take a hand in that game with those products. With the other food products there is no such revelation of cost and profiteers gamble in them as freely and gaily as gambol the lambs in the spring time. Of course, Col. Weinstock does not say that growers of these unorganized products have enjoyed an advance of 26 per cent while associated growers have only secured 15 per cent advance. Oh, no! Sometimes an outside grower gets more than the base-cost, or fixed price, to members of organizations—for reasons best known to the profiteers who pay it, but the increased price which the retailers pay for such articles goes, not to the growers, but to the middlemen and speculators. This fact suggests two reflections: first, instead of boycotting the output of associations, the retailers should boycott products not certified and freed from speculation by them; second, our current experience furnishes a unique demonstration that the indictment of profiteering by the Cleveland grand jury is a true bill.

BASE-COST AND DAIRY PEACE.

If we had this base-cost proposition in working order we might avoid the unfortunate issue which is now being made against one of our largest and most necessary producers' organizations—the Milk Producers' Association. This association, which includes a large fraction of our dairy producers, simply desires to secure base-cost, which is understood to mean return of all actual outlay and a fair producers' profit. A few weeks ago certain tumultuous consumers' leaders raised a ruction against the Milk Producers, and they appealed to a group of advisory experts whom everybody respects for expertness and disinterestedness, and their decision was that the Milk Producers' prices were reasonable. As this decision has no constituted authority back of it, as the Cleveland grand jury contemplates providing for its base-cost determination, the combative consumers convinced the State Attorney-General that the Milk Producers ought to be proceeded against as a trust and suits were started in that direction last week. The Milk Producers appealed for support to other producers' organizations and a meeting of their representatives was held in this city on Monday of this week, and it is reported that at that meeting the other

associations decided that as the Milk Producers had not adopted the same form of organization that they had, they could not join with it in defending itself against the action of the attorney-general and so endanger the different form of organization with which they were successfully proceeding. The decision seems to have been that it is up to the Milk Producers to make their own fight for the kind of association they have organized. In our earlier references to this undertaking of the milk producers to get together we expressed the opinion that it had the form of a trust, and in some respects it had acted like a trust—both toward its own membership and toward other producers. For the good of everybody, perhaps, it is desirable that the courts should decide whether it is heading in the right direction or not. If it is, trials will strengthen it; if it is not, the sooner it is turned about and reorganized on a legal basis, the better. Apparently it is now organized to give a profit to other people than cow-men, while our other co-operative organizations work for their producing membership only. Otherwise than in this one regard, the Milk Producers may be like these other organizations, and if it had not been for this departure from the non-profit plan, which they regard as the basis of their strength and innocence, these other organizations would have responded to their appeal for help. This vexed question should be settled as soon as possible, for the dairy-men surely need organization to secure base-cost for themselves more sorely than any other group of producers.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Re-Planting Orchard.

To the Editor: I have an acre and a half of ten-year-old apple trees that I am going to take out to plant prune trees. Would it be advisable to reset the prune trees this spring or give the soil a rest for a year?—A. R., Morganhill.

You do not need to wait. Grub or blow out the old trees and plow the land as deeply as you can, pulling out all old roots. Get at this immediately so the generous rains (which the prophets say we shall have this fall) will have a chance to settle the soil. Lay out the new rows midway between the old ones, plant as early in the winter as the soil gets wet clear down, but is not holding cold water.

Green Feed for Brood Sows.

To the Editor: I have the use of seven brood sows. Have no alfalfa pasture. What feeds (roughage) can I grow for them?—A. W., Oroville.

You can get fine winter feed by sowing oats or rye with vetches, and if you have water to wet down the ground do it as soon as you can and then plow and harrow or drill in the seed without farther delay. If you are going to have water next summer, add some common red clover to your seedling now and it will fix you for feeding after you have mown off the grain and vetches during the winter. Red clover does admirably in the foothills if it gets its drinks regularly.

Don't Make a Fowl Work Too Hard.

To the Editor: If a food is deficient in protein can the fowl use carbohydrates, or fat, as a substitute to build muscle? If a food is deficient in ash can a fowl use carbohydrates, fat or protein as a substitute to make bone?—F. C. H., San Francisco.

In your carbohydrate food there is nothing by which it can supply its own deficiency in protein. It is hardly conceivable that you can find a food containing carbohydrates fat and protein in which they are not associated with lime enough to enable a fowl to stump along, but if you wish the bird to fly or run swiftly in production be sure to add bone-making materials. Profitable production is not a question of keeping alive.

Cover Crop in Prune Orchard.

To the Editor: The former owner of a prune orchard I have bought planted vetch as a green manure crop for the past two years, securing a good stand two or three feet high. I plan to plant melilotus indica and he has advised me to drill it in after irrigating the orchard, the latter part of

October or nearly in November. Do you consider this the best way? Would you advise inoculation of the seed? Would you recommend mixing in any other seed, such as bur clover, for the purpose of opening the soil with its longer roots? The trees are seventeen years old, are in fine condition, and I want to do all I can to keep them so.—H. W. S., Oakland.

Your predecessor gives you good advice. The way to get a good stand of melilotus is to get the seed in early so that the plant can make growth from the autumn heat—when there is moisture present to enable it to do so and that you make sure by irrigation. We apprehend that inoculating seed for ground which has grown such legumes as you mention is not necessary, though it would be enterprising to inoculate part of the seed and mark where you sow it and test out the matter by comparison of the growth of treated and untreated seed. It would make you surer of stuff to plow in under if you sowed some bur clover with the melilotus, but not for the purpose of getting longer or larger roots, for melilotus roots are much larger and longer than bur clover roots.

The Peach-Almond.

To the Editor: Two years ago, in the lower San Joaquin Valley, I observed an old neglected orchard of peaches, almonds, plums, pears, etc., on semi-adobe land. The peach trees were grown out of reach, scale eaten, some overloaded with "marbles," others with no fruit. The almond trees and some of the plums had been cleaned with red spider, but what attracted my particular attention was the large spreading branches—all in good foliage, thrifty, green—of what, on investigation proved to be a peach almond loaded with nuts and coming to normal maturity in the latter part of July. There was no sign of red spider, nor of the hard usage the surrounding trees gave evidence of—branches spreading in a radius of 15 to 20 feet and all in good foliage, gave evidence of unusual vigor and hardihood. It occurred to me that this must be a good root stock to employ in stead of peach or bitter almond root. I have since asked a number of nurserymen, but none of them seem to know anything about the adaptability of a peach-almond as a root stock. Will you furnish the information?—J. E. Bergtholdt, Newcastle.

Your nurserymen-counsellors are too young. They do not know as much as their grandfathers did. French and English gardeners knew the peach-almond and grew it largely as a curiosity. It appeared very early in California, which was reasonable as the pioneers grew their first peach trees from pits, which it was so easy to bring with them or to get by mail. They also planted almonds very early and either by local crossing of the two or because the peach is naturally sportive in that direction, peach-almond trees appeared in several places at about the same time and their possible value as a stock for the peach was a pioneer conception. W. B. West grew peach-almond seedlings at Stockton in the '50s, budded peaches on them, and secured what he described as "good trees." He stated that the peach-almond appeared in his nursery as a "chance seedling." About a decade later Senator Routier of Sacramento county was an earnest advocate of the peach-almond root for all peach propagation claiming that his use of it gave him "peach trees having smooth, straight stems and fine, spreading tops." But though freely advocated it was not largely used, probably because peach seedlings were easier to get and were so good. During the '70s and '80s the peach almond was always mentioned in peach discussions, but was never largely used. In the '90s Mr. Burbank produced a peach-almond by crossing the Wager peach with almond pollen. Thus, although the peach-almond is a very old novelty it is still up to you to demonstrate its value. So far as we know the prospect of success with it is just as good as it ever was.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending September 23, 1919.

Stations—	Past Week	Rainfall		Temperature	
		To Date	Normal	Highest	Lowest
Eureka00	.81	.91	66	48
Red Bluff00	.48	.46	100	58

Los Angeles Implement and Tractor Exhibit

Written for Pacific Rural Press by R. E. Hodges.

"What proportion of ranchers already believe in tractor farming?" we recently asked a great many tractor salesmen individually, knowing that they had been "talking tractor" to many more ranchers than we had.

The answers were astonishing, not only in the percentages named, but also in the uniformity with which approximately the same percentage was named.

If we are to judge by these answers, over 90 per cent of ranchers believe in tractor farming wherever enough land is being worked to require more than two horses. There are good reasons and poor reasons why some of them have not yet bought tractors. The chief reasons perhaps are difficulty in disposing of draft stock without sacrifice and in obtaining capital enough to buy tractors.

Visitors Interested in Details.

The writer's observations at all the tractor and implement demonstrations and shows held in California, including the one at Los Angeles, Sept. 16 to 21, 1919, indicate a notable change in the attitude and interest of ranchers which seems to bear out what the dealers told me as quoted above.

That the idea of tractor farming and its economy as compared with horses need no longer be proved to ranchers of California seems shown partly by the light attendance at the Sacramento and Los Angeles demonstrations and partly by the location of the scattered crowds at Los Angeles.

Never before have we seen so few people following the tractors to see whether they could plow or not. Never have we seen so great a proportion of the spectators collected around the headquarters tents of the various tractors and implements. Their object in being there was shown by the questions asked and answered, not as to how many plows a tractor would pull, but as to what kind of material the various parts were made of, how to get inside of the machines, how many grease cups, what sort of ignition, how dust was kept out of the engine, what principles made the carbureters burn low grade oils most thoroughly, and other details of construction as numerous as there are. One salesman remarked that you can't evade a farmer's questions now by changing the subject as you could a year or two ago. He knows what he wants to find out and he is there to find it out. He knows he is entitled to the information before the salesman is entitled to ask for his money.

Most Businesslike Demonstration.

The Los Angeles tractor and implement demonstration of 1919 was not the biggest ever held, but it was perhaps the best in view of preparedness and completeness of detail in every exhibit. Not so many different makes of tractors were there as were shown at the State Fair or some previous demonstrations. But a saner idea animated the exhibitors in that fewer machines were tormented by overloads, fewer useless stunts were performed, and attention was devoted to real business.

The crowds were not so great as at some previous demonstrations; but it was noticeable that a large majority of the visitors were intelligently interested in tractors and implements. The weather could not have been improved, and the dry adobe soil was not so badly cemented as the soils of many previous demonstrations.

Arrangements for convenience of visitors were the best we have seen at a demonstration except for the effort required to eat at the cafeteria after seeing its kitchen and kitchen inmates. The drives were sprinkled, and automobiles were freely allowed everywhere. A free parking space adequately watched and with each machine checked in and out was well patronized. Shavings and chairs and plenty of drinking water made all tents comfortable.

Each Tractor Exhibit Separate.

Each tractor had its own tent on its own proportional acreage, and it per-

Airplane photo of part of the Los Angeles Tractor and Implement Demonstration field. Implement and accessory tents are most prominent, tractor tents generally being out on the fields not pictured here. Photo by Hughes.

formed whatever operations were desired.

Two tractors were shown which are rated around two horsepower on the drawbar and about four on the motor. At least two were shown with 75 horsepower on the motor. Twenty-seven different makes were on exhibition, twenty-six of which were in working clothes at honest labor. Each

make of tractor was represented by the largest number of individual machines on the average that ever graced a demonstration.

Best Implement Demonstration Ever Held.

The greatest farm implement show ever staged in California was that at the Los Angeles 1919 demonstration.

More individual houses showed great collections, and these included more complete lines for every farm operation than were ever shown before on one field. More new features and improvements were brought to notice at this demonstration than at any previously held.

Half a dozen great tents housed implements and accessories, several of them including tractors doing belt work on various grinders, alfalfa cutters, silage cutters, hay presses, corn shellers, etc.

On the fields, a multitude of every kind of implements lost paint and proved merits. Everything from plows and surface mulchers to deep subsoilers and compressed-air land levelers saw service behind the flocks of tractors. Orchard cultivation was emphasized in most cases. Eight or ten of the outfits had set out trees or stakes or posts at regular orchard distances and had worked down the hard adobe clods in some instances to a real soft dust mulch close to the trees and all around them.

The biggest crowds seen consistently following any one tillage implement, however, were those watching the big subsoilers in action. It seemed that this phase of farming engages an increased amount of ranchers' interest since it is acknowledged that power is now available to pull deep tillage implements.

Get The Best

ASK the driver of an automobile stage running to the deer country what is his choice in a rifle and ammunition. If he hunts, he is almost sure to say Remington UMC. No one is better able to appreciate the best.

Modern minded, well informed sportsmen the world over have come to depend upon Remington UMC for the most important improvements in their shooting equipment. No other manufacturer so completely justifies this confidence with modern service.

In hunting rifles, the highest efficiency is reached in the Remington UMC lock-breech autoloading and slide action repeaters—hammerless, side ejecting and fitted with safety lock. In cartridges, in the Remington UMC rimless high power .25 .30, .32 and .35 for these rifles.

Remington UMC rifles and ammunition of identical design, along with the other Remington UMC products, were awarded the Grand Prize gold medal, highest honor "for modern firearms and ammunition," at the Panama-Pacific Exposition in San Francisco in 1916.

There are now more than 82,700 Remington UMC dealers in the United States—another important point of value in Remington UMC Service.

Conditions Facing Wine Grape Growers

(Written for Pacific Rural Press by Jno. J. Fox.)

At a meeting of grape growers convened for the purpose September 13 in the auditorium at the University Agricultural College at Davis by Geo. H. Hecke, Director of the State Board of Agriculture, the chief speaker of the afternoon was E. M. Sheehan, for many years Secretary of the State Board of Viticulture. His subject was that set forth at the head of this article, and gave a brief survey of the situation for wine and table grape men, as it generally stands today and the outlook for the future. He said in effect: "We have to face trying times for the next two months. We have a crop of wine grapes this year in excess of 400,000 tons. Formerly we knew what to do to take care of them. New conditions have arisen with National Prohibition and with the war-time provisional measure. No wine making means that all growers are looking for an outlet for grapes that have cost them twice as much to produce as it cost them four years ago."

Car Shortage Serious.

Some weeks ago, at the behest of the traffic departments of the transportation companies, I tried to estimate the tonnage of fresh wine grapes to be moved out of the State. After deducting the amount to be dried, or crushed for grape juice and grape syrup, I estimated there would be about 225,000 tons to be shipped equalling 15,000 to 16,000 carloads, in addition to some 16,000 carloads of table grapes. Our committee, working with the State Market Director, was told there was little prospect of 32,000 cars for grapes only. No further estimate could be given than possibly 300 cars a day for the State. And this for apples and other commodities that must be moved too. We could not get a line on grape cars at all. Now the supply of cars is entirely inadequate, and we can see no relief for at least two weeks, when some measure of relief may be hoped for. Not one quarter of the cars needed at Lodi are being supplied.

What Are the Needs?

Thirty-two thousand cars of grapes means that we need 500 cars a day for 60 days. They can't be supplied—nor half of them. Perhaps we won't get one-third of our needs. We were informed that no distinction would be made between accepting wine grapes or table grapes for car applicants. Also, if big packers wanted, say 50 cars, and small men only one or two cars, the small men will get equally good service.

Strange Conditions.

The endeavor to amend the Prohibition enforcement bill by permitting light wines to be consumed in the home brought forth a vague, indefinite reply. Many people figured they could make their own wine in their homes for home consumption, and orders for our wine grape began to pour in. This question is in doubt. No permission can be given. At present it seems to be against the law to make wine any time, anywhere for any purpose. The hope still exists that no interference will take place in home affairs.

Grape Juice from Lodi Grapes.

The Lodi wine-grape growers have been lucky. Fourteen thousand tons of wine grapes have been bought here by one firm. This will make 2,250,000 gallons of grape juice to be held for wine making, if practicable. Sulphurous acid is added (5 gallons to 100) to save it. This same grape juice is being offered at \$42.50 a barrel in New York, and lots of it is being sold. It is marketed as grape juice, to be later made into wine, after driving out the sulphurous acid. Our grape juice is not wanted without the skin of our grapes to give color or blend with Eastern.

What Are Our Outlets?

The best practical outlet for our wine grapes is through drying—if we can find a market for such raisins. Col. Weinstock has already busied himself in many foreign countries to this end. In a few months data will

be forthcoming with regard to this. There is a large domestic consumption now—a greater demand than ever for these dried grapes. No one need take less than 10 cents a pound for either dried white or black grapes. This method would also be a happy solution of the car problem.

Use Every Possible Outlet.

The advice of the old members of the Viticultural Commission to the grower is to use every possible outlet to save your crops where they cannot be sold or transported. If you can make unfermented grape juice—try that. If you can sell green and get transportation, do it. If you can dry your grapes, dry them or make into wine to hold them if you want to, however it may be handled later.

If you have contracted your grapes and they are ready for shipment but are held up for lack of transportation, you can salvage them in any way. The risk is yours. If a winery is operating the owner can crush your grapes

PROPERLY HOUSE YOUR TOOLS AND MACHINERY.

The present high cost of lumber should not deter us from building that machine shed or keeping the old one in thorough repair. It costs a lot of money these days to replace farm machinery and tools. For \$300 we can put up a shed that will hold the prune-dipper, tractor and cultivating tools, a truck and all the boxes for a small prune orchard—five or six hundred—and still have a good space to work in. A gravel floor is plenty good enough.

and take a chance on so many gallons per ton, or you can sell them to him outright. Syrup is not yet being made in large quantities, as there is no avenue of consumption yet in sight.

How Many Are Dried?

The tonnage to be dried will not exceed 10 per cent of the crop this year. About 25 efficient evaporators will try drying in Mendocino county this year. If dews or rains come some are going to try drying in the hop-kilns. A drier of grapes takes many chances without a proper evaporator.

A Good Market.

As to the possibility of selling grapes in the East, there are more purchasers than sellers. Fifty dollars a ton is being paid and lugs fur-

nished. This nets the shipper from \$35 to \$37 a ton with the price well guaranteed. One hundred dollars is paid down when the car is loaded and the remainder can be obtained at your bank on the bill of lading. Just ship and get your money.

Elements of Chance.

The elements of chance are lug boxes and cars. You might get boxes and no cars to ship them in, but boxes, too, are hard to get. There is plenty of sawed veneer, ends and cleats, but cars are short. The cost of boxes has risen from 8 cents to 20 cents in the last few months. Fifteen cents is too much. They were 17 cents yesterday. However, a few weeks may see them possibly down to 12½ cents.

OUR VICTORY MODEL

A 16-Year Development
With Over 100 Improvements

Built to Stay New

THIS new Mitchell is a new-type Six, built to keep its newness. We knew the requirements, for we pioneered the Light Six. We have built tens of thousands of them, and for many a year we have watched their performance.

Those years convinced us that the Light Six should be more enduring. So late in 1916 we started to revise it, part by part. For two years, scores of specialists and experts have worked here to that end. And this new model, with its 100 improvements, shows the complete result.

For Your Economy

Thus, in 100 ways, we have added strength and endurance, lasting smoothness, freedom from trouble. We have built a car which stays new, both in looks and in performance. We have cut your cost of upkeep and your operating cost. We have eliminated scores of shortcomings which Sixes of the old type have developed.

We have done all this at modest cost, through wonderful factory efficiency. We build the complete car—motor, chassis and body—under scientific cost-reducing methods. We have kept this new-type in the old-type price class.

Ask for our new catalog. Get all the details. Then compare the old types with the new. Learn what these changes mean.

PURVIANCE ONE-MAN LEVELER

Rear View
(Patent Allowed)

At Last The Leveler You Have Been Looking For

The Purviance "One-Man" Leveler is built of high grade steel, yet is light in weight and draft. It is strong enough, however, to stand very hard usage.

The leveler consists of a blade with a wing on either side, while a one-piece axle running the full

length of the machine is supported by two strong wheels at each end of the leveler.

The pull of a tractor practically loads and dumps the leveler, due to the arrangement of the draft and axle. The position of operating lever can be changed to suit various styles of tractors.

PRICES

6 foot Purviance One-Man Leveler.....	\$190.00
7 foot Purviance One-Man Leveler.....	210.00
8 foot Purviance One-Man Leveler.....	230.00

All prices f. o. b. Factory, Stockton, California.

New Experimental Evaporator at Davis

(Written for Pacific Rural Press by Jno. J. Fox.)

Probably more interest is centered in dehydrators and evaporating plants this year than in all the ten preceding years put together. For the wine grape growers see in it their chief hope of salvation. Prune growers believe they can improve quality, increase space, and decrease labor expenses by its use, and many raisin grape growers think the same. Besides, it is an insurance against foul weather.

At a meeting at the University Farm at Davis on September 13, called by G. H. Hecke, State Director of Agriculture, a representative gathering of growers from many counties met to inaugurate the opening of the new experimental evaporator. Demonstrations were given of dipping and drying wine grapes.

Dean Hubert E. Van Norman, Vice-Director of the University Farm, said that when the problem of evaporation was presented by the growers, the University had no funds for this particular work. The State Commission of Viticulture came to the rescue, and their offering, supplemented by Department help, availed to install the present plant. No figures are at hand yet, as the plant is new, though a few weeks will furnish some facts for future development. As fast as the department has any information to give out it will be given. The experiments will be conducted by Professors Bioletti, Cruess and Christie.

Result of Co-operation.

Professor F. T. Bioletti (Viticulture) said that co-operation had been, in existence for several years between the University and the State Board of Viticulture, for which there were results to show in various ways for the disposal of the wine grapes. Several methods of dealing with them were tried out, but the best way at the pres-

returned over a chamber at the top to the furnace room by the action of the blast fan and used over again. Mr. Cruess said, however, that the drying was slowed up by this method, the difference being 75 hours for a charge at Fresno by this method and only 24 hours by discharging used air. This again was reduced to 8 hours by using lye to cut the grapes. We were shown samples of dried grapes cured in the small laboratory plant at the University.

The new plant is designed to vary heat conditions from 100 degrees to 200 degrees. The humidity can also be regulated by the return air chamber and by the use of the suction fan.

The Lye Dip.

The dipping apparatus is an ingenious contrivance to handle baskets for dipping in the lye solution first and clear water afterwards, whence it goes direct to the tray. Four tins of lye are used to 50 gallons of water, or twice as strong as is used for prunes. The prunes are dipped at the boiling point. This carries off bloom and slightly checks the skin. Thompson's Seedless require about 4 to 5 seconds immersion, while Muscats, being tougher skinned need perhaps 20 seconds, and Zinfandel 8 to 10 seconds. Some men dip Thompsons in Soda Bicarbonate, though this may not give such a rapid rate of drying.

This cut shows the new experimental evaporator at Davis. A dipping demonstration is taking place at the right. The concrete sulphur house is shown in the foreground and the concrete furnace building at the left showing oil blast burner. By courtesy of H. J. Baade, County Agent, Napa.

ARCADIAN Sulphate of Ammonia

In a great many cases an application of ARCADIAN Sulphate of Ammonia now will help size the coming citrus crop in addition to prompting bud growth for next season.

ARCADIAN Sulphate of Ammonia is for sale by: CALIFORNIA: San Francisco: Hawaiian Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Pacific Guano & Fertilizer Co., Western Meat Co., California Fertilizer Works. Los Angeles: Pacific Guano & Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Agricultural Chemical Works, Hauser Packing Co. OREGON: North Portland: Union Meat Co.

Do You Want \$100? Could You Use \$50? How About \$25?

Well then, put on your thinking cap and submit a name for our finest brand of California Canned Fruits. Remember, we are a co-operative growers' organization and we want a striking, distinctive, easily spoken, easily remembered name, which can be registered as a trade mark.

We are now operating three growers' canneries and expect to extend our operations into every part of California where the growers want to can their own fruit, and we intend to make our brand as famous as Sun-Maid on Raisins, Sun-Kist on Oranges or Sun-Sweet on Prunes.

For the best name selected we will pay \$100.

For the next best name (which we may use as a subsidiary brand) we will pay \$50.

For the third name we will pay \$25.

If two or more submit the same name, preference will be given to the one sending in the name first.

If interested in Co-operation, write us and we will tell you all about our \$400,000 canneries in San Jose, our plant in Tulare and our plans for further extensions all over California.

ADDRESS

California Co-operative Canneries
San Jose, California

ent time and demand seemed to be drying them. In the San Joaquin valley it is possible to dry the crop in the sun, using proper precautions, but in the upper and coast sections there is only one way—artificial evaporation. What kind of plant to use is the question. No evaporator has yet tried out in the coast counties for drying wine grapes, though a number have been built there both in Napa and Sonoma for prune drying.

Several processes have to be gone through. The grapes are dipped, rinsed and set on trays. Then they are probably sulphured. They may then be set in the sun for awhile and later evaporated. The whole course has yet to be worked out, and demonstrated for the most approved method.

Work So Far Preliminary.

Professor W. V. Cruess said the work to date was preliminary. He has studied commercial and practical dryers throughout the State in search of the right idea: a dryer that shall be easy to handle and not too expensive to build or to operate. He has seen dryers that have been installed costing from \$300 to \$50,000—a wide range. The latter was for drying capstem raisins and was a hot-air blast. The main defect was the length of tunnel, which was up to 75 feet. The owners advised cutting this length in half.

The Demonstration Plant.

The new plant is so constructed that the various methods now practised can be tried out. The end of the building is moulded to take in suction fan for carrying off moisture-laden air, if necessary. Or the heated air can be

Trays and Sulphuring.

The trays shown at Davis are half-inch mesh. Professor Cruess advises ¼-inch mesh to prevent loss of shattered grapes. The grapes are improved in color by sulphuring, even the red ones profiting thereby if needed for grape juice or wine-making. They are taken direct from the dipper to the sulphur house. Fifteen to 20 minutes of sulphuring is enough if they are evaporated afterwards, while 3 to 4 hours are needed if they are to be dried in the sun.

The Sulphur House.

The sulphur house is of reinforced concrete and will hold two cars of 60 trays of 30 pounds to the tray, or 1½ tons to a charge. A small adjustable vent is placed in the roof to assure complete combustion of the sulphur. The sulphur-pit is slightly offset to avoid burning of grapes. One of the problems is to determine length of time desirable in the house.

The Evaporator.

The evaporator is a tunnel 33 feet long, 6½ feet wide and 7 feet high, with a blast fan next the furnace room and a suction fan the other end. Either or both can be used. The amount of humidity desirable for various fruits has yet to be determined. Thermometers—read from the outside, are placed at three points, the hottest one being self-registering. The tunnel holds 8 cars. If laboratory tests can be duplicated here, a charge of grapes can be cured in from 12 to 15 hours. When the point of entry of heat registers 150 degrees, the other end of the tunnel only registers 100 degrees. (Continued on page 419.)

20 POT BULBS, 20c.

6 New Purity Freesias, 1 Babiana, 1 Eucharis, 1 Star Bethlehem, 1 Double Rosebud, 3 Buttercup, and 4 Grand Duchess Oxalis, and 1 set of New Winter-blooming Spencer Sweet Peas and Catemans, and all bloom this winter. ALL MAILED FOR 20 CENTS. CALIFORNIA ORCHARD MODEL

of the famous

Allwork Kerosene Tractor

Allwork II

12-22 h.p.—4x6 four cylinder motor—4000 lbs. weight and still only 50 inches wide, 55 inches high with a 75-inch wheel base and a remarkably short turning radius

PRICED to be the Greatest of All Tractor Values

All gears enclosed in a bath of oil.
Timken and Hyatt bearings throughout.
Rear axle differential.
Individual rear wheel brakes.

Kerosene or distillate burning engine.
High tension magneto.
Five bearing crankshaft.
Three speeds forward and one reverse.

Carefully working out every detail that is demanded by the orchardist and vineyardist of California, the old established Electric Wheel Company, Quincy, Illinois, announces the ALLWORK II Tractor built especially for California horticultural conditions and with specifications and performance that command the interest and attention of every producer of fruit.

The idea that has made this tractor so pre-eminent was the development of a very powerful engine in a short, low, easy turning tractor, giving the owner more power than he ever had before for the money, less load to bear down, more standard units and greater efficiency in a small working space especially around trees and vines. We want you to see this tractor and pass judgment upon it.

Dealers who are looking for a tractor highly desirable in the citrus and deciduous districts of California will find the ALLWORK II will sell readily and be a service and satisfaction to the owners.

Orchardists will find in the ALLWORK II many features that have not been included in any tractor yet offered. Write us for full descriptive literature.

Address

The **49^{er}** says—
"the genuine **GIANT**
dates back to
1866"

"I remember well when we used black powder for stump blasting and mining. Just after the Civil War the first Giant Powder ever made in the United States was manufactured in a little laboratory in what is now Golden Gate park.

"Out of that beginning has grown The Giant Powder Co., Con., with its chain of great plants and magazine stocks throughout the entire West. And the Giant Farm Powders are being used for stump blasting, boulder blasting, tree planting, etc., by thousands of Western land owners. Giant Powders have always been so popular that some people have thought any ordinary dynamite was Giant Powder, but that is wrong. The only way to get Giant economy and efficiency is to get the genuine Giant Powders made by the originators of the name.

Just tell us "send me your book," and we will mail you our valuable guide to blasting, "Better Farming with Giant Farm Powders."

STUMPING

EUREKA

Here and There in the Fruit Business

"Knocking Almonds."

The California Almond Growers' Exchange says: "A certain firm of speculators, who, we believe, are buying most of the almonds outside of the Association, say in a circular known as 'Brokers' Advice,' in part as follows: 'It is with pardonable pride that we call attention to the fact that, without exception up to date, our opening prices this year have been materially lower than those subsequently named by the different associations, and we know this is bound to aid our Brokers when they solicit business for our account after we have named prices for 1920 crop next spring.' See? They can sell at lower prices than the association pays and still make a profit out of your almonds and you can't blame them—that's good business. They are so sure of you that they can name prices for your nuts in the spring before the shell has formed. Is this speculation or betting on a sure thing?"

Apricots Dried Light.

We have heard quite a few complaints of apricots drying out light this year, and apparently it was quite general in the north. Percy R. Dexter of Gilroy said that his Moorpark dried away 5 to 1 this year. F. B. Smith of Saratoga told us his Blenheim dried out 6-1, and W. H. Schrader of Los Gatos also had 6-1 results. A. C. Kuhn of Evergreen kept account of his fruit from young orchards. He said, "The shrinkage on my apricots was 5% to 1. In these figures we averaged the boxes of fruit at 40 pounds, which I believe was right, though we did not weigh every box."

It is difficult to account for this condition except that the weather was very generally cool during the ripening period, except at Mr. Dexter's. It may possibly have been that the fruit was picked a little too close on account of the high price of labor. But with green fruit at \$100 to \$110 a ton this year, it would have paid better to ship to a cannery than have that much shrinkage.

An Eight-Hour Day for the Farmer?

"Say, what's this talk about an eight-hour day for the farmer?" said a jolly looking grower at the State Fair to the writer. "If production is short now, how would the world fare if we fellows cut down our days to eight hours? It is production that is going to bring down the cost of living. We farmers mainly spend our earnings in efforts for reproduction, and all the hundreds of million of dollars we get for our products come back to the State and everyone that is a worker benefits. If the farmer makes money everybody gets a look in. For this money comes where there was none last year—from a new creation, so to speak. This year has shown better than ever before what our growers' organizations are worth. We have doubled some of our yields in ten years, and yet our stuff sells readily and is well distributed. Yes, I am going to buy me a tractor this year. Eight hours! Come and have a drink of buttermilk."

To Plant Figs at Oakdale.

200 acres have been bought by fig men from Fresno in the Leitch Colony, Oakdale (Stanislaus County), to be set out to Kadota figs. Another man from Orange Cove has bought 40 acres for the same purpose, and various others have bought in the last few months with an eye to figs. The bare land price is still around \$100 an acre. This section is already known as an almond producer.

"Constitutional" Wine.

Wine is to be manufactured at several large wineries in the State this year that will not be in contravention

of the Prohibition Act, according to word received by John B. Carter, Collector of Inland Revenue. The alcoholic content down to one-half of one per cent is extracted when the wine is ready for marketing. C. E. Pickett of Calistoga says it is not biblical because it "maketh not glad the heart of man," for even the color loses its roseate hue and becomes cloudy and uncertain. Perhaps that is why it is called "constitutional." To the layman's ear it sounds rather sombre and colorless. Captain Kidd's toast, as he lifted his beaker of grog, used to be, "Down with strong drink!" And that is what the government says.

The Loss on Cling Peaches.

There has been quite a loss in cling peaches for two reasons. One was unavoidable, and that was shortage of water in some quarters when it was needed to size up the fruit. The other reason was inadequate or no thinning of the peaches, and this will result in a loss of fruit which might otherwise have been marketable. It is true that labor was difficult to obtain when it was needed and prices for day labor were very high, but more thinning might have been done.

Kearney Figs Prospering.

Last year 3,000 border Adriatic fig trees on the noted Kearney ranch owned by the University of California, near Fresno, produced 120 tons of figs. Some of the land has been sold and the number of trees reduced by a few hundred, but the other trees are bearing a still larger crop than last year, needing heavy propping to save the branches.

Labor Organization in San Joaquin.

The large fruit centers have done admirable work in the matter of labor organization of the fruit harvests. Permanent plans to the end will doubtless supervene in view of the rapidly increasing demands of growers who will need importations annually, for years to come apparently, just during the harvest season.

Butte County Olives.

Our earlier estimates on olives are hardened. The crop in Butte county is reported 60 per cent of a crop or better than last year. The quality is excellent and the trees as usual in A-1 condition. Los Angeles county claims pretty well a normal crop of olives. The price of oil keeps the fruit high.

The California Peach Growers in Fresno have sent a letter to all members advising the drying of small clings whole. Realizing that canneries would run smaller this year they anticipate that the Association can market small peaches dried, and so allow the growers to realize on otherwise unmarketable fruit. The peaches are to be quartered, leaving the pit intact, sulphured generously and dried in the sun in the usual way.

Show up well and provision has been made to dry quite a tonnage of this crop for export, it is said. We know nothing of the markets for this dried product. Should markets develop for any material quantity of dried wine grapes, added interest will be shown in evaporators to handle the crop for storage. From 8 to 10 cents has been paid for the dried grapes. No estimate of the value of this crop can be given, though \$25 to \$55 has been paid green.

Shasta County's prune crop will amount to about 1200 tons according to Horticultural Commissioner B. F. Stroup, according to size, on the present basis, they should average \$280 a ton.

PAYS TO RAISE A COVER CROP OF BUR CLOVER SEED.

At 15 to 20 cents a pound why would it not pay to raise a crop of bur clover seed, which is always in demand for cover-cropping because it is such a sturdy and persistent grower? The threshed straw is mighty good feed, too. In order to make the bur clover stand up for cutting and harvesting from 15 to 30 pounds of grain might be sown with it.

Fruit

The Winchester Pattern. 320 pellets out of a possible 431, or 74% of the shot charge, evenly distributed; no birds get through

How big a bag will you bring back?

THE difference between a bulging bag and a lean one is often a question of gun and shells and not of shooting skill.

Make sure you have the right game-getting combination—shells that kill when the aim is true, and a gun that enables the shell to make its best pattern.

Good shell patterns are either *allowed* or *prevented* by the character of the gun barrel—the chamber, bore and choke.

Faulty chambering even more than faulty choking tends to mash and “ball” the shot, making pellets fall short or fly wide.

And if a gun is faulty in its most vital part, the chamber, the chances are that the bore is also carelessly made.

From chamber to choke, the barrels of the famous Winchester Repeaters are bored to make the shell throw its highest pattern. They are free from shot-jamming defects. They let the shell do its full work.

“Line” test the barrel

Point a Winchester barrel toward the light and look through the bore.

It looks like a highly polished mirror. Not a false shadow throughout the bore. Sight through the bore at a horizontal black line on the window. This line will throw a “V” shadow in the bore. Tilt the barrel till the point of the “V” touches

The “Line” test

Perfect bore of Winchester barrel revealed under “Line” test.

Irregularities revealed in inferior shotgun barrel under “Line” test.

the muzzle. The perfect “V” shows absence of irregularities.

This is the “Line” test of a perfect bore. No faulty barrel can pass this test—the “V” will be distorted.

What  means

This mark on a Winchester barrel means that the gun has passed the “Winchester Provisional and Definitive

Proof” test, having been fired many times for smooth action and accuracy, and strength-tested by firing 25 to 40 per cent excess loads. This stamp stands for Winchester’s guarantee of quality, with 50 years of the best gun-making reputation behind it.

Your dealer will show you Winchester Guns and Ammunition

Before you take to the woods this Fall, get your dealer to show you a Winchester Repeater—Model 97 for hammer action; Model 12 for hammerless. Put one to your shoulder, try its balance, see how beautifully it handles. Your sportsman’s instinct will tell you it’s the best weapon you could choose. Leading hardware and sporting goods dealers in every community carry Winchester Arms and Ammunition. They will be glad to assist you in selecting the gun best suited to your needs. Upon request, we will mail you, free of charge, the complete catalog of Winchester guns and loaded shells.

WINCHESTER REPEATING ARMS CO.
Dept. 151 New Haven Conn., U. S. A.

Important Notice

The chamber, bore and muzzle choke of all Winchester Shotguns are reamed to micrometer measurements for the particular Winchester Shells they are meant to shoot. You will get the highest and most uniform pattern results by shooting Winchester shells in Winchester guns. The two are made for each other.

Model 12. Hammerless take-down repeating shotgun. Made in 12 gauge, weight about 7½ lbs.; in 16 gauge, weight about 6 lbs.; in 20 gauge, weight about 6 lbs.—more popular with women and new shooters, because of its lightness and very slight recoil.

Model 97. Take-down repeating shotgun. Made in 12 gauge, weight about 7½ lbs.; in 16 gauge, weight about 7½ lbs. The favorite with shooters who prefer a slide forearm repeating shotgun with a hammer.

WINCHESTER

World Standard Guns and Ammunition

CAR SITUATION

Attitude of California Fruit Distributors

TO ALL MEMBERS:

Since the early part of the year, we have been continuously after the Railroad Administration to force complete recognition of the needs of the deciduous fruit industry for 1919, in the matter of transportation, car supply, schedules, etc. We have a number of times held a personal conference with the Director of Traffic at Washington, as well as other officers of the Railroad Administration and car lines.

We have exchanged telegrams and letters as follows:

Sacramento, California, September 16, 1919.

Sacramento, California, May 23rd, 1919.
Mr. W. G. Barnwell, Traffic Mgr., Atchison, Topeka & Santa Fe Railway, San Francisco, Cal.
Mr. G. W. Luce, Traffic Mgr., Southern Pacific Railway, San Francisco, Cal.
Dear Sirs:—During the war, the Railroads found it necessary to lengthen the time of hauling fruit across the Continent. Under pre-war conditions, we had an established service, wherein we could sell in New York the tenth morning, Chicago on the seventh morning. This schedule was changed by the Railroad Administration, so that during war times, we were supposed to get the fourteenth morning in New York, and the tenth morning sale in Chicago.

The war is over. We should go back to pre-war conditions. We ask for the establishment of the old schedules and running time to Chicago. Would request that you immediately arrange for such service.

Awaiting immediate advice, I remain, yours very truly, CHAS. E. VIRDEN, General Manager.

San Francisco, Cal., May 31, 1919.
Mr. Chas. E. Virden, General Manager, California Fruit Distributors, Sacramento, California.

Dear Sir:—Have just returned from Southern California and find awaiting me your letter of May 23rd, in matter of reinstatement of pre-war eastbound schedule for deciduous fruits.

Will bring the matter to the attention of the Administration and urge immediate disposition. Yours very truly, W. G. BARNWELL.

San Francisco, Calif., June 13th, 1919.
Mr. Chas. E. Virden, General Manager, California Fruit Distributors, Sacramento, California.
Dear Sir:—Referring to your favor of May 23rd concerning eastbound fruit train schedules:

This subject has been carefully considered by the Administration officials in Chicago as well as those on the Coast and the conclusion has been reached that the schedules adopted for movement of last season's traffic should not be disturbed, excepting that trains should be made up and moved as blocks of fruit are assembled, the same as in seasons previous to the last; this instead of confining the departure to certain hours of the day.

It is the understanding of the Administration that the manner in which last season's fruit was handled, both as to time in transit and particularly with reference to regularity and dependability of service, met with the approval of fruit shippers, they having so expressed themselves at the fruit meeting held at Sacramento, May 15th.

Considering the abnormally heavy traffic to move the coming season, our operating people tell us it will be absolutely necessary to secure out of locomotive power the very best possible performance if we expect to make deliveries on time, which we understand is more desirable in preference to an irregular performance by endeavoring to move a heavy crop on a faster schedule. Yours truly, G. W. LUCE, W. G. BARNWELL.

Sacramento, Calif., June 16, 1919.
Mr. G. W. Luce, F. T. M., Southern Pacific R. R., San Francisco, Calif.
Mr. W. G. Barnwell, A. F. T. M., Santa Fe Ry., San Francisco, Calif.
Gentlemen:—I am not satisfied with the reply that you made under date of the 13th, pertaining to reduction of schedules on eastbound fruit trains, you saying that at the meeting held in Sacramento on May 15th, the schedules met with the approval of the fruit shippers.

My notion of this meeting is that the Transcontinental schedules were not even discussed. This meeting was held for the purpose of discussing conditions within the state such as time of pulling trains and placing of empties, assembling, etc.

I am of the opinion that the 1919 perishable fruit movement throughout the United States is going to be the heaviest in the history of the industry, and it is going to tax to the utmost the railroads in the providing of refrigerator cars, as I think we all realize there has been practically no new refrigerators built in the past two years, and as far as I can learn there are none under construction at this time, and it must naturally follow that some of the service are in need of complete overhauling, etc.

Now it does seem to me that you can conserve traffic conditions and more fully protect the requirements of the growers and shippers by handling these trains under load in the quickest possible time. In other words, get back to pre-war schedule, or better, and a very definite effort should be made to have empty equipment returned promptly to producing fields. If these things are done it will result in a greatly increased availability of refrigerator cars and will also mean a considerable reduction in the amount of ice consumed in shipment under refrigeration, and we are told there is a short supply of ice.

I may be entirely wrong in the position I am taking, but I have yet to be shown.

Realizing as you gentlemen do the necessities of the California growers, I think you should urge the schedule that I proposed in my letter of May 23rd, and I ask that you give this your further and immediate consideration and let me have a reply.

Yours truly,

CHAS. E. VIRDEN, General Manager.

C/o Mr. J. H. Dyer.

Sacramento, California, July 23, 1919.
G. W. Luce, F. T. S. P. Railroad, San Francisco, California.
Mr. W. G. Barnwell, A. F. T. M. Sfe Railway, San Francisco, California.
See my letter June sixteenth asking for reduction in schedule across Continent which means a greater availability of refrigerator cars, material reduction in amount of ice consumed and greater efficiency in handling of this perishable industry. Stop. If nothing happens the movement from this state during month of August will be extremely heavy followed by like movements in September and possibly October. You realize that today there is not a surplus refrigerator car west of the Sierras. By this I mean we are practically using every car that is available from day to day. If there should be an interruption in the return of these empties we are going to suffer. There should be a seventy-two hour supply of empties at loading stations so if any delay to operations, wrecks, etc., should prevail it would not prevent us from loading. I again appeal to you for a reduction in schedule and would ask that you advise by wire whether or not you are going to take action on this request.

SM 11:25 a. m. W.U.

CHARLES E. VIRDEN.

Carbon copy of above telegram sent to J. H. Dyer, Gen'l Mgr. U. S. R. A., 11:25 a. m., July 28th, 1919.

San Francisco Calif., July 29, 1919.
Chas. E. Virden, Calif. Fruit Distrs., Sacramento, Calif.

Your wire twenty-eighth about re-establishing pre-war eastbound schedule deciduous fruit matter has been carefully considered with conclusion that no change will be made in present schedule, believing that all things considered present schedule will provide regular dependable service. Stop. Supply refrigerator cars being given closest attention with full realization that it is necessary to keep cars moving westward and every effort is being made to that end.

W. G. BARNWELL, July 30, 3 a. m.

Chas. E. Virden, Sacramento, Calif. San Francisco, Calif., July 29, 1919.

Your request for reduction eastbound schedule deciduous fruit has had very careful consideration by the Administration at different times from different angles since its receipt with the conclusion that no change will be made in present schedules, believing that after considering ice supply, reicing and car situation, also movement of fruit, that present schedule will render regular dependable service on the fruit. Stop Supply of refrigerator cars being given most vigorous attention with knowledge that it is necessary keep empty refrigerators moving westward, and every effort is being made to give adequate supply; and if any failure to do so, coupled with all that is being done for movement of fruit East and empties West, it is beyond prevention. Stop Further it is thought if reductions in schedules east made it would conflict with all factors entering into the service and retard movement west-bound of empties. Stop Viewing subject as an entirely stability of schedule eastbound and the facility of moving empties westbound are both promoted by present arrangement. Stop While few cars may make better than present schedule it is the entire movement of both fruit and empties that must be considered.

G. W. LUCE, 11:42 A.M.

C. E. Virden, Truckee, Calif., July 29, 1919.

Your telegram yesterday empty PFE cars receiving special train service from Ogden west just received advice that administration making arrangements move three thousand FGE cars to California just released from Georgia and Florida service. These cars now reaching Chicago in liberal numbers and expected move west average two hundred per day which with return empty FFE cars should give us approximately four hundred daily empty west through Ogden gateway.

J. H. DYER, 3:07 P. M.

Mr. Wm. Sproule, Director of Railroads, Sacramento, Cal., Aug. 5, 1919.

We are not obtaining sufficient cars to handle our business. For example, tomorrow the hill points and other additional districts around Sacramento will need hundred thirty-five cars and the Pacific Fruit Express tell us that the most they can hope to deliver will be sixty-five and they are not certain about this. Stop Something must be done and done quickly. A large tonnage yet to be moved and quick action is necessary. We appeal to you to take immediate steps to avoid the tremendous loss that will follow to the growers and shippers if equipment is not furnished.

CHAS. E. VIRDEN, 2:10 P. M. WU.

Chas. E. Virden, Sacramento, Calif. San Francisco, Cal., Aug. 5, 1919.

Wire date expect to place for loading seven a. m. tomorrow one hundred forty empty refrigerators in Sacramento territory. Will continue to do everything possible to protect loading.

WM. SPROULE, 11:30 P.M.

Mr. Edward Chambers, Director of Traffic, Washington, D. C. Sacramento, Calif., Sept. 5, 1919.

We are now meeting with serious car shortage with very little relief in sight, in fact our advice is to the effect that we may expect even greater shortage. Most of Tokay crop yet to move and considerable part of the table grapes in Fresno district yet to be shipped. While we have no way of checking we are told that movement of winegrape varieties is heavy. This you can probably verify from your Pacific Coast offices and as per our conversation consider that now is time to act so that table grape industry may be fully conserved. Would appreciate immediate answer.

CHAS. E. VIRDEN, 10:00 a. m.

C. E. Virden, Washington, D. C., Sept. 9, 1919.

Your fifth supply will appear serious for few days but as soon as results strike are overcome will be more regularity in movement. Am watching winegrape situation closely. Have no information yet that it is interfering in any serious way with shipments of table grapes or other fruits.

EDWARD CHAMBERS, 5:40 p. m.

Mr. Wm. Sproule, Director of Railroads, Sacramento, Calif., Sept. 11, 1919.

Car supply has been entirely inadequate and is now very critical. Will involve growers and shippers in tremendous losses with absolutely no one to blame except Railroads. Positive and drastic action should be taken this morning to relieve this situation. Stop Greater co-ordination should be immediately obtained. It is getting so we never know what to expect. This is a business that is deserving of the personal and effective attention of someone connected with the Railroad Administration.

CHAS. E. VIRDEN, 9:10 a. m.

Chas. E. Virden, California Fruit Distrs., Sacramento, Calif. San Francisco, Calif., Sept. 11, 1919.

Your message 11th received. Appreciate difficulties created by shortage of refrigerator car supply which efforts of all parties concerned have not been able to remedy because of large crop demands throughout United States in producing districts supply is improving and within forty-eight hours this improvement ought to be manifest. I have subject actively in hand both with Administration officers east and with refrigerator car lines since you tried to phone me have endeavored to reach you by phone but without success. You can rely on best being done that circumstances will allow.

WM. SPROULE, 1:43 P. M.

Mr. Edward Chambers, Director of Traffic, U. S. R. A. Washington, D. C. Sacramento, Calif., Sept. 11, 1919.

Something must be done immediately and executive action should be taken instantly towards furnishing cars to move grapes. Shortage is an extreme one. The present position is the most critical in the history of the industry. We appeal to you to take personal and forceful action. Answer fully.

CHAS. E. VIRDEN, 11:45 a. m. WU

Chas. E. Virden, Sacramento, Calif. Washington, D. C., Sept. 12, 1919.

Your yesterday careful survey of situation leads me to believe no serious car shortage will continue and that supply will improve daily. What has happened was anticipated as I advised you message a few days ago. Results of strike are about overcome. I am still looking into winegrape situation and will let you know result shortly.

EDWARD CHAMBERS, 12:01 P. M.

Respectfully submitted, **CHARLES E. VIRDEN, General Manager.**

THE NEW EXPERIMENTAL EVAPORATOR AT DAVIS.

(Continued from page 414.)

isters approximately 120 degrees, and the chain of cars is moved down and replenished from one end as fast as they are cured. A continuous run turns out from 5 to 5½ tons a day, it is estimated.

The temperature is very important, says Mr. Cruess. Grapes can stand up to 200 degrees when wet, but when dry not over 150 degrees, and even that tends to caramelize the grapes when they are very dry. The dryer the fruit the more susceptible it is to injury from heat.

Furnace Room.

The furnace room is of reinforced concrete with a floor 12 inches thick and 6 inch walls. An old boiler with the tubes taken out forms the heat chamber, ingeniously built in. There are two sets of heat blasts—one plain air and one forced air, both oil feeds. The roof is also concrete, with woven fence wire for reinforcement. The fresh air is regulated by doors, and the fan is closely set in a molded aperture. Waste of heated air is avoided to the greatest extent. The blower burner is operated by a 1/16 H. P. motor and burns stove distillate at a cost of 25 to 30 cents an hour. About 30 feet of 12-inch pipe is used for heating the air. The blast fan is operated by 7 H. P. motor, though a four is enough. It revolves at the rate of 300 revolutions a minute, conveying 300 cubic feet of air to the tunnel in that time.

Prof. Cruess probably knows more

about evaporation and has conducted more experiments than any man in the State. This fall we may expect results in experimental grape drying that will be conclusive. At any rate there will be something definite to go on—something workable.

HORTICULTURAL JOTTINGS.

The first carload of fresh wine grapes ever shipped out of Napa Valley was sent from St. Helena September 13.

The big wineries in both Napa and Sonoma Counties are crushing grapes, and a more hopeful feeling prevails in salvaging the crop.

Forty thousand acres of timberland and brush have been burned over in the Los Angeles National Forest, according to Supervisor R. H. Charlton, and the fire was still raging September 18.

An 80-acre crop of grapes has been sold at Tulare for \$25,000, picking and curing to be done by the purchaser. The owner gets \$312 per acre for his grapes without doing a tap—some record.

The Watsonville district, which produces half of the State apple crop, will ship approximately 3,000,000 boxes in 1919 as compared to 2,500,000 boxes in 1918, according to the Bureau of Crop Estimates.

A number of hop growers in the Sacramento valley have refused 57½ cents a pound for their 1919 crop, believing the price will go to 75 cents before the crop is cleaned up. Very few lots are left uncontracted for.

A delegation of deciduous and citrus fruit growers met with the director and staff of the State Board of Agriculture at Chico on September 16, to outline plans for the State Convention to be held there in November.

Because of the success which attended spraying orange groves in the late spring against orange thrips, many growers will practice the same treatment this fall to protect the new September growth. Lime-sulphur is used.

In carrying out the work of cantaloupe standardization under the law in Stanislaus county, Commissioner H. L. Rutherford condemned about 10,000 crates of green and sun-burned melons out of 300,000 crates shipped.

The California Wine Association is crushing grapes at its Napa winery for must or grape juice. The pasteurizer has only just been installed. The Association will probably crush all the grapes they can and ship any surplus to Winehaven.

It is estimated that 40 per cent of the State's peach crop is produced in Fresno, Kings and Tulare counties. The movement of fresh peaches from California by the Bureau of Crop Estimates is about 4,000 cars, the rest being canned and dried.

Dr. R. L. Nougaret has resigned his office with the Bureau of Entomology, U. S. Department of Agriculture, to take charge of the Viticultural Office of the new State Department of Agriculture, to which he was appointed by the Director.

The almond harvest is proceeding apace and the Almond Growers' Association is shipping them out as fast as they are delivered. Practically the entire crop has been sold. It is a booming year for almonds. Buyers bought while the buying was good. Why wait to buy from the scalpers?

The International Trade Conference to be held at Atlantic City, September 30, will be attended by delegates from all the great allied European powers. These will consist of officials and business men of the highest standing who can speak authoritatively for the most important divisions of their respective industries.

"Common vetch seed for cover crops will be sold at 12 cents a pound for delivery after October 15th," says the Bomberger Seed Co. of Modesto. Melilotus will be sold at 10 cents a pound in less than ton lots, or 9 cents in ton lots and over. There is very little burr clover to be had—apparently not near enough to meet the demand.

We Manufacture Levelers for Any Power from 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Frenos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws. Write AERMOTOR CO., 2500 Twelfth St., Chicago

RHUBARB WAGNERS IMPROVED

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also E A G L E Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for

bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc. And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be., Sulphur Paste, Nicotine, Black Leaf 40, etc. Fungicides and Insecticides. Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.

624 California St., San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

The New 16 valve

Twin City Tractor

PAYS BIG DIVIDENDS

For the first time in the history of the tractor industry, the 4-cylinder, 16-valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16-valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last, and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Story of Two Corn Fields

IN 1916 two 40-acre fields of corn grew side by side in Illinois. On one an International spreader had been used consistently for three years. The other had seen no manure for seven years.

That was the only difference between those two fields. One produced a matured crop running just over 80 bushels to the acre, the other averaged barely 30 bushels of soft corn. If both crops sold at the same bushel price, the fertilized field produced \$2,000 more than the unfertilized one.

Was that spreader worth \$500? Yes, because just scattering manure on a field will not accomplish the same results. That field of 80-bushel corn was properly fertilized by a man who knows his business. He feeds his crops a balanced ration. This cannot be done without a good, wide-spreading manure spreader. It is being done by these spreaders:

Corn King — Cloverleaf — 20th Century

It pays to study fertilizing, to know what to do and to practice what you know. See the local dealer or write us for a copy of "Feed Your Hungry Crops" and full information about our spreaders, or about any other machines in the list below.

Lima Bean Crops and Markets

(Written for Pacific Rural Press.)

Can lima bean growers get back the cost of production this year? The answer is not doubtful. On the average, they cannot. The total acreage in this crop is estimated by Manager R. L. Churchill of the California Lima Bean Growers' Association at ten or fifteen per cent less than last year, but the total tonnage expected is about 66% per cent less than last year. In one of the districts which usually produces good crops, about 2,000 acres farmed by 25 growers will average about 1½ sacks per acre. This was not irrigated; but one of the best irrigated fields under normal conditions is yielding this year only half as much per acre as last year.

Many irrigated fields are still green and growing—if bad weather does not damage them, they promise a good crop. But only about one-fourth of all the limas are irrigated and many of those fields lost their blossoms without setting pods. All of the non-irrigated fields suffered more or less, according to the kind of soil. Thousands of acres of beans made bushes but did not vine. They bloomed freely but moisture was insufficient to mature beans in pods even where pods set.

Orange county has a smaller proportion under irrigation than Ventura and a 25 per cent crop is estimated. Ventura and Santa Barbara counties are expected to produce 35 or 40 per cent.

The total lima crop is estimated by Mr. Churchill in a preliminary way between 500,000 and 525,000 bags.

Costs of Production.

Last year Mr. Churchill obtained data on costs of production from eight or nine rather large lima bean ranchers, who keep detailed records on cost of production in three different counties. One man with 727 acres valued his land at \$700 per acre and charged the crop with interest on that valuation. He obtained a high yield, which made the cost of production \$6.28 per hundredweight. Another man valued his land at \$300 on a 650-acre ranch, but a low yield of 7½ bags per acre made his cost of production \$9.35 per cwt. in spite of the low valuation. Another man charged his crop on 1400 acres with a rental of one-third of the crop, which he had to pay. This in addition to the normal cultural expenses made his crop of 900 pounds per acre cost \$8.29 per hundredweight. The average of all cases investigated was between \$7.80 and \$8 per cwt. These people, being the kind that keep accurate accounts, probably had as low costs as any.

The cost of production this year involves an increased outlay for labor and supplies, so that the cost of production per acre has been increased. Owing to the light crop, the cost per acre for threshing and bags has decreased, but these are small items in the cost of production. So the cost per hundredweight this year is way above that of last year.

If the price of limas were set according to their food value per pound, based on the prices of many other foods, limas would sell for the cost

of production plus a profit to the grower. But consumers are not likely to buy them on the basis of food value, and it is not expected that the beans will bring the average cost of production.

"Baby Limas."

The situation with regard to "baby limas" is different. "Baby lima" is a trade name for Henderson Bush limas, which cook and taste about the same as regular limas; but in the commercial product other varieties are sometimes mixed. They set pods under the dryness and heat of the interior where regular limas would drop their blossoms and small pods.

Most of the baby limas are grown in the San Fernando Valley, and all are under irrigation from the Owens River project. Growers there had about the same acreage of teparies last year as they had of baby limas. The teparies did not pay, so they have been replaced this year by sugar beets and baby limas, increasing the total acreage of both. No regular limas are grown in San Fernando Valley.

Lima Market Conditions.

Aside from the loss to growers due to light yield, market conditions are considered more satisfying than those for common beans. The "Manchurian limas," which might compete with ours as the Kotoshish of Japan compete with our small whites, are not worrying the California Lima Bean Growers' Association much, because they are of inferior cooking quality, remaining hard and relatively tasteless. Limas from Madagascar, however, would compete with ours in quality and price were that island not under French protectorate, and its beans likely to be shipped to France and England rather than to the United States.

A rather unfavorable condition at present is the fact that a larger quantity than usual of last year's beans of all varieties have been shipped to wholesalers and jobbers since April, so less demand is developing for new-crop limas in spite of the fact that other varieties compete with limas only indirectly.

Growers' Organization Stronger.

The Lima Bean Selling Agency, which was formed last March by a general coalition of independent growers and dealers with the Growers' Association, so as to control at least 80 per cent of the unsold crop, performed its function admirably and dissolved recently. Its apparently most enduring result was to turn about 80 per cent of the total number of lima growers into the association. This means that the Association is in a strong position, although the actual tonnage likely to be handled is less than last year, when a much smaller proportion of growers marketed through the organization.

Opening Prices Soon.

In view of the lack of uniformity in yields from the early threshing and the unsettled condition of the general bean market, the association is wisely deferring any sales and will not decide its opening prices until late this month.

LATE FIGURES ON CANTALOUPE CROP IN IMPERIAL.

How much does the grower get out of his crop? The following figures are furnished by Dr. Geo. P. Clements, Agriculturist, Los Angeles Chamber of Commerce:

Number of acres cantaloupes	14,088
Number cars cantaloupes	7,830
Number crates cantaloupes	2,630,880
Number cantaloupes shipped	118,389,600
Average crates per acre	187
Approximate cost place crate cantaloupes on platform	\$ 1.15
Approximate gross money received at receiving end	3.50
Approximate cost per crate for commission, freight charges, refrigeration, operating loading sheds, furnishing all material and labor, etc., by distributor, charge at 16 per cent on gross sales	2.00
Cost of crate and wrappers to grower25
Net profit to grower per crate45
Growers made approximate average net per acre	121.55
Picked and shipped per acre per cent of car	56%
Distributors advance per crate as the growers haul them in	1.00
Growers pay for picking and packing	
Gross returns for crop	9,208,080
Net returns to growers	1,710,072
Total of all cost to handle crop from time ground is rented until cantaloupes are delivered to the other end	7,498,008

A Maxwell Truck you buy this Month will make you a present of its Total Cost in One Year.

More miles per gallon
More miles on tires

FIVE-thousand-dollar truck construction. Five-thousand-dollar truck guarantee. Worm Drive. 10-foot loading space. Electric lights and generator. 2400 pounds—we built it right to get it light—to save tires—to reduce gas consumption—to climb hills—to take bad roads—and to keep repair bills down.

For long hauls and short calls. Self-supporting. Amateur proof. Chassis \$1185 f. o. b. Detroit.

If you like, take your time with the payments and let the Maxwell buy itself on the run.

Pays its way from day to day.

MAXWELL MOTOR COMPANY, Inc.
DETROIT, MICHIGAN

NEVADA NEWS NOTES.

(By Our Special Nevada Correspondent.)

Mr. C. C. Tidd of Smiths Valley is building a modern dairy plant and will soon establish a herd of pure-bred Holsteins.

Farmers on the Newlands Project, the Carson Valley and Truckee Meadows are enjoying excellent crops of hay and grain. Hay has been sold as high as \$18.00 in the stack. Treshing is nearly 25 per cent complete.

The Department of Animal Husbandry of the University of Nevada has just received a young Epochal Berkshire herd boar from the herd of E. B. McFarland of San Mateo, also a Poland-China herd boar from Hale March of Modesto.

Crops and ranges in eastern Nevada are very short, owing to a shortage in rainfall and irrigating water. Many breeding cattle are being shipped out of this section to Lovelock, Truckee Meadows, the Newlands Project, and to California points for the winter months.

Squirrels are reported to be a great pest in eastern Nevada, near Metropolis. Unless some immediate and definite steps are taken to eradicate them great losses in production will prevail; also development work in reclaiming sections in this vicinity will close down.

A considerable number of range men are seriously considering the erection of silos in order to meet frequent shortages of winter forage. A goodly number of new silos were built this year, and if silage proves of merit for wintering livestock a great many new silos will be put up in 1920.

Mr. Ed T. Morgan of Northam, formerly herdsman for the late Governor Sparks, has lately taken over a bunch of Hereford breeding cows, with the herd bull, Alamo Reuben, from the Alamo herd of W. D. Duke, Likely, California. Mr. Morgan will soon be out on the Western Fair Circuit with a show herd.

Fallon cantaloupes are being shipped to the principal cities of Nevada; also to points in eastern and northern California. The cantaloupes from this section are of very high quality. The isolation of this section from a large market handicaps the enlargement of this industry to a great extent. Watermelons and various fruits are being shipped in very limited quantities.

The Indian Service in Nevada is establishing Indian villages near farming sections in order to give them a home place. This encourages agricultural work rather than along other lines not so well suited to their temperament. Farmers in eastern California and throughout northern and eastern Nevada consider Indian labor to be excellent for general farm work. This is especially true in the hay and grain fields.

Farmers in the Truckee Meadows are in the midst of a suit to establish the water rights of the community. The suit was brought by the Government to establish all water rights of users of water out of Lake Tahoe, the Truckee river, and its tributaries. Judge Farrington, of the Federal Court, after taking considerable testimony in August, continued the trial until October in order that the farmers could harvest their crops.

Many bands of lambs and old ewes are being brought off the ranges and pastured on the meadows for short periods before being shipped for market. Some owners are also bringing their breeding ewes in on the meadows. Smaller bands numbering one thousand to twelve hundred are being run on pasture this year. Flock masters declare that the day of two thousand head of sheep in a band for meadow pastures is over. They state sheep make greater gains, waste less feed, and leave the fields in much better condition, if pastured in smaller bands.

THE BEAN OUTLOOK FOR THE MONTH.

The bean harvest in Southern California is proving very disappointing in yields, according to the Bureau of Crop Estimates, which forecasts 625,-

000 hundred pound sacks of lima beans as compared with 1,545,000 sacks in 1918.

Other beans are falling short of estimates in Santa Maria and Lompoc valleys, though the condition is better in Salinas Valley. A two weeks' hot spell in August in the Sacramento valley lowered the percentage there seven points to 71 per cent of a normal crop. All beans (limas included) in the State indicate a crop for this season of 4,814,000 bushels; compared to final estimates last year of 8,584,000 bushels.

RICE LEASING TERMS.

The 22,000-acre Conway Ranch at Woodland is looking for lessees to plant rice on their land. They promise to plow the land this fall and to furnish water next year when it will be needed. They agree to accept one-third of the harvested crop when put on the warehouse scales, as their total payment. In turn, the lessee must contour and check his own land, else pay the ranch to do it. He must put up \$2.00 per acre bond after he accepts the allotment of land which may be assigned him. This is to insure planting. Harvesting and warehouse needs will be taken care of for him, at his expense, by the ranch.

A PERFECT STAND OF RICE.

The Conway Ranch at Woodland this year has nearly 3,000 acres of the finest rice to be found in the Sacramento valley. This is the joint opinion of Professors Hendry and Madson of the University Agronomy Division. No further advanced or more even stand can be found anywhere, nor one more free from watergrass, they say. Last year the Conway Ranch suffered from water shortage and only 80 acres were harvested. Therefore, the present crop is practically on first year land.

PERFECT FARM MACHINERY

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property. Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops next year will bring higher prices than now, so take advantage of this condition and get your land under cultivation.

Only an acre a day

Ten acres a day is the modern way

Which side of the fence are you on?

Are you a one acre laborer—or a ten acre farmer?

Do you cling to old, slow, out-of-date animal labor—or are you farming the modern way with the Cletrac?

The Cletrac Tank-Type Tractor enables you to do more work and better work more days in the year—with fewer men, shorter hours and less expense.

It produces larger and better crops at a lower cost thus materially increasing your profits.

It plows, harrows, plants, reaps, binds, threshes, cultivates, hauls, saws—does practically all the things that your horses, mules and stationary engine used to do—and does them better, cheaper and faster—requiring considerable less man labor to accom-

plish the same amount of work. You—or your wife—or your boy, can operate the Cletrac and do as much work with it as was formerly done by three men and three teams.

The Cletrac runs on metal tracks like a locomotive. It goes over the top of the ground,—doesn't sink in, doesn't pack down the earth even when it is freshly plowed. No power is wasted in moving the machine itself through the soil.

The Cletrac is the answer to the acute farm labor question. Call on the nearest Cletrac dealer and look it over carefully.

Send for our booklet "Selecting Your Tractor." It is full of good, sound, practical information that every farmer should have.

Cletrac TANK-TYPE TRACTOR

(Formerly known as the "Cleveland Tractor")

State Fair Machinery Notes

The Killifer Exhibit, besides their regular line of deep tillage tools, included an extra heavy automatic disc cultivator suitable for rice fields.

The Avery Company of the Pacific were not able to show their new 7-14 horse-power tractor, which will, they say, soon be on the market.

The new G. M. C. Samson 50 tractor is equipped with Tungsten steel exhaust valves to prevent pitting. The intake valves are half Tungsten.

Neal Weaver, distributor for the new Hart Parr Tractor, sold a machine during the State Fair to the son of the man who handled the Hart-Parr at Dixon, over ten years ago.

Messrs. Myers & Hart have bought the Knight & Lee tractor. It has been re-named the Stockton tractor. The new company state they will soon be making these machines in quantities.

The end-plates in the Monarch tractors, which were formerly made of cast iron, are now made of vanadium steel.

The side frames of the track in the Bates Steel Mule are now made of channel structural steel to prevent bending.

Much interest was manifested in a Lauson tractor, set up on blocks and operated by a motor connected with the fly-wheel.

The Linn tractor made its first appearance at the Fair. It is a truck with rear wheels replaced with Caterpillar type tracks.

A Nisco manure spreader in the big exhibit of the Pacific Implement Company was equipped with high side racks and auxiliary reel for spreading grain straw, bean straw, or alfalfa.

A seven-gang power lift disc, weighing 3600 pounds, said to be the heaviest made in America, was part of the LaCrosse exhibit.

Among the new tractors were the Victory exhibited by Grissel Bros. of Stockton and the Wisconsin tractor exhibited by the Automotive Products Co. of San Francisco.

The Huber Light Four weighs five thousand pounds and pulls 2500 pounds on the drawbar at 2½ miles per hour.

Farmers from Tehama, Butte and Sacramento counties bought Twin City tractors during the first few days of the Fair.

The Knapp Power lift disc plows in gangs of two and three discs were shown by the W. L. Hughson Company, who have added it to their line of tractor implements.

Power Lift McKay Tractor gang disc plows with subsoiler attachment for each disc were shown by the H. V. Carter motor company.

According to a sign in the Sandusky exhibit, five hundred Sandusky tractors have recently been ordered for shipment to France.

The Oliver Chilled Plow Works featured an enormous three-gang plow, whose purpose it is to "farm the farm under the ordinary farm," also a breaking plow with long, narrow moldboard twisted like augurs to insure turning the sod up side down.

The International Harvester Company for the first time showed their own line of plow, formerly the P. & O. line.

A 20x36 horse power tractor was the brand new addition to the already large Case family.

The Yuba Ball Tread tractor, as usual, drew the crowd.

The Holt Mfg. Co. exhibit, which occupied the entire end of the large tent, included 75-horse caterpillar, operated by a motor, with many of the working parts uncovered, notably the big chain drive, which ordinarily is completely enclosed and running in oil.

The Moline Company exhibited a new power lift disc, built especially for use with their Universal tractor.

The Bean tractor shown at the State Fair still monopolizes the single track pull, which enables it to run close to trees and turn shorter than implements can follow.

Exhibitors of the Cletrac tractor were kept busy explaining how, in spite of its small size, it can do the work of six horses or mules.

Onion and carrot seed is far above normal, heads weighing up to two pounds. The stalks are nearly as high as a man. Such seed will net about \$750 an acre. The season has been exceptionally good, so good that an oversupply may result as there was a surplus left from last year.

Alfalfa sown in the fall under the right conditions has shown a growth next season nearly as heavy as two-year-old alfalfa. Fall seeding is worth knowing about.

SEND FOR BOOKLET which tells about it, explains the conditions under which it pays, and contains much valuable alfalfa information. Sent free with Price List and Booklet describing Bomberger's Seven Kinds of Alfalfa.

8-ft. Extra Heavy Tractor Chisel

KILLEFER
QUALITY

Now is the time to commence deep chiseling and subsoiling. Do it in time to prepare the ground thoroughly to receive the benefit of the winter rains. Break away from the old habit or mistaken idea of scratching the ground and expecting to harvest a crop.

Plow pan, although frequently referred to as mechanical hard pan, should not be confused with natural hard pan. However, so far as crop production is concerned, the effects of plow sole and hard pan are the same. Both must be destroyed before proper cultivation can be had, and the only difference in the two that will be considered here is in the method required for their destruction.

Plow sole offers less resistance to the available methods of breaking it up than hard pan, and, with the tractor and tool of sufficient

strength now available for tractor use, it can be broken up and subdued, bringing the land back to the point where a full yield may be expected.

Plow sole offers less resistance to tillage implements than does hard pan; both are in many cases impervious to horse teams and ordinary plows, and in some instances are difficult of handling with tractors and modern implements. Yet before a full yield may be expected, this condition must be subdued, and to date the only satisfactory means is by use of the chisel or subsoiler.

Monterey County Is Finding Herself

(Continued from first page.)

district on the other side of the valley and see more home-building based on the dairy industry. Above Greenfield notice the subdivision recently put under pump-and-cement pipe irrigation. It is now green with beans and other crops. Deep plowing on the unirrigated part of this subdivision has resulted in bushels of grain being produced where pecks were grown before.

Across the river is another irrigated district of considerable size, using water from the Salinas River. Another irrigation district of smaller size uses water from San Lorenzo Creek, which could be dammed to hold 12,000 acre feet. This country is tributary to King City, the metropolis of the upper part of Monterey county and a rapidly building town based entirely on the agricultural and livestock country around it.

Note as you go southward and the valley narrows that you are seldom out of sight of an alfalfa field lately planted to provide cattlemen not "against the rainy day," but against the dry days when cattle otherwise would starve in seasons of exceptionally light rainfall.

Near the southern end of the county turn up San Antonio creek and see some more evidences of the general awakening to fruit and agriculture.

On the opposite side of the valley but best entered by crossing into San Luis Obispo county and driving north-eastward from San Miguel is another rapidly developing district—the Cholame valley with Parkfield as its center of business. Dairying and field crop raising have been the chief occupations here, but over 100,000 fruit trees are said to have been planted here last winter.

Greater Possibilities with Present Crops.

Among the products of Monterey county, none has general human interest more than the "Salinas Burbank" potato. Luther Burbank had crossed the continent about 1870 with a few of the first progeny of his original Burbank tuber. About the year 1872 these had multiplied enough so that he had some to sell for seed. He advertised them in the Pacific Rural Press. A potato grower of Salinas bought a pound of the seed for a dollar. The new variety took like wildfire and soon displaced all other varieties here and spread generally to other parts of the Pacific Coast. The superior quality of the Salinas-grown Burbanks soon commanded a premium on the market that has continued to this day. But continuous cropping on the same ground was too much for even this variety and soil, so that in the past five years or more, potato growing has been on the wane. There is larger acreage this year than last, however; and with proper rotation of crops, there is reason to believe that the former prestige of this crop may be profitably regained.

The small-white bean crop for which the lower Salinas Valley seems well suited, attained great popularity last year, but a combination of rain damage and poor markets is responsible for smaller acreage this year. The yield in Salinas valley is considerably less per acre than in the Santa Maria valley of Santa Barbara county anyway, but there is no need of letting the southern valley excel. Growers are just beginning to realize the necessity of fine, deep seedbeds and finer cultivation.

Barley has been the leading field crop of the Salinas Valley and 100,000 tons have been produced here in one season. Last year the crop was 21,000 tons in the entire valley. This year it is 17,000 or 18,000 tons and will probably decrease as markets become less attractive and more intensive farming develops. The lower lands of this valley have become known afar for the Chevalier variety on which it has had almost a monopoly.

Wheat has been a more important crop than it is now, especially in the upper central section. The chief trouble with this as with barley has been the common lack of rotation and the common practice of plowing just enough to cover the grain. The plow-

pan which resulted has prevented winter rains from soaking into the ground. That the fertility for grain is not exhausted on land which had ceased to produce good crops is indicated by the greatly increased crops of grain obtained just below King City after deeper plowing. This deeper plowing has to be done judiciously, however. Not too much should be turned up each year, and the seedbed must be packed before or soon after planting.

Dairymen are among the most unceasingly prosperous people in the valley. Many of them have irrigation for alfalfa, either by gravity or pump, or both. Electricity is available, for pumping in most parts of the valley, and many gas engines have been installed. There is a peculiar failing among dairymen, however, in this land of plenty, for with an abundance of barley at hand to make a balanced economical ration with their alfalfa, they generally feed alfalfa alone, wasting a considerable part of the valuable protein in their hay and in some cases injuring the health of their cows. The barley they could feed in proper amounts would in most cases be more than repaid by increased milk, and would permit the cows to make full use of nutrients in the alfalfa. More cow testing and more registered bulls would increase the output per cow on the same feed.

Dairymen's markets could not be better. One of the big condensaries of the State is located at Gonzales, and butter factories are generally not too far away from Salinas valley farmers. In the smaller mountain valleys the traveler notes many a ranch cheese factory whence comes most of the famous Monterey cheese, comprising about a fifth of the entire cheese production of the State.

Cattlemen Providing Tame Feed.

The oldest and still the chief livestock industry of Monterey county is range cattle. A marked change is coming over this industry. A few years ago Monterey county saw her cattle starved to death in great numbers, though not so much as in many other districts. Some of the cattlemen had cut a little wild hay, but it fell far short of the amount required. Many and many of them have since those years planted alfalfa in bottom lands and have put up the hay against dry days that may come.

Corn silage for cattle produces a great tonnage per acre and a few beef cattlemen are feeding it. They are well pleased, and perhaps this prefigures a more intensive era of finishing the range cattle.

Better blood in the cattle is coming slowly but surely by introduction of purebred bulls throughout the ranges.

A Look Into Coming Years.

Looking forward to a day not far in the future we see Monterey county producing great numbers of cattle cheaply on her plentiful ranges, bringing them to the valleys to fatten on alfalfa, barley, and sorghum grains grown with stored and pumped water. Dairying will support thousands more of happy families on a greatly increased alfalfa acreage. There will be good hogs on every general or livestock farm and they will have plenty of Monterey-grown alfalfa and barley.

The foothill districts and many of the valleys will perfume the air in spring with the scent of apple blossoms, apricots, peaches, pears, almonds, prunes, and other fruits. The open fields will produce greatly increased yields of grain, beans, sugar beets, potatoes, and other field crops. Motor trucks and railroads will carry her products to the south and north and to the west where much shipping will make Monterey a chief port.

Kill Wateregrass In September

Now is the time to begin killing wateregrass, according to C. Nielson of Butte county. Plow it in September, then soak the ground, and let it dry about ten days or two weeks. By that time wateregrass will be well grown and should be plowed under. Plow again rather late in the spring, work the ground fine, and turn the water on.

TIMKEN TAPER TRIUMPHANT

Why did the Wallis Tractor Company put Timken Tapered Roller Bearings in rear wheels, at the differential and in the transmission of the "Wallis Cub, Jr."?

Why have 135 tractor engineers—many of whose tractors were not new in the industry, but had formerly incorporated other bearings—adopted Timken Bearings within the past two years?

There is but one possible answer to both questions—it is because of the correctness of the Timken tapered principle and the ability of Timken Bearings to resist wear has been proved by actual experience in the tractor. Facts—not what engineers say Timken Bearings ought to do under certain conditions, but what they actually have done—caused the Wallis Tractor Company to put Timken Roller Bearings at hard service points in place of other bearings. Facts, not theory, are responsible for the installation of Timken Bearings in one make of tractor after another.

There's more about bearings in the booklet "Timken Bearings for Farm Tractors." Write for your copy.

THE TIMKEN ROLLER BEARING COMPANY
Canton, Ohio

MODERN EQUIPMENT

For Farm and Dairy

Modern farm and dairy equipment pays. It pays in dollars and cents. It pays in labor saved. It pays in more comfortable living. It pays in many ways. Power machinery and the substitution of mechanical methods for hand labor have revolutionized modern farming, freeing the farmer and dairymen from the long tedious routine daylight-to-dark labor and giving him his share of the good things of life.

We specialize in modern farm and dairy equipment and handle more lines of farm and dairy ranch machinery than any other farm equipment house on the coast. The California Hydraulic Engineering and Supply Co. is known throughout the State for its activity in behalf of more efficiently equipped farms and dairy ranches. If you contemplate the purchase of modern equipment of any description, write to us. Years of experience are at your command. Every inquiry answered promptly and fully.

"DURO"

Deep Well Systems

JUST the thing to bring suburban or country home right up to date.

Pumps water from wells, where depth to water level ranges from 22 to 150 feet, and supply it under pressure for all purposes about the house or grounds.

"Built like a battleship," economical and entirely automatic in operation.

Send for Duro booklet

AMERICAN PUMPS

We are distributors for American Standard Horizontal and Vertical Pumps—and Turbine Centrifugals.

They're the best pumps on the market. They cost a little more—but last longer and are decidedly cheaper in the long run.

American Pumps are famous for their large capacity and high efficiency.

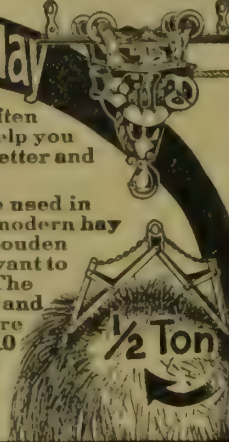

We also have special pumps for direct connection to motors.

Write for Pump Catalog.

Which Way do You Make Hay

Hay harvest usually catches you in rush season—and often short handed. Come in and let us help you figure out a way to handle your hay better and quicker. **LOUDEN HAY TOOLS** have been standard since 1867, and are used in every civilized country. Most of the modern hay tool ideas have originated in the Loudon factory at Fairfield, Iowa, and we want to tell you about some of the Best. The Loudon Hay Slings, Forks, Fork and Sling Carrier, and Power Hoist are unequalled. Whether you have 10 acres or 1000, Loudon Hay Tools will pay for themselves quickly.

SEND FOR FREE BOOK OF BARN PLANS AND COMPLETE LOUDEN CATALOG.

UNIVERSAL

Milking Machines

With a Universal Outfit, one man can do the work of three—thus actually eliminating the work and expense of two men. Solves the labor problem. Gets your milking done better and cheaper. Write for catalog.

Louden Barn Equipment

Healthier cows, more milk, purer milk, less feed, and less labor—if you barn is Loudon equipped. The Loudon line includes Steel Stalls and Stanchions Feed and Litter Carriers, and everything needed for the dairy rancher. Write for catalog.

ENGINES in All Sizes

We have engines in every type and size—from 2½ H. P. to 100 H. P., operating on distillate or low grade fuel oil. Our lines include Western, Faultless, and Muncie Oil Engines. We'll show you how to get the most power and the best results at least cost—and that's what you want.

Come and see these various machines in operation. Ask questions. Talk your needs over with us. The suggestions we make may save you dollars—and trouble, as well.

MEASURE OF A GOOD BULL.

We see articles on the value of herd bulls written by our best talent, but still we can put in all our spare time studying on this one subject and then never learn it all, as some bulls will not do what they should and others will do more than is expected of them, says G. R. Jowell in the Hereford Journal. However, there are many external indications of individual excellence, and a good herd bull should possess the following characteristics:

Large, full nostrils; big full eyes and a mild expression; good width between the eyes, with a square forehead; a short, strong head and horn, plenty big at the head; a neck tying into the head neatly and smoothly, and into the shoulders the same way; a broad, flat shoulder, blending smoothly at both sides; a strong, big forearm, and a broad, flat knee; plenty of size in the shank bone; an exceptionally short ankle; full in the

heart and above; broad between the legs and properly filled in; a short, clean-cut neck; great depth in body and flank; a well-prung rib, short and loin, tied in well at both ends; plenty of length of hip, and as wide in the hips as anywhere; just as much width through the thigh as through the hips; a well-filled twist as that insures a deep flank; legs short, wide apart and straight; a hide not too thick or too thin—not too hard or too soft; masculine, but not coarse; a strong constitution and compact conformation; a brisk, agile movement; a bull that is hard to whip, but not quarrelsome; one that responds quickly to feed; a good disposition, by all means; a bull that weighs a ton in breeding condition; a bull that is prepotent in his good points.

KINGS COUNTY FAIR, 1919.

Twenty acres added so that it was possible to build an 80-foot mile track thrown up on the curves in the most approved manner, making it one of the fastest automobile dirt tracks in America, new swine sheds, new agricultural implement shed, new office, new restaurant building, and all buildings electrically lighted, is what Kings county has done to accommodate the exhibitors and patrons this year.

In the livestock line the dairy cattle and swine feature is a very large one, particularly in the Holstein-Friesian and Poland-China classes. Horses, jacks and mules were also much in evidence.

W. J. Higdon of Tulare is here with a fine string of his blue-ribbon cattle; A. B. Comfort, F. D. Ross and G. W. Clark, with their local herds that will contest places in the Holstein-Friesian department.

J. E. Thorpe of Lockeford is on deck as usual with 17 Jerseys and 12 Duroc-Jerseys, and is lamenting the lack of competition in his classes.

The list of exhibitors in the Poland-China classes is legion far too numerous to enumerate this week, but are all local breeders except Buckland & Son of Fowler, who are over with a nice showing.

On Tuesday awards were made in the community exhibits—first going to Grangeville on a really wonderful booth showing all their varied agricultural, horticultural and farm products to the very best advantage; second to Lemoore, third to the island north of Lemoore, and fourth to Corcoran, on a very pleasing booth, showing plenty of cotton and grains, but lacking in horticultural items.

MARSH-MCCRACKEN POLAND-CHINA SALE.

Those desiring big type Poland-Chinas that have been bred in this line for generations and sure to reproduce this very desirable fashionable kind, should not fail to attend this sale. From Mr. Marsh's herd, stock from such boars as Model Major, I. B. A. Wonder and Big Model mated to sows of Big Bone, Blue Valley, Giant-ess and A. Wonder blood lines.

Many females of the same breeding from the McCracken herd, which is headed by that wonderful sire and individual, Kings Big Bone Leader, than which there is no more popular herd leader in California at the present time. Probably no sale listed has any more good ones in it than this one. Those who know what uniformly promising stock is sired by King's Big Bone Leader, should be on hand to secure some of the sows and gilts bred to him. If you want prize winners or breeding stock, do not miss this chance. Go and see them and you will buy them.

Hogs occasionally get off their feed and this is generally brought about by over-feeding. At such times some breeders endeavor to tempt a hog's appetite by changing his feed and giving him something that he relishes, but probably the best way is to simply confine him where he can have nothing to eat and give him only water. Leave him in the pen until he gets up and appears real hungry when you call him. Then start him with a little thin slop and gradually get him back on his feed.

Alfalfa Market in Dairy Steers

Egbert George, president of the Tulare Poultry Association, and farming 70 acres of alfalfa land south of Tulare, without help except for having and at occasional odd times using dairy steers, as the simplest and least laborious method, of marketing his alfalfa, claims that it brings him almost twice as much as hay alone would, sold at market price. He has four cows milking and a good deal of his time is taken with his poultry, and steer feeding is a simple proposition. He buys the young stock at from three to six months old, they costing him as a general thing from \$10 to \$20 each, depending upon size and quality and they are marketed at about a thousand pound average when somewhere near three years old. They are given the run of alfalfa pasture and in addition hay is fed every day in the year, no matter how good the pasture is. As a result the animals are always plump and the meat thick and of the best quality.

bringing a high price in the market.

Most of the animals are Holsteins from surrounding dairies. Some have a good deal of Shorthorn blood in them and they make fine steers. While beef breeds would develop quicker and better than dairy steers, they are not to be had, and it is far more profitable, according to Mr. George, to buy young stuff from dairies than to support beef breed cows for the sake of their calves. Asked if it would not be more profitable to buy heifer calves, Mr. George replied that it was too risky a business to depend upon finding a market for every heifer that came fresh, and he could not afford to add them to his dairy, and to top it all prices for a first-class, well-fed, fat Holstein steer were hard for any heifer to beat. About 15 steers are turned off per year, the number kept depending upon the amount of ditch water supplied to the ranch and the consequent size of the alfalfa crop.

PRESTON SCHOOL AYRSHIRE SALE.

This sale was a disappointment in the rather low average obtained. Many reasons have been assigned, but it was probably due more to the fact that people generally do not know the great worth of this Scotch breed of dairy cattle. For certain conditions they are unexcelled and the breeders of them should get their worth before the public. When they do so there will be no difficulty in holding successful Ayrshire sales.

The top price of the sale was \$400, paid by H. P. Faye of Knight's Landing for a junior 4-year-old, Cedar Hill Queen. The average for the 48 head sold was \$147.08.

BUTTE CITY RANCH COW SELLS FOR \$4,500.

Laurel Frantic 33rd sold last August at the Butte City Ranch sale for \$480, but now brings \$4,500 at the Jackson Farm Bureau picnic and purebred auction sale held at Medford, Oregon, September 13. The cow is seven years old and was bought by E. E. Beeson of Talent, Oregon, who was purchaser of other good ones at the same sale. This news comes via the Sacramento Bee, which quotes the "Oregonian," which also states that at the same sale four bulls made an average of \$401.25 and 11 females \$890.45.

It would seem from the above that our prices for registered stock are not high enough or not in keeping with other parts of the country. It certainly does not seem as though a seven-year-old cow could have increased so much in value in such a short time.

By the way, Thos. Harrison, the

well-known Milking Shorthorn breeder of Santa Rosa, states that he has Laurel Frantic 25th, 28th, 31st and 32nd at his ranch and that they are a great lot of females, hard to beat anywhere.

HENDERSON SALE OF BLACK AND WHITES.

A success from all view-points will in a few words tell the results of the great sale of Holstein-Friesians. Fifty-six animals sold for \$14,490, an average of \$258.75.

The top in the female list was Baby Lyons Tiffany, a senior 4-year-old, sold to W. J. Horan of Stockton for \$490. The bull, Model Domino Glista, sold to J. W. Scudder of Holt for \$425 and was the top on the male side.

The bulls were practically all youngsters, except Model Domino Glista, and he a senior 2-year-old. The nine bulls sold went to eight buyers, giving a wide distribution.

The buyers of females also were quite widely distributed. R. S. Holmes, the Modesto breeder, taking home a nice lot; F. H. Harvey 6 females and a bull; W. J. Horan of Stockton a good-sized delegation, and F. V. Dolcini of Davis two good ones.

The Henderson Co. are getting such large herds of Holsteins that those who are in need of such animals will do well to look out for their sales, as they will probably have more of them in the future.

The Bonita Stock Farm of Woodbridge, V. L. Heath, manager, one of the Henderson Co.'s farms carrying registered Holstein-Friesians, just made the highest average for butterfat production in the Sacramento Cow Testing Association for August, which speaks for itself as to the kind of cattle they raise.

Pork Production

BY ACTUAL TEST PURE HAWAIIAN CANE

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

ROUTE 4, BOX 735. SACRAMENTO, CAL.

BERNSTEIN-HAAG POLAND-CHINA SALE.

The day was as near right as they ever have been, even in Hanford, and, therefore, with the high quality of stock always found at a Kings County Poland-China sale, the average could not help but be high. Bernstein's sows and gilts averaged \$210.25, and Haag's \$167.93. The average of 41 head sold by both consignors, including 5 young boars, was \$182.98. The top of the sale came in a year-old open gilt, bred by St. John of Xenia, Ohio, from Mouw stock. John M. Bernstein brought her out last March and considered her one of the best. Thos. Caesar of Reedley finally carried off the prize for \$570, leading the next highest gilt, a splendid animal, sired by King's Big Bone Leader, by \$65. This last mentioned gilt was bought by Les McCracken, who owns her sire, for \$505. Few better ones of this type are seen anywhere.

While the average was high the sale was not as snappy and rapid as such stock would seem to warrant. The crowd was large, but many came to look on and enjoy the bountiful lunch always provided at Hanford.

SAN JOAQUIN CO. POLAND-CHINA SALE.

Thirteen head of boars sold for an average of \$93.84, and eighteen head of sows and gilts for an average of \$153.33.

The top of the sale on the boar side was the year old Governor, bred and consigned by Geo. V. Beckman & Sons, which was sold to the enterprising young breeders, Langhorst Bros. of Lodi, who surely know a good thing when they see it.

The top on the sow side was \$300 received for Orange Blossom, consigned by Eugene Miner and bought by Hale I. Marsh of Modesto. This sow is a good example of the big bone type, and is going into a great herd of the same kind.

Boars were not as ready sale as had been hoped they would be. Buyers were not plentiful and Col. Leachman had to be some auctioneer. The female side of the game went much better.

B. H. Wilkinson, manager of Falfadale Farms, Perris, on a recent trip through the East, purchased an exceptionally fine Duroc-Jersey boar under one year of age for \$2,000. This pig is of the ultra fashionable type, weighing 475 pounds and with an 8½-inch bone. Also a junior yearling sow, sired by Grand Model Supreme, grand champion at Missouri State Fair, 1918, and out of a Pathfinder sow. These animals will be a fine addition to a herd already noted for its excellence.

MONTELENA HERD OF LARGE YORKSHIRES

LAKE PARK KING 25211
Grand Champion Boar—California State Fair, 1917.

Due to the ever-increasing popularity of the breed, Yorkshire breeders are almost entirely sold out, and it would behoove the prospective purchaser to place his order soon. We are only able to offer at the present time a very exceptional lot of fall pigs, some sired by "Lake Park King," others by "Montelena Prince 2d." They are out of such sows as "Deer Creek Nena 8th," present Grand Champion sow of the State, who has averaged a fraction over 17 pigs per litter for nine consecutive litters; "Riverina Nena 9th," one of her best daughters, and "Lake Park Lady Frost 291st," the top sow at the Thomas H. Canfield sale last year.

We solicit your correspondence.

Livestock and Dairy Notes

Dairy.

Kenneth Abbott, formerly Holstein breeder of Northern California, is with the Burr Creamery Co. of Los Angeles temporarily.

J. W. Benoit of Modesto reports selling a Holstein bull to J. A. Edwards of Ceres. This bull's dam has a seven-day record of 21.22 lbs. butter at the age of three years. She is now on yearly test and making a good record.

The great herd of Milking Shorthorns, owned by Alexander and Kellogg of Suisun, have been leased to J. D. Rowe and Son of Davis. These gentlemen will take over the herd December 1st. This is one of the best herds of Dual-Purpose Shorthorns on the Pacific Coast, and contains many noted animals, both from point of performances and show records.

The Holstein-Friesian Breeders' Association of California recently elected the following officers: H. V. Bridgford, Patterson, president; De Lancy Lewis, Los Altos, first vice-president; Frank Helm, Fresno, second vice-president; C. L. Hughes, Sacramento, secretary; H. V. Bridgford, De Lancy Lewis, Frank Helm, Fred W. Kiesel, J. M. Henderson, Frank L. Morris, Gion Gibson, W. J. Higdon, A. R. Magruder, G. M. Brown, A. J. Stalder, W. H. Taylor, J. C. Peck, Owen Duffy and A. Fisher, directors.

According to S. N. Ayers, Secretary of the Associated Dairymen of California, they will shortly introduce through the medium of the "Milk Boss," to be started by the association in various places, new drinks made from whey. These drinks are not only pleasing to the palate but are nutritious as well. This will be one of the methods by which those parts of the milk which heretofore have been allowed to run down the sewer will be saved to the producer and in this way make it possible for the producer to receive more for his product without increasing the cost to the consumer.

Breeders of pure-bred dairy stock on the Pacific Coast will perceive by the premium list of the California International Livestock show that generous amounts have been set aside as prizes for this great industry, fully equalling the amounts for any other cattle class. Dairymen should see to it that the exhibit in their lines are good ones, as many eastern visitors will no doubt be in attendance and they would not want the impression to go forth that California was not adapted to dairying. General Manager True has been given the assurance by the A. W. Morris & Sons Corporation, noted Holstein-Friesian breeders of Woodland, that Tilly Alcartra, the world's champion milk and butter cow, will be on exhibition, which will be a great attraction in this line.

Swine.

Fred M. Johnson of Napa left this week to attend the National Swine Show at Des Moines. While in Iowa Mr. Johnson will visit the prominent herds of Durocs and buy a carload to bring home with him.

J. Francis O'Connor of Castleview Ranch, Santa Rosa, sold a prize winning young boar to D. J. Bastanchury, proprietor of the 30,000 acre Santa Catalina Rancho of Southern California. Mr. O'Connor is rapidly gaining an enviable reputation as a Berkshire breeder and the range of his sales are greatly extending due both to the excellence of his stock and the publicity which he gives his herd.

Mrs. Viola Renwick, owner of El Profito herd of Poland-Chinas at Santa Barbara, was at the Fair looking over the exhibit of her favorite breed and regretting that she did not have her great herd sire, El Profito, on exhibition. Mrs. Renwick reports recently receiving a bred gilt from E. D. Frazer's herd of Drexel Missouri that is very satisfactory. This gilt was sired by Big Bob and was bred to Buster's Model.

Clyde Horr of Susanville was at the State Fair with an excellent herd of

Poland-Chinas. Mr. Horr has the distinction of having the first exhibit of registered livestock at the State Fair from Lassen county. His sow, Horr's Big Orphan, was placed fifth in a very strong class. Mr. Horr knows there is a great future for blooded livestock in his country and has gotten in on the ground floor with his dandy herd of Poland-Chinas.

A report brought to Merced county hog raisers by Farm Advisor Glass from a meeting of the directors of the Farm Bureau Marketing Association, which was held at Visalia recently, was rather disquieting to some of the swine breeders. The representatives of the packing houses present at the meeting declared that big hogs are not desirable in the Coast markets, and will not bring as good prices as the smaller animals because of the greater amount of poor meat found on big-type swine.

Dwight Putman, Duroc breeder of Nebraska, and judge of all Duroc-Jersey classes at the State Fair this year, claims his greatest surprise came in the aged sow class. Eight sows scratched and only 10 of the 18 en-

tered were turned into the ring. According to him they were all world-beaters. Any state, he says, that can produce animals of such a typical breed type, is in the Duroc game for good and is easily up to corn belt standards. Ringside opinion agreed that if any one breeder owned all 10 sows he would have the finest herd in the West.

The annual meeting of the California Poland-China Breeders' Association was held at the Travelers Hotel, September 3rd. Election of officers resulted in the re-election of President Wm. Bernstein of Hanford and A. D. McCarty of San Francisco as secretary. The election of a director from each county association resulted in the election of M. Bassett from Kings county; A. J. Elliot, Tulare county; Fred Gatewood, Fresno county; Eugene Miner, San Joaquin county and R. P. Yates, Glenn county. Better than \$1,000 was raised by subscription for breed promotion purposes. Many questions bearing on breed publicity were discussed and much good will no doubt be the result. Arrangements were made to hold a consignment sale of 60 head of this great breed at Davis during Farmer's week the coming winter. Also it was decided to offer two silver loving cups for two classes of fat bar-

rows under 6 months and 12 months, respectively, as well as continuing the trophy for best futurity litter.

Miscellaneous.

The reasons for the Fourth Annual Ram Sale, held at Salt Lake city August 26th to 29th, inclusive, not being such a pronounced success as in previous years was due to the railway strike preventing shipping by Arizona and New Mexico breeders and the drought in Montana and Wyoming discouraging breeders from those states. The lack of success is only a seeming lack as the phenomenal success of the past makes an ordinary sale seem like "small potatoes."

The National Dairy Show to be held in Chicago, October 6-12 inclusive, will offer many interesting exhibits. A milking contest for cash prizes; the largest cheese ever manufactured, weighing 32,000 pounds, will be on exhibition; \$400 in scholarships, silver cups and gold medals will be offered as prizes to judging teams from the agricultural colleges, and above all the greatest show of dairy cattle ever staged in the United States.

Consignment of fine stock for the auction sale which will be held at the Southern California Fair are being received at the secretary's office and from the high grade of the stock listed it is assured that this first sale will be a great success. Among the consignments made are some finer Holstein Heifers from the ranch of Geo. A. Smith at Concoran, a car load of Guernseys from the famous Palo Alto Ranch, a fine string of Jerseys from some of the best herds in California and Shorthorns from the Hall Ranch at Perris and from recently received Eastern stock. The sale will be held on Friday and Saturday of the Fair and will be under the management of W. C. Lookingbill. Those interested in this sale should by writing to the secretary of the Fair, W. W. Van Pelt, Riverside, for information.

Livestock Queries and Replies

Mange.

To the Editor: I have a horse that has a bad case of the mange. Please tell me what to do for it.—A. H. G., Mountain View.

(Answered by Dr. E. J. Creely, San Francisco.)

First, whitewash the stall every week. Scrub the harness with Pearson's Creoline and hot water. Second, scrub the affected parts with hot creoline water (especially the mane and tail). When dry apply Lugol's iodine solution and mix and apply the following once daily: Cottonseed oil, 23 ounces; milk sulphur, 4 ounces; turpentine, 2 ounces; Balsam Peru, 1 ounce; gasoline, 2 ounces. Water, curry comb, brushes, harness, etc., must be rendered sterile and be certain other animals are kept from contracting the disease. Report results in 30 days.

Mastitis.

To the Editor: I have a cow that developed a partly caked udder, then was all right for three or four days. Trouble returned in one quarter of the udder at a time. The right front quarter clogs up about every fourth milking. What is the trouble?—F. H., Kenwood, Sonoma Co.

(Answered by Dr. E. J. Creely, San Francisco.)

Mastitis. Anoint once daily with hot olive oil. Massage the affected udder thoroughly but gently. Hot water bathing benefits. Inject oxygen into the udder once daily after carefully milking. Begin by giving a good dose of salts. Give one tablespoonful sal-nitre in bran mash once daily. The milk is unfit for human consumption.

Cream Churns Hard.

To the Editor: We have a heifer that freshened recently and gives excellent milk and cream, but I cannot make good butter from it. It takes a long time to churn and when it does come the texture is soft and color white; in fact, not much better than whipped

cream. Does not get hard even when put in a cold place. The cow is in fine condition and is fed green corn, hay and some wind-fall pears. She seems to have an abnormal appetite, however, as she eats all the straw out of the horse manure in the corral and some of the manure also. Will look for an answer in your paper.—Mrs. E. P., San Lorenzo.

(Answered by Livestock Editor.)

Everything about the cow seems to be all right except the abnormal appetite. If not supplied with salt regularly I would advise placing a lump of rock salt where she could have free access to it. Her eating the manure is an indication that she does not receive saline matter enough. You do not say how you separate the cream from the milk, but I suppose by setting it in pans. Milk should be cooled to a point as low as 50 deg. by the ordinary thermometer as quickly as possible after milking and kept at that point until ready to skim. After skimming raise the temperature of the cream to about 70 deg. and hold at that point until sufficiently sour or thick, stirring occasionally. Then reduce the temperature to 60 deg. for churning and proceed as you have in the past. If this does not solve the problem there is something wrong that you have not discovered.

A BIG STOCK SHOW AT LOS ANGELES.

Manager C. R. Thomas of the Los Angeles Live Stock Show says the prospects for wonderful exhibits in all departments will be realized during the show week—October 18-26. Entries closed last Saturday and were far in excess of anticipation, and include stock from Washington, Oregon, Montana, Wyoming, Colorado, Arizona, New Mexico, as well as from all over California. The stock buildings are about completed and the track and

grounds are ready for the reception of exhibits. The poultry and pet stock show will be held under tents, and the horse show will be given afternoons

on the track between racing events. Mr. Thomas is more than enthusiastic now that the preliminaries have all been arranged.

LEADING HERD OF THE STATE.

My stock is the result of nearly 40 years of careful breeding and selection. Have for sale a carload of registered bulls and a carload of heifers—1917 calves, grandsons and granddaughters of Beau Donald 31 No. 109885 and Mr. Perfection No. 215575.

They will go quickly. Write or call at once.

Wm. Bemmerly - Woodland, Calif.

the lowest record, this being \$500 for a cow with a record of from 400 to 450 pounds butterfat. As the record increases each 50 pounds the service fee decreases \$50, according to which a cow with a record of 900 pounds or over is bred free of charge. Furthermore, an offer for six months old calves from such service is made to correspond with the record of the mother. For a calf from a cow with a record of from 400 to 450 pounds, \$600 is paid and the amount increases \$50 for each 50 pounds of fat up to 850 pounds. One thousand dollars is paid for a calf from a cow with such a record, but if a cow has a record of from 850 to 900 pounds, \$1,250 is offered for the calf, and if above 900 pounds, \$1,500 will be paid. The records are for full aged cows, and females of younger age with records correspondingly high will be bred at the same fees, and unbred heifers will be bred on the basis of the records of their dams.

Probably you are not in a position to command such service fees, or to duplicate these offers for calves, but think the plan over. Perhaps you can get some ideas from it that will work out well in establishing a reputation for your bull and your herd.

ADDITIONAL PREMIUMS AT THE CALIFORNIA LIVESTOCK SHOW.

In addition to the \$36,000 in premiums at the California International Livestock Show, many breed associations, as well as others, have put up attractive prizes insuring a fine showing of cattle, horses, sheep, swine and poultry. Among the added premiums for the big show which will be held from November 1st to 8th, in the California Building at the Panama-Pacific Exposition grounds, are the following:

American Shorthorn Breeders' Association, for beef classes, \$1500, and \$500 for milking Shorthorns; American Hereford Breeders' Association for beef classes, \$1500; American Aberdeen-Angus Association, \$500; Brown Swiss Cattle Breeders' Association, \$25; American Ayrshire Breeders' Association, medals; Percheron Society of America, silver medals and ribbons; Shire Horse Society of England, silver medals; National Spotted Poland-China Record Association, \$100; Western Berkshire Congress, \$200; Western Meat Co., San Francisco, for Junior Hog Feeding Classes, \$100; American Hampshire Sheep Association, ribbons; The Emporium, San Francisco, for beef and dairy cattle, \$250; California Central Creameries, for best grade cow with record by registered bull, \$225; and 74 cups for rabbit classes.

Entries close in the livestock division, October 1st, except carload steers, which may be entered up to October 18th, and rabbits and poultry, October 20th, and dairy products to 6 P. M., October 30th.

Owners of the Conejo Ranch, Newbury Park, have purchased and brought to the Coast the noted Duroc-Jersey herd of Waltemeyer Bros., Melbourne, Iowa. The purchase price is stated to have been \$16,800. Mr. George Waltemeyer, formerly a member of the firm of Waltemeyer Bros., has been engaged as manager of the swine department of the Conejo Ranch and will have charge of the herds of Duroc-Jersey and Hampshire swine at the Los Angeles, San Francisco, and Portland livestock shows.

Poultry and Rabbits for Profit

CULL TO REDUCE COST.

Many owners of small flocks of fowls, that are kept on farms or in city lots, do not care to make a careful study of the Hogan Method of selecting and breeding for increasing egg production. For these poultry keepers the fall is the time to apply the more simple methods of culling.

In a circular letter James Dryden, Professor of Poultry Husbandry, Oregon Agricultural College, tells how this fall culling may be quickly and easily accomplished. Professor Dryden states:

"A good time to reduce the cost of eggs is now, the month of September, and the way to do it is to cull the poor layers that are eating up the profits of the good layers. It is now possible by looking at the hen and observing certain points to tell whether she is a good layer or not. It is a simple fact, that if the poultrymen had known in the last 50 years what they have learned in the last two years, it would have been possible to have saved several hundred million dollars' worth of good feed. Cull out the non-layers and the cost of producing eggs falls.

The system of culling out the poor layers is the result of a study of trap-nest records of individual hens. This study has shown that heavy egg production is correlated with certain physical characteristics of the hen. It is not requisite that the poultryman trap-nest his flock, but it is certain that no commercial poultry producer can afford to continue in the business and not cull.

The system is founded on the fact that the poor layer discontinues laying early in the season. The good layer continues to lay up until late in the fall. It is a question then largely of knowing how to pick out hens that have stopped laying early in the season, say in August or September.

The test for non-laying are as follows:

1. Shriveled condition of the comb, wattles, and ear lobes.
2. Closeness of pelvic bones, and keel bone.
3. Contracted or hardened condition of the abdomen.
4. Yellow shanks and beak in breeds that naturally have yellow shanks and beak such as the Leghorns and Plymouth Rocks.
5. Molting of the feathers.

If these different points are closely observed there is little trouble in picking out the non-layers. The hen that shows these characteristics not only is not laying but is a poor layer. She has been a poor layer through the year and will be a poor layer in the next year. No single one of these tests, however, is sufficient. For greatest accuracy they should all be considered.

The system then to follow in culling the poorest layers is to do the work in September and cull those that show (a) well developed molting with shriveled comb and wattles; (b) contracted abdomen and dry, puckered vent; (c) yellow shanks and beaks.

To select the very best layers in the flock it is better to do it from October 15 to November 15, as follows:

Take for breeding hens those showing:

1. Incomplete molt, red comb and wattles, and bright eyes.
2. Well-spread pelvic bones, good depth from pelvic bones to keel bone and soft abdomen.
3. Pale shanks and beak and vent, among breeds that have naturally yellow skin and shanks.

To make the test accurate the hen should have had good feeding and care throughout the year. If the hen does not get good care and feeding she may stop laying early though she is naturally a good layer. If, through accident, or mistake, in the feeding a large proportion of the flock stops laying, then the test cannot be very accurately made.

It used to be the theory that the

hen that molted early was ambitious to get the job over early and get ready for laying in the fall and winter, when eggs were high. But the actual fact is just the reverse, as has been demonstrated by poultry investigations in the past two or three years.

POULTRY FEEDING LEARNED FROM NATURE.

The nutriment in the feed of laying hens serves a twofold purpose—to repair waste and furnish heat to the body and to supply the egg-making materials. As only the surplus over what is needed for the body is available for egg production, the proper feeds should be fed in sufficient quantities to induce this production.

In supplying feed to fowls there are three kinds of constituents which should be present in certain fairly well fixed proportions if the desired results are to be obtained most economically. These constituents are mineral, nitrogenous, and carbonaceous, all of which are contained in corn, wheat, oats, and barley, but not in the right proportions to give the greatest egg yield. In addition some animal feed and green feed should be supplied.

In feeding poultry a valuable les-

son may be learned from nature. In the spring the production of eggs on the farm is an easy matter. Fowls which are at liberty to roam find an abundance of green and animal feed on their range, which with grain fur-

nishes a perfect ration for laying hens. In addition to this they get plenty of exercise and fresh air. So far as lies within his power, then, the feeder should aim to make the winter conditions springlike.

Rush Molting Hens Back to Work

THIS year of all years—with egg prices going the highest ever—get a big fall and winter egg yield. Get your hens through molting—when they're all expense and no income—as fast as you can. Get your pullets to laying early and regularly. Yes, get all the profit you can from the high egg prices. Give all your poultry.

Pratt's Poultry Regulator

AMERICA'S original poultry tonic and conditioner, the standard for nearly fifty years. It builds health and strength naturally. It stops losses from the strain of molting. It puts and keeps hens in the condition where a good ration is all they need to lay the biggest lot of eggs you ever got. See if it doesn't. At our risk—

160000 3½ inch Tires per Day

That is the production capacity of Firestone Plant No. 2, devoted solely to this size—the size used by more than half the car owners of America

The true value of the Firestone No. 2 Factory lies in the kind of 3½-in. tires it turns out.

All the floor acreage, the batteries of special tire machines, the carefully chosen and organized workers express themselves in one thing:

A better 3½-inch tire.

The reception given the new Firestone 3½-inch tire proves that Firestone could and did unite resources and volume to produce a quality previously unattainable.

The above are the boiled-down facts of a tire made in quantity so that every

Firestone 3½-inch Special Molded Tire

At These Prices

	Non-Skid	Gray Tube
30x3½	\$18 ⁰⁰	\$3 ²⁵
32x3½	\$21 ⁰⁰	\$3 ⁷⁰

6,000 Miles

one of its mile-giving qualities can be offered at the prices mentioned.

Look at the cross section of this tire at your Firestone dealer's.

From bead to tread, you find sound, enduring construction.

You can see the extra rubber between fabric layers.

You can feel the resilience in the tread. And you sense toughness there, too, in the spring and vigor of the live rubber.

Cushion, breaker-strip and sidewall are generous in size and in the quality of rubber.

Equip your car with these new 3½-in. tires, the latest example of most miles per dollar.

WHITE OR BROWN?

The statement of an Oakland egg commission man that brown or colored eggs are now becoming more and more popular as opposed to the pure white eggs generally regarded as best and drawing biggest prices, is looked on as the opening gun in a campaign to kill off an unwarranted assumption of superiority in the pure white egg. There has been an ungrounded suspicion among egg users that the brown or colored egg is not so good as the white egg and because of its color has been regarded as old stock.

This public attitude toward the white and the non-white egg is particularly interesting when we realize that the opposite view of the desirability of eggs is held on the Atlantic coast. In New York and Boston the public generally prefers the brown or colored egg on the same ground that the pure white egg is preferred here. Back East it is assumed that the brown or colored egg is richer as a food and in the markets one finds buyers insisting on purchase of only colored eggs. Indeed, the pure white eggs are comparatively uncommon back there, probably because the breeders have clung to stock which produces the dark colored eggs.

Very probably there is not the slightest difference in food value in the white or colored egg. If, however, the public will come to regard the white or colored eggs as of equal value then many eggs that are not now salable at a good price would be disposed of without loss to their producers.

Every poultry raiser should make a study of the market demands. A uniform color of eggs and flesh in poultry is desirable. A mixed flock will not produce uniform eggs or meat, and eggs from such a flock are not desirable for hatching.

Our readers interested in the Belgian hare and rabbit industry should send for Farmers' Bulletin No. 496, Washington, D. C.

Do not raise ducks that lay green shelled eggs as the eggs are difficult to dispose of.

Poultry Breeders' Directory

Rate 3½ cents per word each issue.

BOOKING FOR WINTER, SPRING DELIVERY reduced—Hundreds of chicks open most weeks this fall. Seven popular breeds clearing customers \$5 yearly. Greatest profit next year and all found in strains like ours, laying winters and 200-290-egg scores of generations back. Half chicks go to former customers. Doubling our 70,000 hatching capacity. Rejected thousands of dollars for chicks we couldn't supply. **FEW HUNDRED BREEDERS**, laying, younger pullets going rapidly, 50c, \$2.00 underpriced. Circular with proof free. J. BEESON, Pasadena, Cal.

WARDS' S. C. RHODE ISLAND REDS caused a sensation at Sacramento by winning: 2nd cock, 1st and 3rd hens, 1st and 3rd cockerels, 1st and 3rd pullets, special for best-colored female. THE HOME CIRCLE

WHY BOYS LEAVE THE FARM.

Why did you leave the farm, my lad?
Why did you bolt and quit your dad?
Why did you beat it off to town,
And turn your poor old father down?
Thinkers of platform, pulpit, press,
Are wallowing in deep distress;
They seek to know the hidden cause
Why farmer boys desert their pas.
Some say they long to get a taste
Some say they long to get a taste
And some will say the silly chumps
Mistake the suit cards for their
trumps.

In waging fresh and germless air
Against the smoky thoroughfare.
We're all agreed the farm's the place,
So free your mind and state your case.

"Well, stranger, since you've been so
frank,
I'll roll aside the hazy bank,
The misty cloud of theories,
And tell you where the trouble lies.
I left my dad, his farm, his plow,
Because my calf became his cow;
I left my dad—'twas wrong, of course,
Because my colt became his horse.
I left my dad to sow and reap,
Because my lamb became his sheep.
I dropped my hoe and stuck my fork,
Because my pig became his pork.
The garden truck that I made grow,
'Twas his to sell, but mine to hoe.
It's not the smoke in the atmosphere,
Nor the taste for life that brought me
here;
Please tell the platform, pulpit, press,
No fear of toil or love of dress
Is driving off the farmer lads,
But just the methods of their dads."
—Anonymous.

THE BEARS THAT ESCAPED.

Sue pressed her face against the
car window and peered out into the
twilight. During the day she had
enjoyed herself; for what little girl
can help having a good time on a rail-
way trip if she is well and has a kind
mother who understands little girls
as a companion? But, as evening
came on, she began to remember how
far away she was from her old home
and from all her playmates, and she
felt very lonely and homestick.

Her father had been sent to be su-
perintendent in a new factory in a
Western town, and Sue and her
mother were to spend the summer
with him. But Sue did not want to
go. She wanted to stay at home and
have the same jolly picnics and play-
days that she had had the summer
before.

Even the sight of her father's eager
face did not make Sue happy as she
stepped from the train. She cast
critical glances at everything, from
the small frame depot to the last twin-
kling yellow street-lamp that she could
see in the distance.

The long, bare, two-story building
into which they stepped five minutes
later, and which her father explained
was to be their home for the summer,
was worst of all to Sue. It had been
built for a hotel; but, as it was not
just then needed for that purpose, and
as houses were very scarce, it was di-
vided into apartments and rented to
several families. Sue's father had his
office in one of the big rooms down-
stairs. Mother was delighted with the
big, airy room, and began planning at
once where she would put the pretty
things that she had brought in her
trunk to make it "homey" and pleas-
ant. But Sue thought it was bare and
like a barn.

They were to take breakfast at a
hotel near by, but they needed some
things from a store which was only a
few doors away; so, while Sue took
off her wraps, her father and mother
hurried out on their errand.

Voices sounded from the room
across the hall,—childish voices,—and
presently Sue heard a boy call, "Who
let out my brown bear?"

"I didn't," came the prompt answer
in what sounded like a little girl's
voice. Then, in a distressed tone:
"Oh, oh! Mine is gone, too—my nice,
big, cinnamon bear!"

"They were here just before supper,
for I fed them," said the boy.

At the word "bears" Sue shivered
with terror. Bears right in that
house! What should she do? She
was terrified to stay there alone, and
she dared not run out to warn her
father and mother. They were gone
only a few minutes, but the time
seemed like hours to Sue; and, when
they did come back, she was so
frightened that it took her a long time
to make them understand what she
had heard.

Children were running about in the
long hall, so her father opened the
door and called, "What's all this I
hear about lost bears?"

"Oh, they're caterpillars that we
caught this afternoon," answered the
boy. "They were so fuzzy and big
that we called them our bears, and
we had them in two glasses, but they
got out. We'll get some more tomor-
row. Did your little girl come?"

"Yes, here she is. Come in and tell
her about your bears," said Sue's fa-
ther. Sue was so glad to hear that
the bears were of such a harmless
sort that she welcomed with a smile
the bright-faced boy and girl that fol-
lowed her father into the room.

"Mother wants you to come over to
our rooms for a warm supper," said
an older girl, appearing at the door
just then. "You must be tired and
hungry after your long ride."

The new friends were so pleasant
and kind, and the supper so delicious,
that Sue just couldn't keep on feeling
cross and unhappy. By bedtime she
had made so many plans for the next
day that there were not going to be
nearly hours enough in it to carry
them all out.

"We're going to catch some more
bears tomorrow," she laughed, as she
was undressing for bed. "I'm not
afraid of brown bears or cinnamon
ones either."

"They are very useful bears," said
her mother, smiling. "They have
helped to drive off two enemies that
were troubling my little girl,—home-
sickness and discontent."

Sue nodded sleepily, too tired to
answer, and soon she was sleeping so
soundly that she did not dream of
bears or anything else.—Louise M.
Oglevee.

GREEN GRAPE PIE.

Use small seedless grapes that are
about half ripe. Place in a pie pan
with the usual piecrust and sweeten.
Cover with piecrust and put into a
quick oven at first and then moderate
the heat.

PICKLES AND RELISHES.

Sour Cucumber Pickles—Select
small cucumbers, wash, sprinkle with
salt and cover with cold water. Use
one cup of salt to each gallon of
water. Let stand 12 or 14 hours, then
rinse and pack in fruit jars or crocks.
Add green or red peppers, also whole
spices. Cover with scalding vinegar.
If using fruit jars, sterilize and seal
carefully. If stored in an earthen-
ware crock, place a plate with a
weight on top to keep the pickles in
the vinegar, then cover the jar.

For sweet cucumber pickles, prepare
as for sour pickles, adding sugar,
ginger root, horse radish and must-
ard seeds to the hot vinegar.

Chili Sauce—Twelve ripe tomatoes,
one-half teaspoon pepper, three
onions, three green peppers, three

tablespoons sugar, two tablespoons
salt, two cups of vinegar, one tea-
spoon of cinnamon. Peel tomatoes
and onions and chop all vegetables
separately very fine. Combine ingredi-
ents and cook slowly about one hour
and a half.

Pickled String Beans—Remove ends
and strings from beans but keep them
full length. Cover with boiling water
and cook about fifteen minutes; drain,
rinse in cold water and drain again.
Pour over them scalding vinegar
enough to cover. These beans will
be ready to serve in twenty-four
hours.

If you have trouble with the flour
lumping when making gravy, use rice
flour for that purpose as it simply re-
fuses to lump.

DREADNAUGHT
BLAZING-AWAY-IN-COST-DEFENCE!

To Meet Every Need

The demand for a good fast water heater be-
came so urgent that we immediately responded
with our best effort—the result is faster than
that made for city use. The quick action is ob-
tained with our "Super-sixty" Burner, which op-
erates the same as the Dreadnaught for stoves.
The oil consumption is the same, but the heat
greater. A larger drying dome is responsible for
the increase in heat.

We are successfully meeting every demand
where oil is to be used in the making of clean gas
as a means of economy.

This little Burner for cookstoves still leads the
procession with the demand ever increasing. A
raise in price was necessary, but it still remains
the biggest little bargain on earth.

Write for circular—name your need. We will
gladly give details and prices.

Somebody asks "What is tannin?"

Tannin is what they tan leather with—pulls it together, makes it tough.

There's a lot of tannin in oak, hemlock—and in cheap coarse tea, but hardly a taste of tannin in fine tea unless you boil it.

Now do you want tannin-flavor or tea-flavor? Do you want to put tannin or tea into your stomach?

Schilling Tea is the fine practical tea with the real tea-flavor—the most economical beverage next to water.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

CASES FOR SILVER.

Silver that is not in constant use should be kept in cases. These cases may be procured where the silver is sold, but they may also be made at home. Use dark red or gray canton flannel, and bind the edges with braid or ribbons. Use the silver to measure the size of the holders; they must be double, with division lines of stitching, to prevent the silver touching. Make separate cases for knives, forks and spoons and allow extra material for a flap to fold over the top. Roll up and tie with tape.

FOOD AS MEDICINE.

Pills are one of the abominations of the age. The body is abused; the bowels become unable to eliminate the refuse. When this condition has continued to the point of discomfort, the victim takes a pill.

Continued pill-taking destroys the power of the bowels to act without stimulant or forcing. Most of the diseases of women are due to constipation, and yet constipation may be prevented by using the right kind of food.

Traced to its source, constipation is caused by a lack of exercise, lack of bulk in food, lack of water and overuse of condensed foods. To cure this trouble, drink plenty of water, at least eight glasses a day, and take at breakfast a tablespoonful or so bran, or a bran biscuit. Fruits, green vegetables, raisins, prunes, figs and dates are all laxatives. Coarse breads are better than fine white breads. Cream, butter and olive oil are all good. An apple eaten at bedtime is an aid in forming regular habits.

Foods that are constipating are cheese, spices, pickles, nuts, scalded milk, crackers, candy. A meal which is prescribed as a laxative meal is wheat grits and cream, bran muffins, bacon, hot water. To make the bran muffins, take one and one-half cups of bran, one-half cup of flour, one-half teaspoonful of soda, one teaspoonful of baking powder, one-half cup of sugar, one teaspoonful of salt, one egg, one cup of sour milk, one-third cup of melted butter or other shortening, two teaspoonfuls of sorghum. Sift the dry ingredients together. Beat the egg, add milk, melted butter, sorghum and the dry ingredients. Bake in gem pans in a moderate oven until well done.

Prunes soaked for twenty-four hours and eaten without sugar, or an orange, are good fruits for the laxative meal.—Exchange.

NEEDS OF THE HOME VS. THE BARN.

A woman on the farm can make her life about what she wishes it to be, for a great deal depends upon her attitude towards farm life and the work that it brings.

She is an equal partner with "dad" and they should work together. There can be no set and definite lines drawn between outdoor and indoor operations. The improvements that are necessary and can be afforded outside to save time, labor and money, can be afforded and are fully as necessary inside for the same reason.

Any farm that can afford running water to be piped into the barn for the old "red cow" can afford to furnish the house with the same necessity. If the farmer needs a gang plow, the farmer's wife needs a washing machine run by power. The woman is to blame because her home improvements do not keep pace with the outside improvements. She is too willing to keep doing without and using the tools her great grandmother had. Any man is willing if he is financially able to make the kitchen the right kind of workshop for the farm women, but she must study her problem and then both together must determine the greatest needs so that home improvements may be made.

Let us resolve to get away from primitive methods and plan and work to have well equipped, comfortable, convenient and sanitary farm homes. —Colorado Agricultural College.

Today's Dream—
Tomorrow's Reality

Electricity offers to the farmer of the present the means of eliminating the monotonous grind from the day's routine.

G-E Motors Save Labor

You can free yourself from the physical exhaustion resulting from farm drudgery if you use G-E motor-driven machinery to milk your cows, separate cream, churn butter, cut feed and ensilage, saw wood, thresh grain, pump water and perform the many other tasks which make up the necessary activities of the working day. The cost for power is less than the wages of one farm hand. Ask your lighting company or our nearest office for full particulars.

HAY.

Receipts of hay for the past week were 2,893 tons compared with 2722 the previous week. Receipts by rail were very small and over three-quarters of receipts came in from the bay and river sections. Farmers are making every effort to get their hay out of the fields as much hay was damaged last year about this time by rains, and while there are no immediate indications of rain the growers who are unable to ship are trying to get their crops under cover. The city market is slow as most of the big buyers have already laid in their winter supply.

POTATOES, ONIONS, ETC.

The strike of the waterfront men has interfered with the receipts of both potatoes and onions in this market. Outside of this market both are rather weak, especially potatoes, but here, owing to the few arrivals, the market may be regarded as temporarily strong. It is reported that Texas is being flooded with potatoes from Colorado and Idaho at a lower price than that they can be shipped from this State. As that is usually an important outlet for California potatoes at this season the report has materially weakened the market. The waterfront strike has also interfered with the receipts of all kinds of vegetables, but enough have come in on motor trucks and otherwise to keep the market supplied.

BEANS.

No method of distributing the surplus of last year's bean crop in this State has as yet been devised, and in the meantime the new crop will soon be on the market. Already there have been some small shipments and enough is known to assert that the new crop will be of excellent quality, although it is yet too early to predict its quantity.

BUTTER.

Butter receipts continue light. The daily fluctuations have been very small. While some butter continues to go into storage it is practically only that butter for which there was not immediate sale and the withdrawals daily average at least twice the amount sent to the ice house. It is reported that no butter is being shipped to the East from this State, but small shipments of a few thousand pounds are being made almost daily to Central America and overseas.

EGGS.

Eggs continue to advance in price. While no shipments are being made to the East from San Francisco practically daily shipments are being made from Petaluma and other points

of production. On Saturday, September 20, three cars were shipped from production points to New York. These eggs are carefully selected and are eagerly sought in the eastern market. The New York price is about 10 cents higher than San Francisco, and added to that the producer saves the commission charged by the San Francisco merchants. It costs about 9 cents to make the shipment in carload lots so the producer is saving something better than the commission by shipping his eggs outside the State.

FRESH FRUITS.

Gravensteins on the market at present are dead ripe and the price has been reduced to move them. The apple market is expanding and the later varieties are getting the bulk of the trade. Cantaloupes are getting scarcer and sell at higher prices. The berry season is drawing to a close and it is expected that there will be few more berries after the first of October. It is explained that untimely weather is the cause for a shortening of the season this year. The fruit market has been hampered this week by the waterfront strike, but the supply has been ample.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., September 23, 1919.

Shipments of fruits have been seriously curtailed during the past week, owing to the car shortage that prevailed in all districts, and though Eastern receipts were moderate, fruit selling at good prices, buyers were aware of the light supply enroute, which resulted in active bidding and a strong market.

There has been a noticeable inquiry for storage stock pears but a large percentage of the Bartlett from Northern California arrived in the East showing ripe and unfit for storage. Fruit has been moving, however, at good prices, though not as high as the week previous, owing to the quality.

The market for Clingstone peaches, regardless of the sugar shortage, has shown an upward tendency. The offerings are not heavy and the demand is greatly in excess of the supply. Freestone peaches are moving at average prices.

Late plums met an unexpected demand, due possibly to the light offerings of other varieties, the market on all varieties of late plums being unusually strong.

Both Malagas and Tokays are selling at prices nearly as high as the week previous, the demand for Malagas remaining firm, with an unusually strong request for Tokays.

If weather conditions remain favorable for the next two weeks, no serious damage will happen to the grape crop, except that a more liberal proportion should be marketed at this time in the event that rains should set in during the next thirty days.

The very heavy movement of wine grapes has seriously interfered with the car supply and speculation is rife as to what action the Government will take regarding this matter if the shortage continues during the balance of the season.

Averages for the week:
NEW YORK: Bartlett Pears, \$1.68; B. Hardy, \$3.84; B. Clingstone, \$3.78; Winter Nellis, \$3.76; Levi Cling Peaches, \$1.86; Orange Cling, \$1.75; Phillips, \$1.52; Salways, \$1.38; Muscat Grapes, \$1.82; Malagas, \$2.16; Tokays, \$2.60; Thompson Seedless, \$2.00; Zinfandel, \$1.82; Alicante Bouchet, \$2.27; Gros Plums, \$2.05; Grand Duke, \$1.75; Giants, \$1.48; Hungarian, \$1.69.

BOSTON: Tokay Grapes, \$2.70; Cornichon, \$2.15; Muscats, \$1.76; Zinfandel, \$1.82; Malagas, \$2.32; Alicante Bouchet, \$1.88; Salway Peaches, \$1.12; Bartlett Pears, \$3.70.

CHICAGO: Muscat Grapes, \$1.42; Tokays, \$2.15; Zinfandels, \$1.52; Malaga, \$1.92; Thompson Seedless, \$1.81; Black Prince, \$1.57; Hungarian Plums, \$1.65.

Special Livestock Market Report

San Francisco, Sept. 24, 1919.

CATTLE.—There has been little change in the beef trade, and the tendency seems to be toward lower prices. The supply is rather plentiful, and buyers are exacting as to quality and bearish as to price. There is no change in quotations.

AGRICULTURAL NOTES.

Austria recently made an urgent demand for 20,000 tons each of beans, peas, wheat and rice, according to the U. S. Bureau of Commerce.

The Imperial summer crop of milo maize has been moving rapidly at a ruling price around \$49. Probably two-thirds of the crop has been sold by growers.

Kern county has reduced her bean acreage of 500 last year to 100 acres this year, while wheat acreage has increased by 10,000 acres over last year as has alfalfa.

The sweet potato dehydrator promises to solve the most difficult problem of the grower—saving his crop so that people can eat "sweet" throughout the year without cellar losses.

Rice growers in the north are making an effort to have the Bureau of Biology prosecute violators of the duck-shooting rule rather than have a blanket order issued rescinding all permits.

E. L. Maddox, near Sacramento, two years ago put one ton crushed limestone to the acre on his olives and almonds and is so well pleased with the results that he is going to use two tons this year. He states the young trees made a better growth and the soil was much more friable.

Six hundred and fifty acres of barley on Union Island has yielded some 22,000 sacks of grain this year—an average of 35 sacks to the acre. The Delta dealt a good hand this year—as it generally does.

Rice growers in Sutter county are being advised to store their straw instead of burning it. It is said that rice straw can be used in the manufacture of insulation and a company is investigating its possibilities.

Imperial valley has answered the world's call for bread in a substantial way. In 1916 her total wheat acreage was 1906, while this year she has in 37,288 acres! The estimate is placed at 30 bushels to the acre.

Turlock growers of Egyptian corn are rather disappointed at prices on the new crop, which opened around \$58 a ton with light demand. The quality is excellent and this seems to be a chance for the chicken men to get busy.

A total cotton production of 11,230,000 bales is forecast by the U. S. Bureau of Crop Estimates for 1919. The production last year was 12,040,532 bales. Cotton picking is proceeding in Texas, Alabama, Georgia and Florida.

A. E. Imbler at Delano (Kern county) obtained 720 pounds of No. 1 onion seed from 1.6 acre test plot. He contracted this to a seedhouse at \$1.25 to \$2 a pound, depending on market. At the minimum price this would yield \$500 an acre.

There is a 1200-acre field of corn on Union Island (San Joaquin county) on the Old River Farms Company's land. It stands 12 feet high and promises a very heavy yield. This is probably the largest field of corn ever grown in the West—nearly two sections.

The Cudahy Packing Company was fined \$2,300 at Milwaukee for violating the food law pertaining to the storage of food. District Attorney W. C. Zabel said the company had stored 800,000 pounds of meat for over a year without notifying the dairy and food commission.

WANTED TO LEASE by experienced man, established income place, orchard, stock or general farm. Box 1680, Pacific Rural Press.

MALTHOID and RU-BER-OID READY ROOFINGS

Good ready roofings consist of felt, saturated and coated with waterproof materials.

Sun and rain, however, are respecters of neither persons nor things, and the continued protection afforded by any roofing—its lasting ability—depends absolutely on the quality of the materials that go to make it.

That is why we maintain our own refineries for turning out saturating and coating compounds of the quality needed to make Malthoid and Ru-ber-oid Roofings long-lasting.

Pictured above are some of the huge stills used for this purpose. Crude oil is carefully distilled by a special process which retains the natural life and vitality of the asphaltic residues. These residues are then scientifically combined into highly waterproof and sun-resisting compounds.

Tough, long-fibre, wool-and-cotton felt, made in our own mill, is first saturated and then coated with these special compounds, to make Malthoid and Ru-ber-oid Roofings—all under the care of experts, and with the most modern machinery.

We have been making ready roofings for 35 years. We are particular about quality because experience shows that quality roofing is the only kind that will not rot or dry out, and that is fire-resistant. Malthoid and Ru-ber-oid are therefore economical to use on barns, homes, sheds, shops, garages or factories. The price is higher, but the cost is less.

THE PARAFFINE COMPANIES, INC. San Francisco

EACH THE STANDARD OF ITS KIND

When Time Counts

—when lost minutes mean lost dollars—many and many a man has learned to appreciate the real value of good tires.

An emergency—a quick trip to town and back!

That's when you want to be *sure* of your tires—sure they'll carry you there and back without trouble or delay.

United States Tires are noted for their dependability—the

hundreds of *extra* miles they give—their unusually low cost per mile.

And there are United States Tires for every need of price or use. *Five distinct types in all.*

No matter what car you drive or what roads you travel, the nearest United States Tire Sales and Service Depot Dealer can supply you with the tires you ought to have to meet your individual needs.

The June Drop of Oranges in Tulare

Written for Pacific Rural Press by D. J. Whitney.

ONE OF THE BIG TROUBLES that keeps the citrus grower in Central California (and elsewhere) interested and alive to his business is the June drop, which is very much in evidence at the present time, after the middle of August, in spite of the months it is named after. Formerly the orange grower in this section seemed to be mostly interested in a location where he could dodge frost, or in the race to get his navels to market before the frost spoiled them. Now the main puzzle seems to be how much, or little, fruit the June drop is going to leave on his trees. The June drop is a pleasant thing to write about—one can guess so many things about it and yet be safe, because so much and so little is known of its cause. If any man proves your guesses wrong, you can retaliate by proving his guesses wrong also.

Persistence of the Drop.

Tulare county thinks this problem so important that she has secured an expert plant pathologist to study the subject. When he has completed his work we doubtless will know more, but doubtless the drop will still be with us. The plain, simple facts of the matter are that a great deal of the fruit of a Washington navel tree is due to drop in early summer. This, that, or the other thing is recommended to check it—but drop, drop, it goes anyhow. Groves of ideal condition, which are given ideal treatment for all that can be seen, very naturally set more and finer fruit than common groves, yet a lot of the fruit drops off anyhow. Every little helps and makes the good grower more successful than the poor grower in the value of the final crop, but until something radically different than common sense and experience seem to suggest, the June drop apparently is a condition that will have to be faced. Harvests have come and gone and money has been made in the face of it, so the industry can still endure and prosper in spite of it all.

Drop Outruns the June Period.

The thing of special note for the summer of 1919 is that the June drop did not quit in June. It used to be thought that an orange reaching the size of an overgrown marble was safe, but this season they are dropping when nearly half grown, and dropping on good groves as well as poor ones. There will be no crop failure, but the extremely good prospects of spring are far from as good now. May rains and a cool, early summer, followed by high heat later, is sometimes blamed for it.

Now for details. The drop in citrus fruits is limited essentially to the Washington navel. Some Valencias and other seed varieties will drop, just as prunes will drop, but serious injury to the Valencia crop is not common from this cause. Consequently, the guess is made that pollination has something to do with it. However, for all that can be seen, navel trees near Valencias or common seedlings seem to drop as badly as other navels. The sexual parts of a navel orange are defective, and very rarely could the finest pollen in the world get into action, so it does not seem that the solution is here.

More to the point is the fact that the navel, being seedless, therefore unnatural, artificial, and a freak which Nature has no use for, is naturally more high strung and freakish in habits than a normal fruit, by which term is meant, a fruit that is pollenized and sets seeds the way Nature originally intended all fruits to do.

Proper Irrigation.

Fundamental in importance in making good fruit is irrigation. It has been proved time and time again that when a navel tree suffers for moisture the fruit is robbed by leaves and twigs and drops off easily when irrigation supplies the next good drink. A year ago this explanation was the great explanation. It is a good one to the extent that an orchard irregularly irrigated will have a heavier June drop as a rule than a properly irrigated orchard, but nevertheless the drop will continue with groves given the most careful irrigation possible, which never, for all that can be seen, have a deficiency of moisture, and never have an excess of moisture. We can therefore rule this out as a very vital guess, and mark it down as merely a step in keeping a grove in good condition, knowing that a well-cared-for grove will hold and mature more fruit than a poor one.

Permanent Cover Crops.

Another great big guess as to the cure of the drop was that permanent cover crops, like alfalfa or sweet clover, would provide moisture in the atmosphere, thus preventing the strain of hot, dry air on the small fruit, but last season in Southern California, when the atmosphere was a little more humid than usual, the oranges seemed to drop faster than usual, the cause for that year being guessed as bacterial action, induced partly by more than normally humid conditions. A rule that the weather is likely to start working backwards has serious faults. This permanent cover crop idea, or failing in that, the summer cover crop idea, seems to have lots of good features. In many cases by adding strength to soil and trees, it seems beyond question to give a heavier set of fruit than the orchards had before. However, proper fertilization, irrigation and cultivation do just the same thing. There is nothing that will justify summer cover cropping in being considered more than an item in helping trees that need this kind of care.

Spring Plowing.

"There is too much of a shock to the trees by cutting off the small feeding roots in spring plowing," say some, "just when the bloom is on, or about to come. The tree needs all its strength at this time

to give the fruit a fair start." True enough, as far as it goes. The right combination of soil handling in the spring helps a great deal in the amount and quality of the crop harvest the next fall and winter. To that extent it makes the fruit stick, just the same as good irrigation, fertilization and everything else makes the fruit stick, but the June drop goes on just the same on orchards given every kind of soil culture that the experts can suggest. What we are trying to say in this line is this: Every little helps. All of the good advice given relates to ways of making the fruit set in general, and good trees are normally going to set more fruit than poor ones, but in spite of everything the June drop continues on good groves as well as on poor ones.

Some persons are becoming quite convinced that the thrips is extremely guilty; that practically every fruit of more than normal dropping size (everybody admits that the loss of a certain portion of the fruit in spring is natural and inevitable), which drops off when it apparently should stay on, was injured when younger by thrips. Actually this theory has the same basis as the others—that something has weakened the fruits and so they

(Continued on page 448.)

Vigorous young trees, as strong and thrifty-looking as this, are not exempt from "June drop" of the fruit.

SAVE CALIFORNIA'S CROWN!

WHETHER the forest fires of last month were actually greater and more destructive than is normal for September we are not sure, but that they were more widely spread and encroached more deeply into public attention and apprehension is probably true. Probably Mr. Du Bois, who has charge of our district of the national forests, and Mr. Homans, our California State Forester, will tell us ere long how this year's experience stands related to their systematic work for fire-prevention, and what may still need to be done to render preventive efforts more efficient. It is surely a great question, and it will naturally become greater in importance as we proceed with the development of homes and industrial establishments in the vicinity of forested areas, which we must learn to safely retain. For we have no idea that we must denude our State to free our achievements and investments from fire-menaces. We wish all coming generations of California to live in a State ever glorious and famous for its trees—resting in their shade and lifting their aspirations above the tops of them; or, as Longfellow had it:

Enter! the pavement carpeted with leaves
Gives back a softened echo to thy tread!
Listen! the choir is singing; all the birds
In leafy galleries beneath the caves
Are singing! listen, ere the sound be fled,
And learn there may be worship without words!

MUST RAIN BE THE BEST FIRE FIGHTER?

The fire fighters did nobly! Out they went by thousands from all haunts of men, braving all perils to protect and preserve the attainments and requirements of civilized life. On many places they won their battle and subdued the flames in the face of wind and measureless areas of inflammability. And yet, in spite of all the human science of fire-fighting, they seemed here and there to be on the edge of defeat—until Nature sent her own forces to their assistance. It is, of course, no impeachment of man's efforts for prevention and conquest of fire that the rains saved wide and rich areas of Southern California from great losses and prolonged distress: it is only a sharp warning that we must make our science of fire-fighting broader and more exact, and our practice of it more efficient, and that we must provide more liberally for both in our national and State expenditures. Our lesson, then, is one, not of humility alone, but of greater, more systematic and efficient effort. We have been saved from great losses, not for later destruction, but for struggle more creditable and commensurate. We are compelled to acknowledge that it was a higher power than our own which saved us—saved us, not to loll in a sense of security, but that we might better learn to protect ourselves. It was an intervention which we have no right to expect, because we are endowed with intelligence and power to save ourselves. And yet, we have to admit that, in spite of all our attainments hitherto, rain is a fire fighter beyond the present powers of man to emulate. Shall we always thus remain dependent, for the safety of our civil-

ized attainments, upon the intervention which Nature employs to preserve her own wild life and substance from utter destruction? Such a thought is not only an impeachment of man as a creature, but of his idea of the wisdom of his Creator—for man's idea of both was earliest recorded in these words: "Let them have dominion * * * over all the earth and of everything that is upon the earth." If we insert the word "creeping," which the translators supplied, it does not really limit the assignment. The earth was given to man to do whatever he could with it, and if he should allow the forces of Nature to destroy even every "creeping thing upon the earth," he would be recreant and responsible. When the Supreme Council made Man mandatory of the Earth and the contents thereof, it was surely no call to passivism!

HOW THE RAIN CAME.

The record is most dramatic, thus:

Los Angeles, September 27.—Thursday night the people of Pomona gathered in churches and offered prayers for rain. They were prompted by the announcement that rain was the only thing that would stop the devastating forest fires in that vicinity. Last night their prayers were answered. Well before midnight the heaviest rain for this season of the year that has fallen in Southern California for many years, began. It continued throughout the night. Reports from the forest fire region early today were that the rain was rapidly quenching the last strongholds of the fire.

Of course, the most obvious and important aspects of the foregoing sequence of events are transcendental, but, as we hold no commission in sky-pilotage, we cannot elucidate them. There is, however, quite enough within range of a secular shot to warrant a cartridge or two. For the sake of the spirit of man, which since the war has become quite freely secularized, it is much better and more rational to pray to God Almighty for rain and to believe that you get it by praying than it is to appeal to and place faith in soothsayers, clairvoyants, weather-prophets and rain-makers, who hasten to do evil that goods may come to themselves. We hear from all sides, as a teaching of the war, that man must become spiritualized by forsaking his worship of self and other material affairs, and it is unquestionably true—but if he swap seven devils for one by satisfying his soul with spiritualistic fallacy, vapidty and deceit, his last state will be worse than the first. It is true, of course, that we are more in danger of making such exchange in our social and industrial affairs than in our meteorological transactions, but the lesson is the same. It is much safer to carry our social burdens to the church than to the soap-box—still considering them both as merely secular institutions.

And another affair of the spirit has arisen from the war, and that is what is called morale. American morale must be continued in us as it was engendered in our fathers by devotion to the highest things which inspired patriotism, industry and true humanity. The Pomona people did well; they exalted their spirits; they uplifted and strengthened their morale; they put out the fire! There is an efficiency in spiritual affairs—from a secular point of view at least.

FARMERS LARGELY OUT OF IT.

And so the great conference between employers and employed will come on in Washington on October sixth, with scant participation by agricultural employers. It is true that in the list of twenty-two patriots appointed by President Wilson to "represent the general public," there is an agricultural editor from Iowa (who may be counted a near-farmer); the president of the Ohio Farm Bureau (whose relation to practical farming may be either actual or academic); and one man from Carbonate, Colorado, who is really put down as "a farmer"—and we accept him as such with proper gratitude, though from his residential sound he may be cousin to a coal mine. Supposing we accept these three as agriculturally representative, as doubtless they are in different ways, why should we complain? Well, it is this way: Farms in the United States in 1910 were worth forty-one billions of dollars—two-thirds lands, one-third buildings and equipment. This property was operated for food production by six and one-third millions of farmers directly employing or keeping busy a rural

population of forty-nine millions, or fifty-three and one-third per cent of the population of the United States at that date—losing sight of the fact that the remaining forty-six and two-thirds per cent of the population was considerably employed in manufacturing for and otherwise serving the six and one-third millions of farmers who are employers. Now, when the president of the United States appoints twenty-two representatives of the "public interest" to take part in the discussion of the relations between employers and employees, he decides to name three who are more or less representatives of agricultural employers and nineteen who are representative of everything else in the United States, all the way from trust-magnatism to socialistic propaganda—less than one-seventh to represent more than one-half of the population and more than six-sevenths to represent the opinions and interests of the other less than half of the population.

It is true that agriculture will have larger representation when it is considered that a number of those who are appointed as financiers are also large owners and operators of farming lands, and may do much to support the agricultural view of the current condition of affairs, but their agriculture is apparently incidental, and their appointment is credited on the published lists to their preponderating interest in other affairs. In our notion, agricultural representation should not be incidental. To whatever number may be considered feasible to appoint farmers to represent the public interest, the incumbents should be real producing and employing farmers, whose farming industry predominates in their industrial affairs.

Aside from those appointed in the "public interest," farmers may appear as delegates from agricultural associations, but the number so far announced is pitifully disproportionate. In these tests the representatives of organized labor seem to number fifteen, while representatives of agricultural associations do not exceed five. Two things are possible: other representatives may be named later, or those in authority may not find country-wide associations enough to name a larger number. The agricultural importance of the affair seems to be problematical.

CALIFORNIA DEVELOPMENT.

California is full of people, and a larger than the usual throng of winter residents is coming, the touristologists say. Everybody seems to be running about trying to buy something large to irrigate it, plant it—for the sake of its production, or to cut it up and take out the unearned increment later. In growing towns inclosed by large areas of improvable lands, it seems to be nip and tuck to get a nap even by night. It is reported from Fresno that a reputable family found itself cosily lodged in the county jail because they accepted entertainment from an enterprising hotel keeper who said he had "only outside rooms." The long, dry spell seems to have emptied the jails of their regular occupants and increased our hotel capacity. These well-protected domiciles may be in demand by those who shrink from the attentions of real-estate agents. But on the whole, our own people and our visitors seem to like the game of buying, ditching, planting and cutting up. One of our metropolitan banks has been buying branches nearly everywhere, and advertises that it is ready to finance a lot of farming. A prominent metropolitan mortgage company, which has formerly largely confined its activities to such trifles as municipal bonds, now announces by circular:

Investors seem to favor loans on good income country property, and following the inclination of investors, our company is devoting much attention to loans of this character. There seems to be nothing in the market more substantial than farm lands during the situation of the country at this time, and there is every reason for the feeling of security on mortgages secured by land."

Just think of it: these are the very people who a few years ago would rather put tens of thousands in a suburban site for a brickyard than a few hundreds in the deepest loam the country afforded. They have had an awakening. The Federal Loan Banks and their gilt-edge bonds have surely put them wise as to what investors consider desirable and secure.

We are receiving from Eastern agricultural economists very interesting essays on the economic danger of farming lands rising too high in price.

Many of their postulates seem well drawn. They might be of some influence if addressed to buyers, and they should have weight in the case of a farmer who wishes to go on farming, for to such a man a rise in land values, will mean more cost in the way of taxes, etc. But such an appeal to keep prices down to a land owner who has long wished to sell, is like asking a small boy to refuse an ice-cream ticket for fear of giving his grandmother a chill. Besides, good California land, with a climate over it, is really in a class, by itself—from the point of view of variety and volume of production. Everybody seems to be wanting good California land, and some of them may get what is not as good as it ought to be for the money they are paying for it, but there is no comfort in dissuading them. Most buyers will get the worth of their money, and California is the place to do it.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

A Cure for Wormy Wicksons.

To the Editor: Why are the Wickson plums so wormy. I am a new comer and they tell me that the Wicksons have more or less worms every year. If that is the case there must be a cause and some remedy. Please explain.—T. G. L., Auburn.

The worms you speak of are the larvae of the "peach moth" or the "peach twig-borer" (*Anarsia lineatella*). The way to head off this pest is to spray the trees, just as the buds begin to swell toward the end of winter, with lime-sulphur, diluted 1 to 10. Be sure to cover the rough bark in the forkings of the branches, etc., for it is there that the larvae hibernate and you have to catch them as they emerge. The fruit is bored at the stem end by the worms of a later brood, but the way to get them is to kill their possible parents.

Rooting Mulberry Cuttings.

To the Editor: I planted some mulberry cuttings from good, well-developed, young wood. Most put out leaves until the size of a half dollar, then slowly died. They had plenty of water. Should they have been packed in damp sand or what?—C. C., Simi.

You do not give information enough. If the cuttings were soft wood (that is, green wood of current season's growth), they probably had too little heat. If they were hard wood cuttings (that is wood of the previous year's growth) they probably had too much water. If they had (in either case) been inverted to damp sand, so as to bring the bottom of the cuttings just below the surface of the sand so that a callus had been formed, they would probably have developed roots before they made leaves, and that is what is necessary in starting a cutting. After callusing they should, of course, be planted right end up.

Certified Seed Potatoes.

To the Editor: Under the requirements of the new potato certification law may I plant my potatoes on my own land and sell the product for food and use as much of it as necessary for re-seeding the next year and keep on doing so, selling for food only each time, without having certified seed?—L. C. M., Valley Ford.

Seed potato certification does not interfere with your doing your spud business as usual if you choose to. If you try to market diseased or infested potatoes, you are liable to condemnation by other laws and regulations. The seed certification law is simply for the purpose of making it sure that planters can get seed of good type, well grown and free from pests—if they desire such seed. It is hoped that all planters will have that desire and find it profitable to indulge in.

Better Early than Never.

To the Editor: I have an old apple orchard that has not been pruned or plowed for five years. The trouble is that I have to depend on my neighbors to plow it and they have their own work to do when mine should be done and the ground is too dry to plow when they can do it. Would it do to plow it this fall after it has rained enough so I can plow it, and can it be pruned as soon as the apples are picked?—Farmerette, Santa Rosa.

Surely: go to it this fall, both in plowing and pruning. Plow up the land rough and let it lie as late as you can, and then have it well harrowed down before your neighbors' land is dry enough for them to plow—for a few windy spring days will fix your rough land to carry a harrow while

theirs is still in the wet. Of course, your example may teach some of the rest of them that fall plowing is a good thing (except on hill land too apt to wash in your heavy rainfall), and this may make them too busy to plow for you in the fall—but you have to take your chances of that.

Pruning Cut-Back Bartletts.

To the Editor: I wish to know about what pruning I should do this winter on Bartlett trees 18 years old, which I sawed out and cut out heavily last fall and now have plenty of young growth. How shall I prune for a medium-sized crop?—J. W. T., Healdsburg.

It is hard to tell without seeing. If you have a stub-growth of rather short shoots thin them out so that those you leave will have a chance to develop leaves and fruit spurs. If you have also short shoots well scattered on old branches, let them alone. If you have long shoots going skyward cut them back—say one-half on the average. Always cut back to a side shoot if you can; if not, cut back anyway and force out laterals nearer the earth. There is not much danger of your getting more than a medium crop next year if you really cut back last winter, as your description might indicate.

Sorghum Silage.

To the Editor: I have ten acres of sorghum which I wish to put in my silo, and having had no experience, I wish to know how much salt, water, etc., to use and how much tramping.—L. W., Perkins.

Sorghum should be siloed when the seed is ripe—later than corn. Green sorghum silage develops a very sharp acid. As the stalk remains green longer than corn you can wait until the seed is ripe and still have the stalk in good condition. Cut into the silo in half-inch pieces. Spread and tramp thoroughly—even tamping can be done to advantage. No salt is necessary, though many use a little sprinkle for their own peace of mind rather than because the stuff needs it. Water is used according to the dryness of the stalks. There can be no exact rule for one has to use judgment according to the condition of the stuff he is cutting in. If very dry, it should be thoroughly wet, but not to get much run off.

The Danger in "Firing" Sorghum.

To the Editor: I have 140 acres of barley stubble on which I am going to turn 300 head of cattle. Adjoining the barley there is 20 acres of white Egyptian corn, which has not had enough water and is "firing." I am told this firing corn is poisonous to cattle. Can you tell me if this is so?—S. J. G., Pixley.

To the Editor: Will it injure milk cows to pasture them in a field of sorghum that does not head out, owing to being too dry? Would like to turn them in part of the time and let them eat it, but am told it is injurious to cattle in this stage. Kindly let me know.—H. S., Ripon.

The only danger we know of in feeding "fired" or drouth-perishing sorghum lies in the filling of the over-hungry animals with indigestible material, which may be serious. If they are fairly fed they are not likely to take more of it than they can dispose of. It is not dry sorghum which is actually poisonous. Poison is only developed in very rank growth of green sorghum—which is apt to come after cutting a crop from stubble which has moisture enough to make rank growth.

Feeding Cull Raisins.

To the Editor: Having an opportunity to get raisins unfit for table use because of being broken or crushed, at \$35 per ton, I desire information on the feeding value of these for hogs. Could one get equally good results as from barley, in fattening hogs for market, provided the raisins were soaked? If not, would the raisins still be cheaper fattening feed because of the difference in price? Would they tend to produce a scouring condition?—Subscriber, Ojai.

Professor Jaffa concluded some years ago by analysis that cull raisins were practically equal to barley weight for weight, and subsequently Professor Woll announced that "raisins that are not marketable will make an excellent feed for fattening hogs if they do not make up over one-half of the grain ration; fed more heavily they are likely to cause scouring and will produce unsatisfactory gains. According to experiments at the University Farm, raisins fed as stated possess a similar feeding value to barley." You must therefore feed raisins with grain half and half and provide pastur-

age or other succulent food also to get the best results from raisins.

An Irregular Grafter.

To the Editor: Can I graft the peach on the French prune? What will take persimmon graft? After digging out cherry trees infected with root-knot would it be safe to plant French prune on myrobolan in the same place? There are several silver prune trees in my French prune orchard that I grafted to French last year. They seem to be doing nicely, but my neighbor tells me that they will die after the second year. If this is true I will save time and get them out now.—Reader, Napa.

It seems necessary once in a while to answer an anonymous querist simply for the purpose of reminding readers that we have no respect for a communication which does not give the full name and address of the writer. We seldom use full names, but we must have them.

You can plant in the place of the cherries as you propose. Dig or blow out the stumps: dig a large hole, scattering the contents over the surface, picking out and burning all root fragments; lime the hole and let it lie open; refill with fresh soil at time of planting the trees. We should keep the grafts on the silver prunes. They are by no means sure to fail. Persimmons can only be grafted on persimmon wood. The peach will grow on the French prune, but we should not consider any considerable operation in that line desirable.

Avocados in the San Joaquin.

To the Editor: How about avocados for the San Joaquin valley? Do you think one would be wasting his time in trying to grow them here in this climate? What measures would you recommend one to use in trying to coax them to live with us here if this climate is not suited to their best interests? I see that the Fuere, a Mexican variety, is recommended for planting in the northern part of the State, on account of its hardiness. If it would grow here, would one be justified in planting, considering the market standpoint?—D. E. C., Reedley.

The last time we were in Visalia we saw an avocado tree about thirty feet in height and spread, which the resident of the house-lot in which it is growing reported to be productive. It looked as though it was not less than twenty years old. We judge you need not apprehend climatic danger to any of the hardier or thin-skinned varieties, and the San Joaquin Valley has as good a chance with the thick-skinned or more popular commercial varieties as have many other sections where they are being planted. It is surely enterprising for planters to try them out; that is the only way to determine the facts. As for coaxing them to live in unsuitable regions (after that is determined), we should not do it, and as to an opinion as to the future commercial chances with the fruit we have none. That, also, has to be determined by experience.

California Weather Record.

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending September 30, 1919.

Stations—	Rainfall		Temperature

California Sugar Beet Markets Are Busy

Written for Pacific Rural Press by R. E. Hodges.

ABOUT 225,000 tons of sugar beets to be sliced at the factory, which will put out more sugar than any other in the State—that of the Spreckels Sugar Company near Salinas in Monterey county. This is about ten per cent increase over last year's tonnage for this factory, according to Resident Manager C. L. Pioda, but it is far short of the tonnage expected next season. The factory will take beets from about 30,000 acres, of which about five-sixths are in Monterey county and the rest in Santa Clara and San Joaquin. In the latter county the Manteca factory will not run and probably the Tracy factory will not operate this season. The average tonnage per acre is light, due to blight in southern Monterey and the San Joaquin districts. Due to this, the general condition of the beet crop as a whole is estimated at 75 per cent of normal, but no one would hope for a better crop than is general in the northern end of the Salinas valley, especially where they were irrigated. The Spreckels factory started slicing early in September. The early beets are said to be lowest in sugar, but the first week's tests averaged over 18 per cent.

Beet Laborers Scarce.

A particular shortage and inefficiency of beet labor is reported. Some of the expert Japanese beet toppers are making over \$10 per day, Japanese being the best beet laborers available, when under adequate supervision. But Mr. Pioda suggests that while they enjoy the protection of our laws and the benefits of our schools, they ought to help pay the taxes; and the best way to accomplish this is to levy on them an income tax about four times as great as that levied on American citizens.

More Tractors Being Used.

A progressive movement is noted in the greater number of tractors used to plow and prepare the deep seedbeds necessary for beets, but motor cultivators have not yet been tried out here. Tractors are being used to haul wagon trains of beets out of the fields to nearby unloading stations. Where a long haul is necessary motor trucks have proved economical. One man in Santa Clara county hauls a truckload of beets out of the field, then pulls a trailer load out by horses and hitched it to a truck for a 3½-mile haul on the road.

Beet Topper-Digger Needed.

A great deal of hand labor could be saved in topping beets by use of one of the several mechanical toppers now on the market. One of these is being tried out on the Spreckels ranches. Another has been tried and found unsatisfactory. But they all top the beets without digging them, and thus deprive them of the natural handles (the leaves) by which they are pulled out after the digging machines have loosened and partially raised them. On adobe ground it is hard to get them out without the leaves.

Patents are being issued all the time on various devices tending to bring about the much-desired combination topper and digger, and a fortune is awaiting the successful inventor.

At Betteravia in Santa Barbara County.

Beet plowing for the Betteravia factory, which uses the crop from about 8,000 acres in Santa Barbara county began August 4 and the factory started to run August 11. By their closing date, which will be around the first of December, Manager H. S. Truscott estimates that they will have cut over 100,000 tons of beets. These come largely from the lower end of the Santa Maria valley, but a great many come from Lompoc Valley, Arroyo Grande, and Los Banos Valley. The sugar test has been running

SUGAR-BEET ROTATION INCREASES ALL CROPS.

Sugar beets were responsible for the long duration of the European war, says Manager H. S. Truscott of the Union Sugar Co. at Betteravia. Without sugar beets and the increased yield of other crops due to rotation with sugar beets, and the better cultural methods of farming which were developed as a result of sugar-beet raising. Germany could not have supported her population of three-fourths as many people as live in the United States on a territory less than the size of Texas during the years when the blockade threw Germany on her own resources for food. German farmers in 1909 harvested 3,000,000,000 bushels of wheat, oats, barley, rye, and potatoes from 42,000,000 acres, while American farmers harvested but 2,300,000,000 bushels from 92,000,000 acres. Germany on old soil produced a great deal more than twice the yield per acre that Americans produced from relatively virgin soil. Credit is largely due to rotation with sugar beets and the lessons learned from it.

Wherever in the United States sugar beets have been grown in rotation with other crops, the acre yields of all the crops concerned have been greatly increased, often exceeding the German yields.

In California, such rotation has been gaining favor recently. "This company has had easily twice the returns from cereals after sugar beets," says Mr. Truscott. "Then after the cereals, our beets have produced two or three times as much as they had previously, especially where they had been grown repeatedly without change."

Agricultural Superintendent G. E. Benschel of the Oxnard factory of the American Beet Sugar Co. points out a notable progressive tendency among bean and beet farmers who previously have not rotated. Some of the best bean farmers who have refused to grow beets heretofore did so last season. In this they have already been quite fortunate aside from the benefits of rotation, in that the average beet crop is much nearer normal than the average bean crop, and the market is assured at profitable prices.

around 18 and 18½ per cent. The factory, which had a capacity of about 1,000 tons of beets per day last year, has been enlarged to take care of 1,200 tons a day this season. The Union Sugar Company, which operates this factory, raises on its own property about three-fourths of the total crop used, and pays contract growers \$10 per ton flat rate. The same price

will receive \$12 per ton for 15 per cent beets and \$16 per ton for 20 per cent beets. The first payment to growers is \$10.25 per ton on delivery, the remaining payments being made as conditions warrant.

Tractors are quite generally used here in preparing seed-beds and a great many are used in pulling beet diggers. The old cable outfits by

Plowing a beet field in Los Angeles county.

The 6-mule team and the tractor do equal work.

is proposed for next year, and prospective acreage is on a par with previous years.

At Oxnard in Ventura County.

The Oxnard factory of the American Sugar Company began its run August 9 and is expected to close about October 12. Over 5,000 acres had been cut before the middle of September and the average sugar test had been 20.54 per cent, according to Agricultural Superintendent G. E. Benschel. The total acreage to be harvested for this factory is 15,837, but the yield is light on account of lack of rain and no irrigation. Mr. Benschel estimates that there will be about 160,000 tons to slice. Thirty thousand acres, averaging ten tons per acre, would be necessary to run the Oxnard factory to its full capacity of 3,500 tons per 24 hours through a full season. Beets are received here from Newhall, San Fernando Valley, the Oxnard district and the Chino district of San Bernardino county, where the factory is closed for lack of adequate tonnage.

Price Especially Favorable.

The price to growers here is especially favorable, being based on the net price received by the company. For example, if the company nets 9 cents per pound for sugar, growers

which a big steam tractor at each end of the row would pull plows or beet diggers across and back by means of cables are practically all replaced by gas tractors.

Increased Sentiment for Drainage.

A great progressive change in sentiment is noted by Mr. Benschel in the attitude of farmers toward drainage of the lower beet lands. Drainage projects have been voted down previously, but the benefits of tile drainage on the Patterson ranch and of gopher drainage on other ranches have convinced growers of its profitability. The Patterson Drainage District has been organized to provide for ultimate disposal of its drainage water, and three other drainage districts are about to be organized.

Labor Conditions Greatly Improved.

The acute labor shortage which kept the factory running far short of capacity last year is not worrying the management this season. Mr. Benschel ascribes a great deal of the improvement to the policy of providing houses and garden plots for Mexicans. The Sugar Company has put up about 100 such houses and about a dozen ranchers have provided similar quarters. A Mexican likes to have a place he can call home, where he can raise a garden and keep his family. When

this is provided, as at Oxnard, he writes to his many friends and relatives, who also are attracted with the good results mentioned. They are said to prefer adobe houses and there is the advantage that the Mexicans can build their own adobe homes during seasons of slack work. One house for two families costs about \$400. Some frame houses also have been built for the same purpose.

The campaign for next year's contracts has not been started; but prospects are favorable, not only on account of high sugar prices, but also on account of the unsatisfactory bean yield this season, and the unknown future bean market. Since Americans consume about 4,000,000 tons of sugar per year and produce but 2,500,000 tons under our own flag, the market prospects look good.

350 TONS OF GRAPES ON 5-YEAR VINES.

(Written for Pacific Rural Press.)

Last week we met Eph. Light of Calistoga (Napa county) and his son Ed going up on the boat, and asked about this year's crop of grapes. Light & Sons are among the oldest vineyardists and winemakers in the county and have themselves provided a market for many small growers of wine grapes in the past. "We shall have about 1,000 tons of grapes on our 140 acres of vineyard," said Mr. Light. "No, we don't know yet what we are going to do with them. We have a 350-ton crop of grapes on that 40 acres you saw us grafting over three years ago. The vines are large and strong—as vigorous as any vineyard of any age." As we saw this work done we know it will prove of interest to other vineyardists.

Three years ago on the 7th of May a frost came along and swept this vineyard clean. It was the best two-year-old vineyard a man ever clapped his eyes on, all staked and tied. The vines were split by the frost clear to the ground and had to be grafted over.

They are all valuable black varieties—about half Petite Syrah, one-fourth Zinfandel and one-fourth St. Macaire and Barbara grapes on Rupestris, St. George and Lenoir roots, with a few No. 1608. Fortunately, when the frost came the Lights had about 10,000 scions buried in lugs

about two feet deep, and they were in good condition. Ed Light and his brothers and hired men started cutting off the frosted tops and grafting on about May 15 and finished July 28. They obtained a 98 per cent stand, the last grafts inserted showing two or three shorts three feet long by September 1. Some vines that were split to the ground had only a strip of bark next to the stake left alive. This piece of bark grew round itself and healed over with the old heart sticking out at an angle like a hat-peg. No one would ever guess that this peg was once the body of the vine. Ed Light is going to cut one of these vines off and send it down here to the office as a curiosity and a proof of the wonderful vitality of a vine.

Few people can realize how a vineyardist's heartstrings are bound to his vines. Sometimes the sympathy accorded the grower of wine grapes reminds me of how patiently a certain man once listened to a tale of suffering, where a friend had lost his wife and children in one catastrophe, and then he said, "My, too bad—are you going to the races?"

Turlock's huge shipments of melons is over. About 4,500 carloads were shipped, it is estimated, according to the Turlock Tribune.

Latest Developments in Walnut Situation

(Written for Pacific Rural Press.)

The walnut crop of California is safe from all further danger of damage except discoloration from possible rains. The largest crop in the history of the State is about ready for harvest. It is estimated at 46,000,000 pounds this year, according to H. H. Warner, who has left the U. S. Bureau of Markets and joined the Field Department of the California Walnut Growers' Association during the past year. The first car will start East about September 25th from Capistrano, which shipped the first car last year. The present crop is about 7,000,000 pounds greater than that of last year and its quality is as good as it ever was.

Opening Prices October 1.

General Manager Thorpe of the Association is in the East at this writing, but will be back before this is published and will make a detailed report to the Association directors on the market conditions in the East and the crop conditions abroad. This will furnish the basis for Association opening prices, which will be set October 1. Greater importations may reasonably be expected on account of more ships being available. There is keen speculation as to the prices, in view of those set by the raisin growers on their crop being nearly doubled this year. Walnut growers also have encountered increased costs of production, not the least of which has been the unusual amount of irrigation required on account of our previous dry seasons. The Association has been urging growers to irrigate all summer in order to give size and weight to the heavy crop which set. The response was gratifying, and as a result there will be a smaller percentage of Number 2's, although there will be more of the second size than there were last year.

More Budded Nuts.

This year's crop shares the steady increase in proportion of budded nuts on account of young orchards coming into heavier bearing. The differential last year between budded nuts and the Softshells was 3½ cents a pound. That this is justified is shown by Mr. Werner's statement that there is actually 15 per cent more weight of meats in the budded nuts. This has not been entirely realized by consumers who have thought they ought to get budded nuts at Softshell prices.

Walnut Meats in Tin Cans.

Canned walnut meats will be a new departure this year. The demand for meats has been increasing right along and last year's walnut meats were all sold long ago. But while the California nuts are not so oily as those from abroad, and therefore do not so easily become rancid, this year assurance will be made doubly sure and the meats will retain their sweetness indefinitely. This is due to the plan to put up about 75 tons of the meats this season in half-pound "thermo-cap" tin cans. The meats will be hermetically sealed in a vacuum. The machinery is being set up now. The cracking plants at Santa Ana, Goleta, and Los Angeles will begin operations about October 15.

New Growers' Dust-Spray Factory.

Another new move of the Association is to organize a subsidiary corporation, stock in which is held by local and State Walnut Associations, to set up its own dust-spray manufacturing plant in Los Angeles. Prof. R. E. Smith of the University of California, who has been carrying on dust-spray experiments for two or three years at least, has obtained a leave of absence from the University and will manage the new plant. Prof. Smith devised machinery at the Goleta plant for this purpose, and used it last summer. That machinery may become part of the new Los Angeles plant.

The experiments demonstrated the efficiency and economy of dust spray for aphids. Red spider also seems to be well controlled by the dust; but codling worm experiments were begun too late last spring to demonstrate

their efficiency. They will begin earlier next season. Prof. Smith hopes to get enough tobacco grown in Southern California for use in the sprays where it is required.

Individual Nuts to be Branded.

The machine for branding individual nuts with the Diamond Brand of the Association has not yet been devised, although \$10,000 awaits the successful inventor and many people have been working on the problem.

THE YUCAIPA APPLE CROP DOUBLED.

(Written for Pacific Rural Press.)

The Yucaipa Apple Growers' Association will pack 100 per cent more apples this year than last, as estimated by Secretary F. B. Henney. The pack this year is likely to total about 125,000 boxes, chiefly of Delicious, King David, Winesap, Jonathan, and Rome Beauty. The Association handles about three-fourths of the crop of the entire Valley, as it did last year. The increase is largely due to the young orchards of this district coming through with their first real heavy crop. They were well cared for, some being sprayed six or eight times. Codling worms are scarce and red spider has not bothered. There has been water enough to put the trees in good shape for next year; but growers felt the pinch and there is talk of developing more water, both by gravity flow and by pumping. The consulting engineer of the Water Co. is making an investigation now for the purpose.

Apples have been coming to the packing-house near Yucaipa since the middle of August and will continue until mid-November. As most of them are winter varieties, they are going into cold storage. The culls have been sold to the cannery at Wineville and are hauled thither by motor trucks and trailers. The cannery at Yucaipa is not running. Very few of the apples are going into cider or vinegar. The windfalls are of fine quality, quite a few having been shaken off by an unusual wind late in September.

The Apple Growers' Association packing house is a busy place these days, although a great deal of labor-saving machinery was installed this summer. Two new Cutler apple graders, an elevator, a labeling machine, and a 15-ton wagon scale are some of the improvements.

THE Y. M. C. A. AND FRUIT PICKING.

(Written for Pacific Rural Press.)

Students and young men and boys from the Y. M. C. A. have been a very important factor in harvesting the summer fruit crop. As an instance, the Losse Estate at San Jose started by getting boys and young men from the Y. M. C. A. at Oakland. This year they sent for 150 boys with their own leader, to pick the apricot crop. Six hundred tons of apricots were picked and sent to the cannery. There are 400 acres of fruit on this estate.

Good housing conditions are essential and were provided by the Losse Estate. A quantity of lumber was brought from the cottonments at Camp Fremont, and suitable quarters were erected for the pickers, who brought their own cooks and superintendent. The latter is most essential. The work and deportment of this party of young folks gave good satisfaction. It is a good outing for them, great value to the State and provides the workers with substantial funds to "carry on."

If the company wants more help, a phone message is sent to the Y. M. C. A., and it is promptly provided. The party is harmonious and business-like and the work goes right along. The system, with all educational establishments, is being widened and developed and should go far to solve the problem of supplying labor in the harvest when the demand is greatest.

The **BLASTER** says—
"I use **GIANT**
It gets them out
cleaner"

Professional blasters know explosives. They have tried all the different makes. Many of them say "Giant gets the stumps out cleaner." John Zurr of Santa Rosa, Cal., writes:

"From the beginning of the time I have been using powder for stump blasting and other agricultural work, I have found the powder made by The Giant Powder Co. to be the most satisfactory. Each certain percentage of Giant Powder is exactly what it is represented to be."

Tell your dealer you want the genuine Giant Farm Powders—Giant Stumping or Eureka Stumping. The Giant trademark on every box is your sure protection against imitations.

It will pay you to write today for our book, "Better Farming with Giant Farm Powders." It tells scores of money-saving ways of doing farm jobs—land clearing, ditching, tree planting, etc.

Use the Finest of Sublimed Sulphur

(Written for Pacific Rural Press.)

To the Editor: Just a line to ask why so much grief with sulphur for dry dusting of red spiders this season and every season. This season on my young almonds and prunes we dusted with an American dusting machine and by sack not less than six times and without any effect at all, until we got disgusted and went at the bottom of the whys and wherefores of sulphur. The merchants in this town have been selling Anchor sulphur ever since I have been using sulphur, and that has been eight years now. I took the matter up with one of the merchants here, who said he did not know of any difference in sulphur—sulphur was sulphur to him. The California Sulphur company shipped out some which was branded on the face of each sack, "Dusting Sulphur." This cooked the spider and our troubles were over for the season. Our troubles were not due to the weather conditions, as we started early in May and went back at it at regular intervals. In using the wet spray what kind of sulphur is best or can a Rex solution be used if diluted properly? Again what means should be taken and when should a person start the fight on the red-hump caterpillar on the prunes. They certainly raised the devil this season. In the past they have only hit me on the edges of the orchard.—J. H. S., Chico.

We cannot understand your getting no effect at all by dusting for red spider with sulphur, especially so since you started early in May. If

you had shaken the sulphur on with a sack, we could understand the situation, but you say you used an American dusting machine. A coarse, heavy sulphur is, of course, not nearly so effective as a finely ground sulphur, a hundred-pound sack of which will bulk half as large again as the coarse sulphur used for sulphuring dried fruit.

It is quite positive that you should have controlled the mites entirely by starting early in May and following in a week or so with subsequent dustings. Therefore, it would seem that your material was faulty—not necessarily in quality, but for the purpose.

If you want to use lime-sulphur, 2½ gallons to 100 gallons of water is all right, or you can use atomic or milled (vegetable) sulphur, say 12 pounds to 100 gallons.

The red-humped caterpillar comes in odd clusters and I have never known them to attack an entire orchard, though they are worse this year than usual. When they first appear in June and July on the young trees, the easiest way is to strip them off the branch they are on and drop them into a pan with a little water and coal oil in it. On large trees that can't be reached, spray with arsenate lead paste, 5-6 pounds to 100 gallons when they are small, or they have to eat a lot before you get them. If you get this first brood you probably won't be troubled much with the September brood.

A Large French Prune--A Sport

(Written for Pacific Rural Press.)

Never before has so much interest centered in the prune—everything connected with it, but particularly in its size. The reason for this is, of course, because of the exceptionally high basis for large sizes in addition to the extra bonus offered for them. And so everybody is keen on getting trees that produce large prunes and lots of them every year.

We were taken to the Lloyd Cox orchard at Saratoga of "Improved" prunes recently by Horticultural Commissioner Cody, and were much struck with the uniformly large size of the fruit in spite of a large crop. The trees are five years old and are planted in alternate rows with sugars—a very good combination on this class of ground and an insurance of large sizes. The prunes are round shouldered—more the shape of an Imperial, but they are true French in foliage and quality of fruit. From there we went to see the parent tree owned by F. B. Smith of Saratoga and of which mention was made in the Pacific Rural Press two years ago.

History of the Prunes.

This large prune was produced from only one branch of one particular tree and a few nursery trees were budded from the wood which had sported. Later some trees were blown out to interplant walnuts, and this tree was destroyed at the same

time by mistake, to make room for a walnut. However, one tree had been planted budded from this large prune wood, and it exists today. Its wood was contracted for five years to a prominent nurseryman. We saw in this same orchard an old peach tree that had been worked over to this prune. It was full of very large fruit and we gathered one from the ground that measured 2 inches in diameter from end to end and 1½ inches through. There were some high up in the tree that appeared still larger, though the crop was a large one. It is a good red prune and the old tree had made quite a lot of wood, besides producing a good crop of large fruit—no small ones at all. Mr. Smith said they would run 13 to the pound green!

How Orchard Is Worked.

Until two years ago this orchard of 32 acres was never irrigated. Then as the trees showed the result of dry seasons a pumping plant was installed and the whole place is thoroughly irrigated in May. This spring was delayed in plowing for three weeks because the tractor man who had contracted to do the work did not show up and a very heavy cover crop hardened up the ground and sapped the moisture. However, he irrigated immediately afterwards and the trees look well. He will sow a cover crop of vetches with the first early rains.

The Farmer's Cost of Production

To the Editor: Your issue of August 23 caused me to cry out, "Rejoice, oh, my soul; lift up the gates, for the agricultural worm has turned at last!" The farmers' demand at Washington that autocracy cease and that the Government take its clumsy hand off the farmer is the best music that has been heard for many moons. It comes just as arrangements were making to limit our prices regardless of the cost of production. Let us lift the curtain on the high cost of living. My taxes amount to 10 per cent on my income from my ranch. Last year and this on my property Japanese and Chinese farm labor is paid \$100 per month, because white men won't work. Sacks, twine, everything used in my industry, cost from 50 to 100 per cent above prices five years ago. Yet I

have been expected to sell the products of my soil at the prices of 1912! We farmers have let others dictate what kind of labor we must employ, when there is no labor of that kind to be had. All that we buy has doubled in price because the labor that produces it does one day's work for two days' pay. As our produce leaves our hands it must bring us our taxes and the cost of production and enough profit to keep our plows moving. The buyer must add to it his taxes and the two days' wage he pays for one day's work. This process must be repeated in every process of transportation and distribution, and it will go on, in spite of all statutes until we force economy in government and industrial labor is forced to work two days for two days' wages.—John P. Irish, Stockton.

PEDIGREED PRUNE TREES

When you plant prune trees, plant the best—trees that will grow, and produce, and pay! We make it a practice to bud our prune trees from parent stock of proven productiveness and quality. The scions are carefully selected by trained experts and the budding is done in the most skillful and scientific way.

California Nursery Company
NILES, California
P. O. BOX 404

HORTICULTURAL JOTTINGS.

A firm at Lodi has tried shipping grapes to Chicago in a box car.

El Quito olive orchard in Santa Clara county was sold recently for \$80,000 to G. Brucia.

Thirteen hundred carloads of fresh fruit left California during one week in August, it is said.

It is said that the demand for cars this season in California has shown a growth of 500 per cent.

Thirty-five thousand cash has been paid for a forty-acre peach orchard in Sutter county, it is said.

Live Oak (Sutter county) is hoping to establish a cannery to take care of next year's crop of peaches, etc.

A good many cider mills are being sold through the State, it is said. Their use has not yet been "verboten."

"Malaga grape shipments are in full blast and the quality is good," says A. L. Rutherford of Stanislaus county. There is little trouble in inspection.

Orange shippers at Porterville have been assured by railroad officials that there will be plenty of cars for transporting the coming citrus crop.

Yucaipa Valley (San Bernardino county) will have a crop of more than 250,000 boxes of apples this year. Apple packing is proceeding rapidly.

During the past three months shipments of products from California were almost 50 per cent greater than for the corresponding period last year.

The general effect of the war in Italy on the lemon industry has been decreased exports. Box prices have doubled and cost of labor trebled since 1914.

The State's pear crop for this season yields \$7,000,000 approximately, according to Frank T. Swett, President of the California Pear Growers' Association.

The wholly unprecedented quantity of wine grapes shipped, which was formerly made into wine, has helped to create a demand for which, even in normal times, cars could not be built fast enough.

Quite a little activity in prospective peach planting is reported in Porterville (Tulare county). The demand for dried peaches is steady and satisfactory. Dried fruit is moving as fast as circumstances permit.

Mr. Hinsey, manager of the Almond Growers' Association at Fair Oaks (Sacramento county) reports about 85 per cent of a crop. The almonds are of excellent quality and in strong demand. Harvest is about over.

George W. Whitman, a prominent fruit grower of Ygnacio Valley (Contra Costa county) has just died at the age of 45. He came here in 1881 and was a pioneer and a leader in every progressive movement, especially in the fruit industry.

The McHenry Bros. of Modesto (Bald Eagle Ranch) will have about 240 tons of dried figs from their 40 acres of bearing trees. This at 17 cents a pound means big business. This orchard is the oldest and best kept in the county.

The rather unusual number of split oranges appearing this year may develop sufficiently to use in the marmalade and by-product factories. The theory for this condition in the fruit is unevenness of soil moisture through the season.

Practically all Lake county pears have been dried this season. There has been no inducement to ship. Nearly all pear orchards were "strawed" this year to prevent bruising of windfalls, according to Horticultural Commissioner Stokes.

The State's peach crop will reach about 435,000 tons, according to E. E. Kaufman, Bureau of Crop Estimates, the reduction being chiefly due to shortage of water in some districts. The season has been successful, though there was some delay due to labor shortage.

Now, Mr. Consumer, look at our figures in last week's issue and note that Imperial county's cantaloupe crop sold for \$9,208,080, out of which the grower netted \$1,710,072. The growers made a fair wage and the

rest of the money helped to provide a fair wage for getting it to market to those engaged in the transportation business.

Healdsburg wineries plan to crush grapes for growers, allowing the latter 100 gallons of wine per ton of grapes delivered. If wartime prohibition is lifted in time the wine can be sold in 30 days; otherwise it will be denatured under the new process. In case of loss, both sides of the contract carry their own troubles.

Alameda county has never had a more promising outlook for grape men. Growers are finding a ready market at good prices. One grower, who has 400 acres in grapes, sold his entire crop to an Eastern firm to be packed in Los Angeles lugs for shipment. "We can grow the stuff—it is up to the other man to carry it away."

One hundred and sixty thousand people paid for admission to the State Fair this year. In spite of the fact that grape and prune growers were in the midst of harvest, and many peach, apple and pear men were still busy, the money taken at the gate was \$14,000 more than last year, according to Geo. C. Roeding, President of the State Agricultural Association.
